Description

The SM39R08A3 is a 1T (one machine cycle per clock) single-chip 8-bit microcontroller. It has 8KB+1KB embedded Flash for program, and executes all ASM51 instructions fully compatible with MCS-51.

SM39R08A3 contains 512B on-chip RAM, up to 18 GPIOs (20L package), various serial interfaces and many peripheral functions as described below. It can be programmed via writers. Its on-chip ICE is convenient for users in verification during development stage.

The high performance of SM39R08A3 can achieve complicated manipulation within short time. About one third of the instructions are pure 1T, and the average speed is 8 times of traditional 8051, the fastest one among all the 1T 51-series.Its excellent EMI and ESD characteristics are advantageous for many different applications.

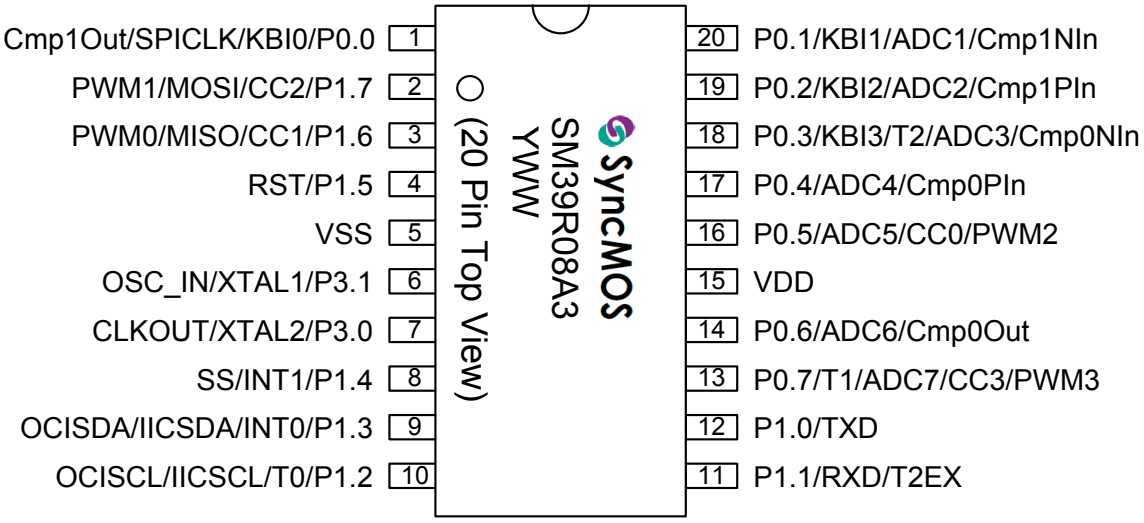
Features

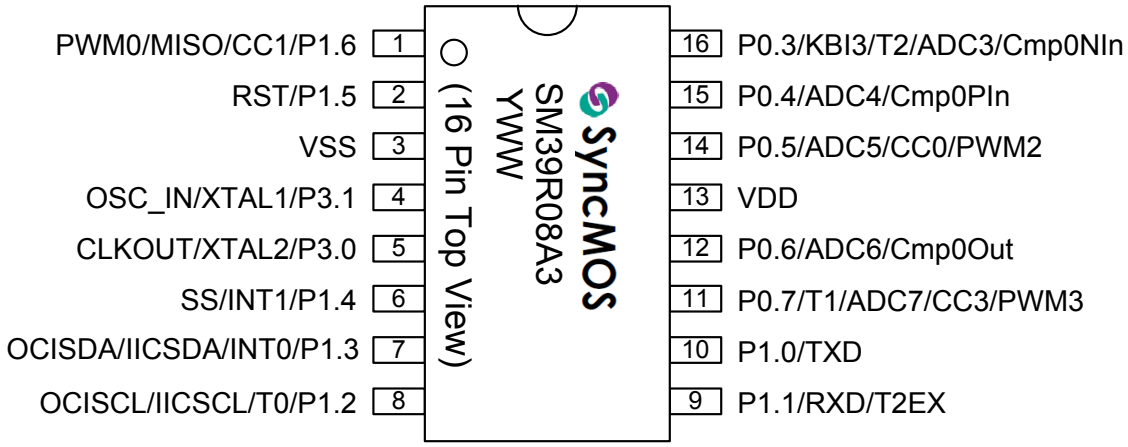
- Operating Voltage:1.8V ~ 5.5V
- High speed architecture of 1 clock/machine cycle runs up to 25MHz.
- 1~8T can be switched on the fly.
- Instruction-set compatible with MCS-51.
- 22.1184MHz Internal RC oscillator, with programmable clock divider
- 8KB+1KB on-chip program memory.
- 512B RAM as standard 8052,
- Dual 16-bit Data Pointers (DPTR0 & DPTR1).
- One serial peripheral interfaces in full duplex mode.
- Additional Baud Rate Generator
- Three 16-bit Timer/Counters. (Timer 0,1,2）
- 12 ~18 GPIOs(14L ~ 20L package)
- External interrupt 0,1 with four priority levels
- Programmable watchdog timer.
- One IIC interface. (Master/Slave mode)
- One SPI interface (Master/Slave mode)
- 4-channel PWM
- 4-channel 16-bit PCA for compare(PWM) / capture / reload functions
- 7-channel 10-bit analog-to-digital converter (ADC) and 1-channel ADC0 connect to internal reference voltage
- CMP x1 Set (2 devices)
- ISP/IAP/ICP functions.
- ISP service program space configurable in N*128 byte (N=0 to 8) size.
- EEPROM function.
- On-Chip in-circuit emulator (ICE) functions with On-Chip Debugger (OCD).
- Keyboard interface (KBI) for four more interrupts.
- LVI/LVR (LVR deglitch 500ns)
- IO PAD ESD over 4KV
- Enhance user code protection.
- Power management unit for IDLE and power down modes.

