APPLICATION NOTE

Electronic equipment is susceptible to damage caused by Electrostatic Discharge (ESD), Electrical Fast Transients (EFT), and tertiary lightning effects. Knowing that equipment can be damaged, the SLVU2.8-8 was designed to provide the level of protection required to safeguard sensitive equipment. This product can be used in different configurations to provide a level of protection to meet bidirectional requirements either in a common-mode or differential-mode configuration.

BIDIRECTIONAL COMMON-MODE CONFIGURATION (Figure 1)

The SLVU2.8-8 provides up to four lines of protection in a common-mode configuration as depicted in figure 1.

Circuit connectivity is as follows:

- ✓ Line 1 is connected to Pin 1
- ✓ Line 2 is connected to Pin 8
- ✓ Line 3 is connected to Pin 5
- ✓ Line 4 is connected to Pin 4
- ✓ Pins 2, 3, 6 and 7 are connected to ground

BIDIRECTIONAL DIFFERENTIAL-MODE CONFIGURATION (Figure 2)

The SLVU2.8-8 provides up to four line pairs of protection in a differential-mode configuration as depicted in figure 2.

Circuit connectivity is as follows:

- ✓ Line Pair 1 is connected to Pins 1 & 2
- ✓ Line Pair 2 is connected to Pins 3 & 4
- ✓ Line Pair 3 is connected to Pins 7 & 8
- ✓ Line Pair 4 is connected to Pins 5 & 6

CIRCUIT BOARD LAYOUT RECOMMENDATIONS

Circuit board layout is critical for Electromagnetic Compatibility (EMC) protection. The following guidelines are recommended:

- ✓ The protection device should be placed near the input terminals or connectors, the device will divert the transient current immediately before it can be coupled into the nearby traces.
- ✓ The path length between the TVS device and the protected line should be minimized.
- ✓ All conductive loops including power and ground loops should be minimized.
- ✓ The transient current return path to ground should be kept as short as possible to reduce parasitic inductance.
- ✓ Ground planes should be used whenever possible. For multilayer PCBs, use ground vias.
