

DC to DC Converter Controller

FEATURES

- operation from 3.0 to 40V input
- short circuit current limiting
- low standby current
- output switch current of 1.5A
- output voltage adjustable
- frequency of operation from 100Hz to 100KHz
- step-up, step-down or inverting switching regulators
- current limiting

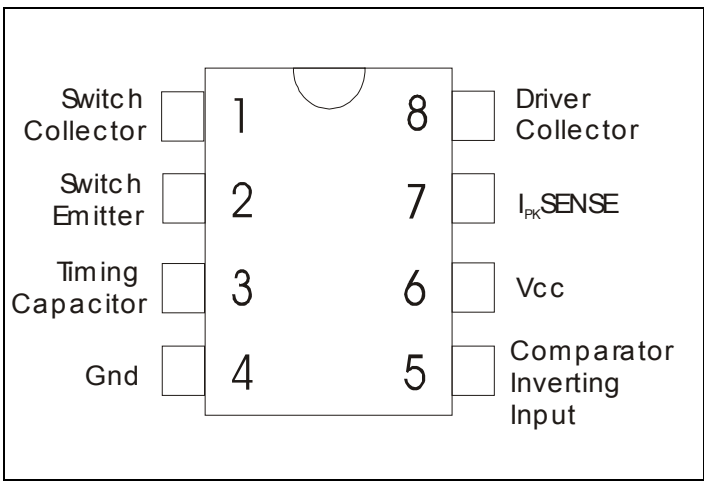

PRODUCT DESCRIPTION

The SM34063 is a monolithic control circuit containing the primary functions required for DC-to-DC converters. This device consists of an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit, driver and high current output switch.

This device was specifically designed to be incorporated in Step-Down and Step-Up and Voltage-inverting applications with a minimum number of external components.

- NOTES:
- $T_{low}=0^\circ C$ $T_{high}=+70^\circ C$
 - Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible.
 - If the output switch is driven into hard saturation (non-Darlington) at low switch currents ($\leq 300mA$) and high driver currents ($\geq 30mA$), it may take up to $2.0\mu s$ for it to come out of saturation. This condition will shorten the off time at frequencies $\geq 30kHz$, and is magnified at high temperature. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non-Darlington configuration is used, the following output drive condition is recommended:

$$\text{Forced } \beta \text{ of output switch: } \frac{I_C \text{ output}}{I_C \text{ driver} - 7.0mA} \geq 10$$

*The 100Ω resistor in the emitter of the driver device requires about $7.0mA$ before the output switch conducts.

Fig 13. Design Formula Table

V_{sat} = Saturation voltage of the output switch.

V_F = Forward voltage drop of the output rectifier.

The following power supply characteristics must be chosen:

V_{in} – Nominal input voltage.

V_{out} – Desired output voltage, $|V_{out}| = 1.25(1 + \frac{R_2}{R_1})$

I_{out} – Desired output current.

f_{min} – Minimum desired output switching frequency at the selected values of V_{in} and I_O .

$V_{ripple(p-p)}$ – Desired peak-to-peak output ripple voltage. In practice, the calculated capacitor value will need to be increased due

to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