Pin Configuration

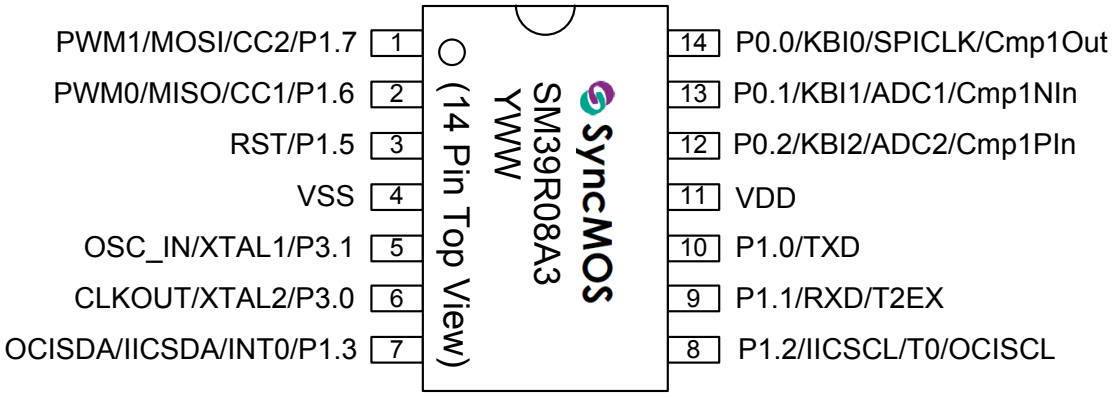
20 Pin PDIP/SOP/SSOP



16 Pin SOP



14 Pin SOP



Notes：

(1) The pin Reset/P1.5 factory default is GPIO (P1.5), user must keep this pin at low during power-up. User can configure it to Reset by a flash programmer.

(2) To avoid accidentally entering ISP-Mode(refer to section 18.4), care must be taken not asserting pulse signal at RXD P1.1 during power-up while P1.6 are set to high.

(3) To apply ICP function, OSI_SDA/P1.3 and OCI_SCL/P1.2 must be set to Bi-direction mode if they are configured as GPIO in system.

Function Description

1. General Features

SM39R08A3 is an 8-bit micro-controller. All of its functions and the detailed meanings of SFR will be given in the following sections.

1.1 Embedded Flash

The program can be loaded into the embedded 8KB+1KB Flash memory via its writer or In-System Programming (ISP). The high-quality Flash has a 100K-write cycle life, suitable for re-programming and data recording as EEPROM.

1.2 IO Pads

The SM39R08A3 has Three I/O ports: Port 0, Port 1 and Port 3. Ports 0, 1 are 8-bit ports and Port 3 is a 2-bit port. These are: quasi-bidirectional (standard 8051 port outputs), push-pull, open drain, and input-only. As description in section 5.

All the pads for P0, P1 and P3 are with slew rate to reduce EMI. The IO pads can withstand 4KV ESD in human body mode guaranteeing the SM39R08A3 is quality in high electro-static environments.

The RESET Pin can define as General I/O P1.5 when user use Internal RESET.

The XTAL2 and XTAL1 can define as P3.0 and P3.1 by writer or ISP, when user use internal OSC as system clock; when user use external OSC as system clock and input into XTAL1, only XTAL2 can be defined as P3.0.

1.3 Instruction timing Selection

The conventional 52-series MCUs are 12T, i.e., 12 oscillator clocks per machine cycle. SM39R08A3 is a 1T to 8T MCU, i.e., its machine cycle is one-clock to eight-clock. In the other words, it can execute one instruction within one clock to only eight clocks.

Mnemonic: CKCON **Address: 8Eh**

7	6	5	4	3	2	1	0	Reset
-	ITS[2:0]			-	-	CLKOUT[1:0]		10H

ITS: Instruction timing select.

ITS [2:0]	Instruction timing
000	1T mode
001	2T mode (default)
010	3T mode
011	4T mode
100	5T mode
101	6T mode
110	7T mode
111	8T mode

The default is in 2T mode, and it can be changed to another Instruction timing mode if CKCON [6:4] (at address 8Eh) is change any time. Not every instruction can be executed with one machine cycle. The exact machine cycle number for all the instructions are given in the next section.

1.4 The Clock Out Selection

The SM39R08A3 can Generator a clock out signal at P3.0， when user use Oscillator (XTAL1 as clock input) or internal OSC as system clock. The CKCON [1:0] (at address 8Eh) can change any time.

CLKOUT: Clock output select.

CKCON [1:0]	Mode.
00	GPIO(default)
01	Fosc
10	Fosc/2
11	Fosc/4

1.5 RESET

1.5.1 Hardware RESET function

SM39R08A3 provides Internal reset circuit inside，the Internal reset time can set by writer or ISP.

