Slew Rate Controlled Load Switch

FEATURES

- **1.8 V to 5.5 V Input Voltage range**
- **Very Low $R_{DS(ON)}$, typically 80 mΩ (5 V)**
- Slew rate limited turn-on time options
  - SiP4280-1: 1 ms
  - SiP4280-3: 100 µs
- Fast shutdown load discharge option
- Low quiescent current
- 4 kV ESD Rating
- 6 pin SOT23 package

APPLICATIONS

- Cellular telephones
- Digital still cameras
- Personal digital assistants (PDA)
- Hot swap supplies
- Notebook computers
- Personal communication devices

DESCRIPTION

The SiP4280 is a P-Channel MOSFET power switch designed for high-side load switching applications. The output pass transistor is a P-Channel MOSFET transistor with typically 80 mΩ $R_{DS(ON)}$. The SiP4280 is available in two different versions of turn-on times. The SiP4280-1 version has a slew rate limited turn-on time typically of 1 ms. The SiP4280-3 version has a slew rate limited turn-on time typically of 100 µs and additionally offers a shutdown load discharge circuit to rapidly turn off a load circuit when the switch is disabled.

Both SiP4280 load switch versions operate with an input voltage ranging from 1.8 V to 5.5 V, making them ideal for both 3 V and 5 V applications. The SiP4280 also features an under-voltage lock out which turns the switch off when an input undervoltage condition exists. Input logic levels are TTL and 2.5 V to 5.0 V CMOS compatible. The quiescent supply current is very low, typically 2.5 µA. In shutdown mode, the supply current decreases to less than 1.0 µA.

The SiP4280 is available in a 6 pin SOT23 package and is specified over - 40 °C to 85 °C temperature range.

DETAILED DESCRIPTION

The SiP4280 is a P-Channel MOSFET power switches designed for high-side slew rate controlled load switching applications. Once turned on, the slew-rate control circuitry is activated and current is ramped in a linear fashion until it reaches the level required for the output load condition. This is accomplished by first elevating the gate voltage of the MOSFET up to its threshold voltage and then by linearly increasing the gate voltage until the MOSFET becomes fully enhanced. At this point, the gate voltage is then quickly increased to the full input voltage to reduce $R_{DS(ON)}$ of the MOSFET switch and minimize any associated power losses.

The SiP4280-1 version has a modest 1 ms turn on slew rate feature, which significantly reduces in-rush current at turned on time and permits the load switch to be implemented with a small input capacitor, or no input capacitor at all, saving cost and space. In addition to a 100 µs minimized slew rate, the SIP4280-3 features a shutdown output discharge circuit which is activated at shutdown (when the part is disabled through the ON/OFF pin) and discharges the output pin through a small internal resistor hence, turning off the load.

In instances where the input voltage falls below 1.4 V (typically) the under voltage lock-out circuitry protects the MOSFET switch from entering the saturation region or operation by shutting down the chip.

APPLICATION INFORMATION

Input Capacitor

While a bypass capacitor on the input is not required, a 1 µF or larger capacitor for CIN is recommended in almost all applications. The Bypass capacitor should be placed as physically close as possible to the SiP4280 to be effective in minimizing transients on the input. Ceramic capacitors are recommended over tantalum because of their ability to withstand input current surges from low impedance sources such as batteries in portable devices.

Output Capacitor

A 0.1 µF capacitor or larger across V_{OUT} and GND is recommended to insure proper slew operation. C_{OUT} may be increased without limit to accommodate any load transient condition with only minimal affect on the SiP4280 turn on slew rate time. There are no ESR or capacitor type requirement.

Enable

The ON/OFF pin is compatible with both TTL and CMOS logic voltage levels.

Reverse Voltage Conditions and Protection

The P-Channel MOSFET pass transistor has an intrinsic diode that is reversed biased when the input voltage is greater than the output voltage. Should V_{OUT} exceed V_{IN} , this intrinsic diode will become forward biased and allow excessive current to flow into the IC thru the V_{OUT} pin and potentially damage the IC device. Therefore extreme care should be taken to prevent V_{OUT} from exceeding V_{IN}.

In conditions where V_{OUT} exceeds V_{IN} a Schottky diode in parallel with the internal intrinsic diode is recommended to protect the SiP4280.