Internal Reset time
25ms (default)
200ms
100ms
50ms
16ms
8ms
4ms

1.5.2 Software RESET function

SM39R08A3 provides one software reset mechanism to reset whole chip. To perform a software reset, the firmware must write three specific values 55h, AAh and 5Ah sequentially to the TAKEY register to enable the Software Reset register (SWRES) write attribute. After SWRES register obtain the write authority, the firmware can write FFh to the SWRES register. The hardware will decode a reset signal that “OR” with the other hardware reset. The SWRES register is self-reset at the end of the software reset procedure.

Mnemonic	Description	Address	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	RST
Software Reset function											
RSTS	Reset status register	A1h	-	-	-	PDRF	WDTF	SWRF	LVRF	PORF	00H
TAKEY	Time Access Key register	F7h	TAKEY [7:0]								00H
SWRES	Software Reset register	E7h	SWRES [7:0]								00H

1.5.3 Reset status

Mnemonic: RSTS **Address: A1h**

7	6	5	4	3	2	1	0	Reset
-	-	-	PDRF	WDTF	SWRF	LVRF	PORF	00H

PDRF: Pad reset flag.

When MCU is reset by reset pad, PDRF flag will be set to one by hardware. This flag clear by software.

WDTF: Watchdog timer reset flag.

When MCU is reset by watchdog, WDTF flag will be set to one by hardware. This flag clear by software.

SWRF: Software reset flag.

When MCU is reset by software, SWRF flag will be set to one by hardware. This flag clear by software.

LVRF: Low voltage reset flag.

When MCU is reset by LVR, LVRF flag will be set to one by hardware. This flag clear by software.

PORF: Power on reset flag.

When MCU is reset by POR, PORF flag will be set to one by hardware. This flag clear by software.

1.5.4 Time Access Key register (TAKEY)

Mnemonic: TAKEY **Address: F7H**

7	6	5	4	3	2	1	0	Reset
TAKEY [7:0]								00H

Software reset register (SWRES) is read-only by default; software must write three specific values 55h, AAh and 5Ah sequentially to the TAKEY register to enable the SWRES register write attribute. That is:

```
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah
```

1.5.5 Software Reset register (SWRES)

Mnemonic: SWRES **Address: E7H**

7	6	5	4	3	2	1	0	Reset
SWRES [7:0]								00H

SWRES[7:0]: Software reset register bit. These 8-bit is self-reset at the end of the reset procedure.

SWRES [7:0] = FFh, software reset.

SWRES [7:0] = 00h ~ FEh, MCU no action.

1.5.6 Example of software reset

```
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah; enable SWRES write attribute
MOV SWRES, #0FFh ; software reset MCU
```

1.6 Clocks

The default clock is the 22.1184MHz Internal OSC. This clock is used during the initialization stage. The major work of the initialization stage is to determine the clock source used in normal operation.

The internal clock sources are from the internal OSC with difference frequency division as given in Table 1-1, the clock source can set by writer or ICP.

Table 1-1: Selection of clock source

Clock source
external crystal (use XTAL1 and XTAL2 pins)
external crystal/2 (use XTAL1 and XTAL2 pins)
external crystal/4 (use XTAL1 and XTAL2 pins)
external crystal (only use XTAL1, the XTAL2 define as I/O)
22.1184MHz from internal OSC
11.0592MHz from internal OSC
5.5296MHz from internal OSC
2.7648MHz from internal OSC
1.3824MHz from internal OSC

There may be having a little variance in the frequency from the internal OSC. The max variance as giving in Table 1-2

Table 1-2: Temperature with variance

Temperature	Max Variance
25℃	±2%

2. Instruction Set

All SM39R08A3 instructions are binary code compatible and perform the same functions as they do with the industry standard 8051. The following tables give a summary of the instruction set cycles of the SM39R08A3 Microcontroller core.

3. Memory Structure

The SM39R08A3 memory structure follows general 8052 structure. It is 8KB+1KB program memory.

3.1 Program Memory

The SM39R08A3 has 8KB+1KB on-chip flash memory which can be used as general program memory or EEPROM, on which include up to 1K byte specific ISP service program memory space. The address range for the 8K byte is $0000 to $1FFF. The address range for the ISP service program is $3C00 to $3FFF. The ISP service program size can be partitioned as N blocks of 128 byte (N=0 to 8). When N=0 means no ISP service program space available, total 8KB+1KB memory used as program memory. When N=1 means address $3F80 to $3FFF reserved for ISP service program. When N=2 means memory address $3F00 to $3FFF reserved for ISP service program…etc. Value N can be set and programmed into SM39R08A3 by the writer or ICP. It can be used to record any data as EEPROM(If you need modify the data on program memory, please page erase first). The procedure of this EEPROM application function is described in the section 18 on internal ISP.

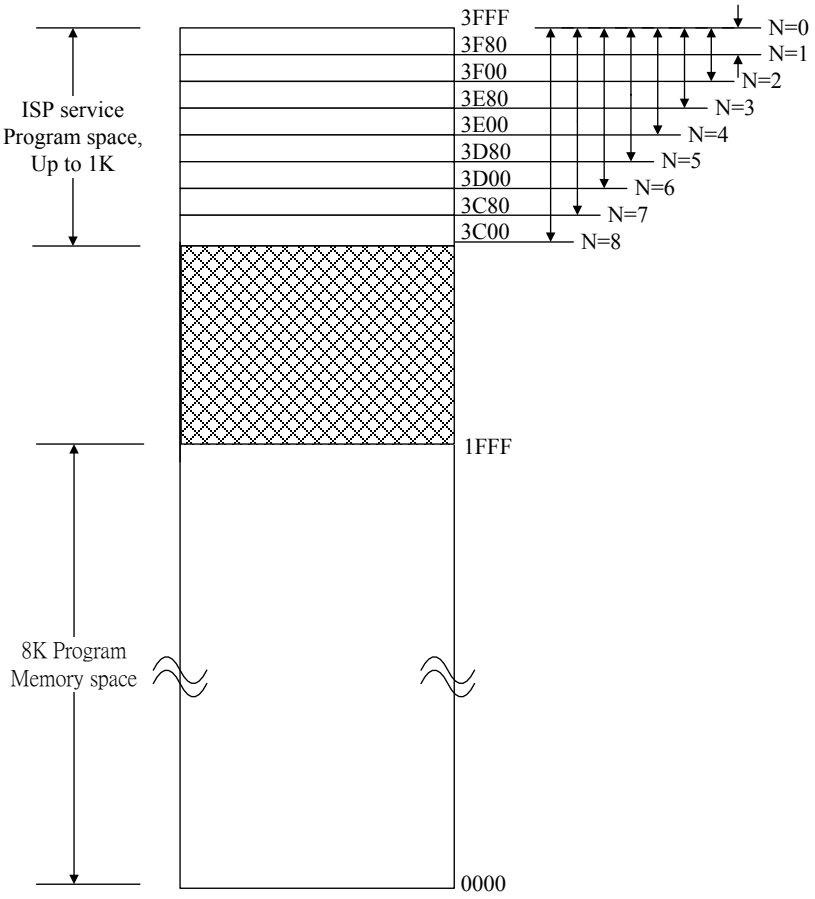

Fig. 3-1: SM39R08A3 programmable Flash

3.2 Data Memory

The SM39R08A3 has 512B on-chip SRAM; as below Fig. 3-2; 256 Bytes of it are the same as general 8052 internal memory structure.

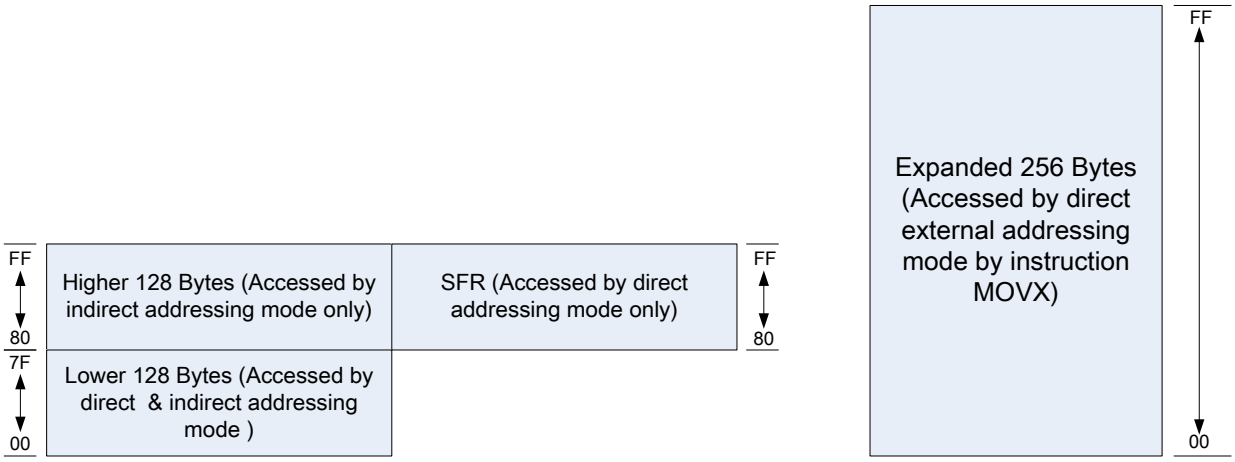

Fig. 3-2: RAM architecture

3.3 Data memory - lower 128 byte (00h to 7Fh)

Data memory 00h to FFh is the same as 8052.
The address 00h to 7Fh can be accessed by direct and indirect addressing modes.
Address 00h to 1Fh is register area.
Address 20h to 2Fh is memory bit area.
Address 30h to 7Fh is for general memory area.

3.4 Data memory - higher 128 byte (80h to FFh)

The address 80h to FFh can be accessed by indirect addressing mode.
Address 80h to FFh is data area.

3.5 Data memory - Expanded 256 bytes ($00 to $FF)

From external address 00h to FFh is the on-chip expanded SRAM area, total 256 Bytes. This area can be accessed by external direct addressing mode (by instruction MOVX).

4. CPU Engine

The SM39R08A3 engine is composed of four components:

(1) Control unit
(2) Arithmetic – logic unit
(3) Memory control unit
(4) RAM and SFR control unit

The SM39R08A3 engine allows to fetch instruction from program memory and to execute using RAM or SFR. The following chapter describes the main engine register.

Mnemonic	Description	Dir.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	RST

4.1 Accumulator

ACC is the Accumulator register. Most instructions use the accumulator to store the operand.

Mnemonic: ACC **Address: E0h**

7	6	5	4	3	2	1	0	Reset
ACC.7	ACC.6	ACC05	ACC.4	ACC.3	ACC.2	ACC.1	ACC.0	00h

ACC[7:0]: The A (or ACC) register is the standard 8052 accumulator。

4.2 B Register

The B register is used during multiply and divide instructions. It can also be used as a scratch pad register to store temporary data.

Mnemonic: B **Address: F0h**

7	6	5	4	3	2	1	0	Reset
B.7	B.6	B.5	B.4	B.3	B.2	B.1	B.0	00h

B[7:0]: The B register is the standard 8052 register that serves as a second accumulator.

4.3 Program Status Word

Mnemonic: PSW **Address: D0h**

7	6	5	4	3	2	1	0	Reset
CY	AC	F0	RS [1:0]		OV	F1	P	00h

CY: Carry flag.

AC: Auxiliary Carry flag for BCD operations.

F0: General purpose Flag 0 available for user.

RS[1:0]	Bank Selected	Location
00	Bank 0	00h – 07h
01	Bank 1	08h – 0Fh
10	Bank 2	10h – 17h
11	Bank 3	18h – 1Fh

OV: Overflow flag.

F1: General purpose Flag 1 available for user.

P: Parity flag, affected by hardware to indicate odd/even number of “one” bits in the Accumulator, i.e. even parity

4.4 Stack Pointer

The stack pointer is a 1-byte register initialized to 07h after reset. This register is incremented before PUSH and CALL instructions, causing the stack to start from location 08h.

Mnemonic: SP **Address: 81h**

7	6	5	4	3	2	1	0	Reset
SP [7:0]								07h

SP[7:0]: The Stack Pointer stores the scratchpad RAM address where the stack begins. In other words, it always points to the top of the stack.

4.5 Data Pointer

The data pointer (DPTR) is 2-bytes wide. The lower part is DPL, and the highest is DPH. It can be loaded as a 2-byte register (e.g. MOV DPTR, #data16) or as two separate registers (e.g. MOV DPL,#data8). It is generally used to access the external code or data space (e.g. MOVC A, @A+DPTR, @DPTR respectively).

Mnemonic: DPL **Address: 82h**

7	6	5	4	3	2	1	0	Reset
DPL [7:0]								00h

DPL[7:0]: Data pointer Low 0

Mnemonic: DPH **Address: 83h**

7	6	5	4	3	2	1	0	Reset
DPH [7:0]								00h

DPH [7:0]: Data pointer High 0

4.6 Data Pointer 1

The Dual Data Pointer accelerates the moves of data block. The standard DPTR is a 16-bit register that is used to address external memory or peripherals. In the SM39R08A3 core the standard data pointer is called DPTR, the second data pointer is called DPTR1. The data pointer select bit chooses the active pointer. The data pointer select bit is located in LSB of AUX register (DPS).

The user switches between pointers by toggling the LSB of AUX register. All DPTR-related instructions use the currently selected DPTR for any activity.

Mnemonic: DPL1 **Address: 84h**

7	6	5	4	3	2	1	0	Reset
DPL1 [7:0]								00h

DPL1[7:0]: Data pointer Low 1

Mnemonic: DPH1 **Address: 85h**

7	6	5	4	3	2	1	0	Reset
DPH1 [7:0]								00h

DPH1[7:0]: Data pointer High 1

Mnemonic: AUX **Address: 91h**

7	6	5	4	3	2	1	0	Reset
BRGS	-	-	-	-	-	-	DPS	00H

DPS: Data Pointer select register.

DPS = 1 is selected DPTR1.

4.7 Clock control register

Mnemonic: CKCON **Address: 8Eh**

7	6	5	4	3	2	1	0	Reset
-	ITS[2:0]			-	-	CLKOUT[1:0]		10H

ITS[2:0]: Instruction timing select.

ITS [2:0]	Mode
000	1T mode
001	2T mode (default)
010	3T mode
011	4T mode
100	5T mode
101	6T mode
110	7T mode
111	8T mode

CLKOUT: Clock output select.

CKCON [1:0]	Mode.
00	GPIO(default)
01	Fosc
10	Fosc/2
11	Fosc/4

It can be used when the system clock is the internal RC oscillator.

4.8 Interface control register

Mnemonic: IFCON **Address: 8Fh**

7	6	5	4	3	2	1	0	Reset
-	CDPR	-	-	-	-	-	ISPE	00H

CDPR: Code protect (Read Only)

ISPE: ISP function enable bit

ISPE = 1, enable ISP function

ISPE = 0, disable ISP function

5. GPIO

5.1 SFR Setting Method

The SM39R08A3 has three I/O ports: Port 0, Port 1, and Port 3. Ports 0, 1 are 8-bit ports and Port 3 is a 2-bit port. These are: quasi-bidirectional (standard 8051 port outputs), push-pull, open drain, and input-only. Two configuration registers for each port select the output type for each port pin. All I/O port pins on the SM39R08A3 may be configured by software to one of four types on a pin-by-pin basis, shown as below:

Mnemonic	Description	Dir.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	RST
I/O port function register											
P0M0	Port 0 output mode 0	D2h	P0M0 [7:0]								00H

P1M0	Port 1 output mode 0	D4h	P1M0[7:0]								00H
P1M1	Port 1 output mode 1	D5h	P1M1[7:0]								00H
P3M0	Port 3 output mode 0	DAh							P3M0[1:0]		00H
P3M1	Port 3 output mode 1	DBh							P3M1[1:0]		00H

PxM1.y	PxM0.y	Port output mode
0	0	Quasi-bidirectional (standard 8051 port outputs) (pull-up)
0	1	Push-pull
1	0	Input only (high-impedance)
1	1	Open drain

The RESET Pin can define as General I/O P1.5 when user use Internal RESET.

The XTAL2 and XTAL1 can define as P3.0 and P3.1 by writer or ISP, when user use internal OSC as system clock; when user use external OSC as system clock and input into XTAL1, Only XTAL2 can be defined as P3.0.

For general-purpose applications, every pin can be assigned to either high or low independently as given below:

Mnemonic	Description	Dir.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	RST
Ports											
Port 3	Port 3	B0h	-	-	-	-	-	-	P3.1	P3.0	FFh

Mnemonic: P1 **Address: 90h**

7	6	5	4	3	2	1	0	Reset
P1.7	P1.6	P1.5	P1.4	P1.3	P1.2	P1.1	P1.0	FFh

P1.7~ 0: Port1[7] ~ Port1[0]

Mnemonic: P3 **Address: B0h**

7	6	5	4	3	2	1	0	Reset
-	-	-	-	-	-	P3.1	P3.0	FFh

P3.1~ 0: Por3[1] ~ Port3[0]

5.2 Software of Writer Setting Method

Please Setting the “IO Output Mode" item in the "Configuration" window, it can change the I/O mode of P0~P3 to the “Quasi-bidirectional (standard 8051 port outputs) (pull-up)” or Input only (high-impedance) mode, When MCU after reset and initial. It is supported the version H of MCU after.

6. Timer 0 and Timer 1

The SM39R08A3 has three 16-bit timer/counter registers: Timer 0, Timer 1 and Timer 2. All can be configured for counter or timer operations.

In timer mode, the Timer 0 register or Timer 1 register is incremented every 1/12/96 machine cycles, which means that it counts up after every 1/12/96 periods of the clk signal. It's dependent on SFR(PFCON).

In counter mode, the register is incremented when the falling edge is observed at the corresponding input pin T0or T1. Since it takes 2 machine cycles to recognize a 1-to-0 event, the maximum input count rate is 1/2 of the oscillator frequency. There are no restrictions on the duty cycle, however to ensure proper recognition of 0 or 1 state, an input should be stable for at least 1 machine cycle.

Four operating modes can be selected for Timer 0 and Timer 1. Two Special Function registers (TMOD and TCON) are used to select the appropriate mode.

Mnemonic	Description	Dir.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	RST
Timer 0 and 1											
TL0	Timer 0, low byte	8Ah	TL0[7:0]								00H

TCON	Timer/Counter Control	88h	TF1	TR1	TF0	TR0	IE1	IT1	IE0	IT0	00H
PFCON	Peripheral Frequency control register	D9h	-	-	SRELPS[1:0]		T1PS[1:0]		T0PS[1:0]		00H

6.1 Timer/counter mode control register (TMOD)

Mnemonic: TMOD **Address: 89h**

7	6	5	4	3	2	1	0	Reset
GATE	C/T	M1	M0	GATE	C/T	M1	M0	00h
Timer 1				Timer 0				

GATE: If set, enables external gate control (pin INT0 or INT1 for Counter 0 or 1, respectively). When INT0 or INT1 is high, and TRx bit is set (see TCON register), a counter is incremented every falling edge on T0 or T1 input pin.

C/T: Selects Timer or Counter operation. When set to 1, a counter operation is performed, when cleared to 0, the corresponding register will function as a timer.

M[1:0]: Selects mode for Timer/Counter 0 or Timer/Counter 1

M1	M0	Mode	Function
0	0	Mode0	13-bit counter/timer, with 5 lower bits in TL0 or TL1 register and 8 bits in TH0 or TH1 register (for Timer 0 and Timer 1, respectively). The 3 high order bits of TL0 and TL1 are hold at zero.
0	1	Mode1	16-bit counter/timer.
1	0	Mode2	8 -bit auto-reload counter/timer. The reload value is kept in TH0 or TH1, while TL0 or TL1 is incremented every machine cycle. When TLx overflows, a value from THx is copied to TLx.
1	1	Mode3	If Timer 1 M1 and M0 bits are set to 1, Timer 1 stops. If Timer 0 M1 and M0 bits are set to 1, Timer 0 acts as two independent 8 bit timers / counters.

6.2 Timer/counter control register (TCON)

Mnemonic: TCON **Address: 88h**

7	6	5	4	3	2	1	0	Reset
TF1	TR1	TF0	TR0	IE1	IT1	IE0	IT0	00h

TF1: Timer 1 overflow flag set by hardware when Timer 1 overflows. This flag can be cleared by software and is automatically cleared when interrupt is processed.

TR1: Timer 1 Run control bit. If cleared, Timer 1 stops.

TF0: Timer 0 overflow flag set by hardware when Timer 0 overflows. This flag can be cleared by software and is automatically cleared when interrupt is processed.

TR0: Timer 0 Run control bit. If cleared, Timer 0 stops.

IE1: Interrupt 1 edge flag. Set by hardware, when falling edge on external pin INT1 is observed. Cleared when interrupt is processed.

IT1: Interrupt 1 type control bit. Selects falling edge or low level on input pin to cause interrupt. IT1=1, interrupt 1 select falling edge trigger. IT1=0, interrupt1 select low level trigger.

IE0: Interrupt 0 edge flag. Set by hardware, when falling edge on external pin INT0 is observed. Cleared when interrupt is processed.

IT0: Interrupt 0 type control bit. Selects falling edge or low level on input pin to cause interrupt. IT0=1, interrupt 0 select falling edge trigger. IT0=0, interrupt 0 select low level trigger.

6.3 Enhance Interrupt Trigger SFR(ENHIT)

Mnemonic: ENHIT **Address: E5h**

7	6	5	4	3	2	1	0	Reset
-	ENHIT1	-	ENHIT0	-	-	-	-	07H

Note: It is supported the version H of MCU after.

ENHIT1: Interrupt 1 edge trigger control bit.

When ENHIT1 is set to 0 and IT1 is set to 1, The method of edge trigger is falling edge trigger.

When ENHIT1 and IT1 both are set to 1, The method of edge trigger is rising edge trigger.

	ENHIT1=0	**ENHIT1=1**
IT1=0	INT1 low level trigger	INT1 low level trigger
IT1=1	INT1 failing edge trigger	INT1 rising edge trigger

ENHIT0: Interrupt 0 edge trigger control bit.

When ENHIT0 is set to 0 and IT0 is set to 1, The method of edge trigger is falling edge trigger.

When ENHIT0 and IT0 both are set to 1, The method of edge trigger is rising edge trigger.

	ENHIT0=0	**ENHIT0=1**
IT0=0	INT0 low level trigger	INT0 low level trigger
IT0=1	INT0 failing edge trigger	INT0 rising edge trigger

6.4 Peripheral Frequency control register

Mnemonic: PFCON **Address: D9h**

7	6	5	4	3	2	1	0	Reset

7	6	5	4	3	2	1	0	Reset
T2PS[2:0]			T2R[1:0]		-	T2I[1:0]		00H

T2PS[2:0]: Prescaler select bit:

T2PS = 000 – timer 2 is clocked with the oscillator frequency.

T2PS = 001 – timer 2 is clocked with 1/2 of the oscillator frequency.

T2PS = 010 – timer 2 is clocked with 1/4 of the oscillator frequency.

T2PS = 011 – timer 2 is clocked with 1/6 of the oscillator frequency.

T2PS = 100 – timer 2 is clocked with 1/8 of the oscillator frequency.

T2PS = 101 – timer 2 is clocked with 1/12 of the oscillator frequency.

T2PS = 110 – timer 2 is clocked with 1/24 of the oscillator frequency.

T2R[1:0]: Timer 2 reload mode selection

T2R[1:0] = 0X – Reload disabled

T2R[1:0] = 10 – Mode 0: Auto Reload

T2R[1:0] = 11 – Mode 1: T2EX Falling Edge Reload

T2I[1:0]: Timer 2 input selection

T2I[1:0] = 00 – Timer 2 stop

T2I[1:0] = 01 – Input frequency from prescaler (T2PS[2:0])

T2I[1:0] = 10 – Timer 2 is incremented by external signal at pin T2

7.1 Timer 2 function

Timer 2 can operate as timer, event counter, or gated timer as explained later.

7.1.1 Timer mode

As below Fig. 7-1; In this mode Timer 2 can by incremented in various frequency that depending on the prescaler. The prescaler is selected by bit T2PS[2:0] in register T2CON.

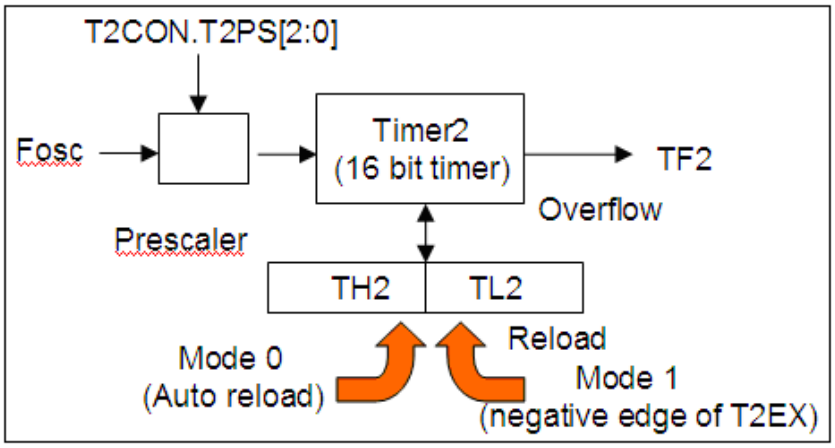

Fig. 7-1: Timer mode and Reload mode function

7.1.2 Event counter mode

As below Fig. 7-2; In this mode, the timer is incremented when external signal T2 change value from 1 to 0. The T2 input is sampled in every cycle. Timer 2 is incremented in the cycle following the one in which the transition was detected.

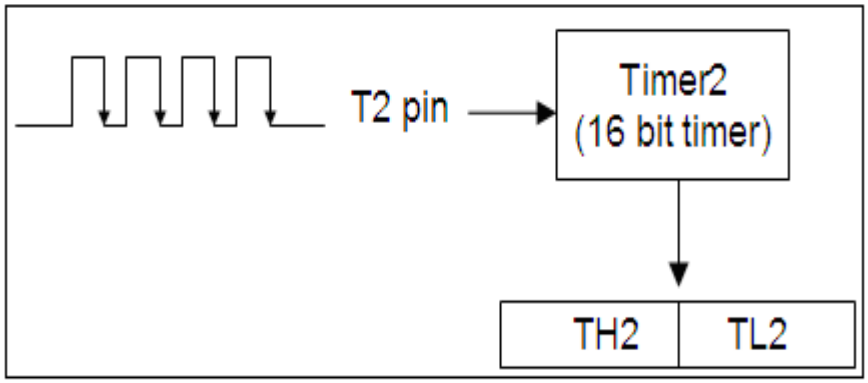

Fig. 7-2: Event counter mode function

7.1.3 Gated timer mode

As below Fig. 7-3; In this mode, the internal clock which incremented timer 2 is gated by external signal T2.

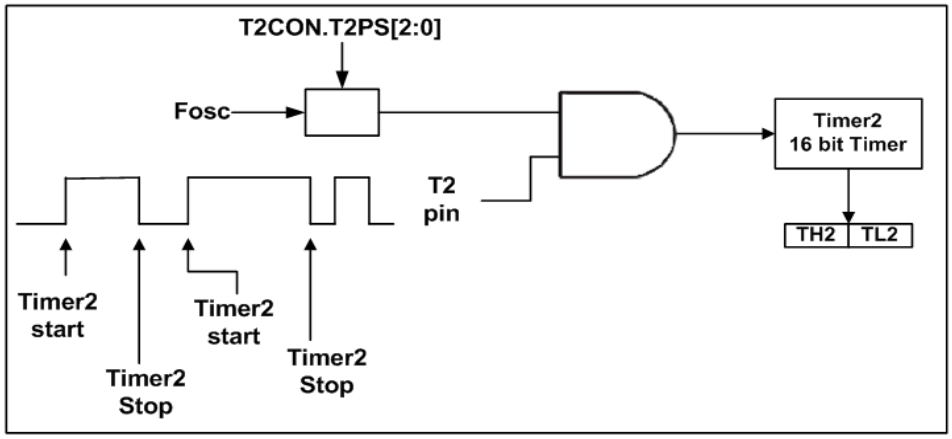

Fig. 7-3: Gated timer mode function

7.1.4 Reload of Timer 2

Reload (16-bit reload from the crc register) can be executed in the following two modes:
Mode 0: Reload signal is generate by a Timer 2 overflows - auto reload.
Mode 1: Reload signal is generate by a negative transition at the corresponding input pin T2EX.

7.2 Compare function

In the four independent comparators, the value stored in any compare/capture register is compared with the contents of the timer register. The compare modes 0 and 1 are selected by bits C0CAMx . In both compare modes, the results of comparison arrives at Port 1 within the same machine cycle in which the internal compare signal is activated.

7.2.1 Compare Mode 0

As below Fig. 7-4; In mode 0, when the value in Timer 2 equals the value of the compare register, the output signal changes from low to high. It goes back to a low level on timer overflow. In this mode, writing to the port will have no effect, because the input line from the internal bus and the write-to-latch line are disconnected. The following figure illustrates the function of compare mode 0.

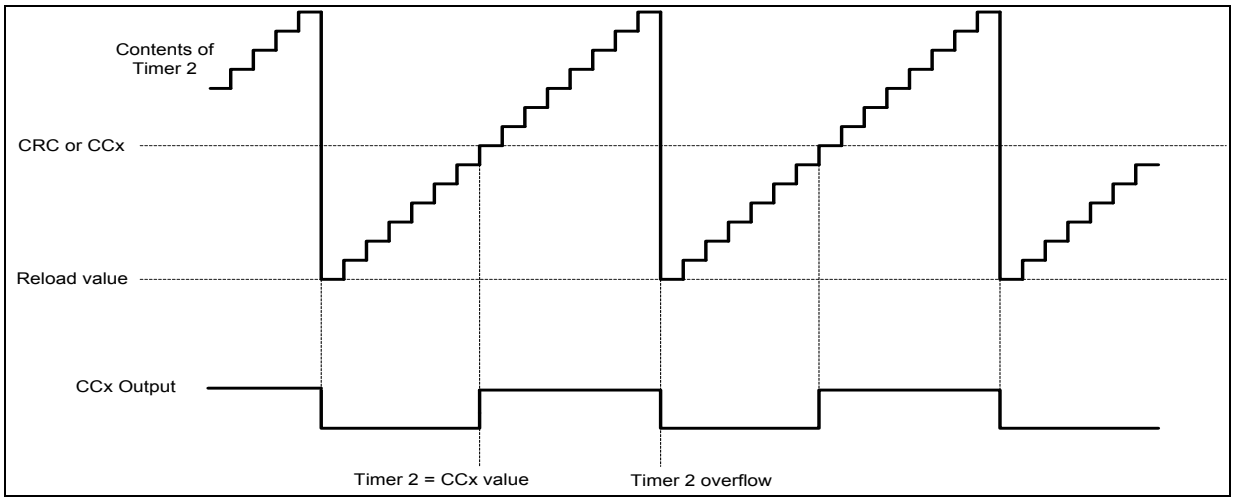

Fig. 7-4: Compare mode 0 function

7.2.2 Compare Mode 1

In compare mode 1, the transition of the output signal can be determined by software. A timer 2 overflow causes no output change. In this mode, both transitions of a signal can be controlled. Fig. 7-5 shows a functional diagram of a register/port configuration in compare Mode 1. In compare Mode 1, the value is written first to the “Shadow Register”, when compare signal is active, this value is transferred to the output register.

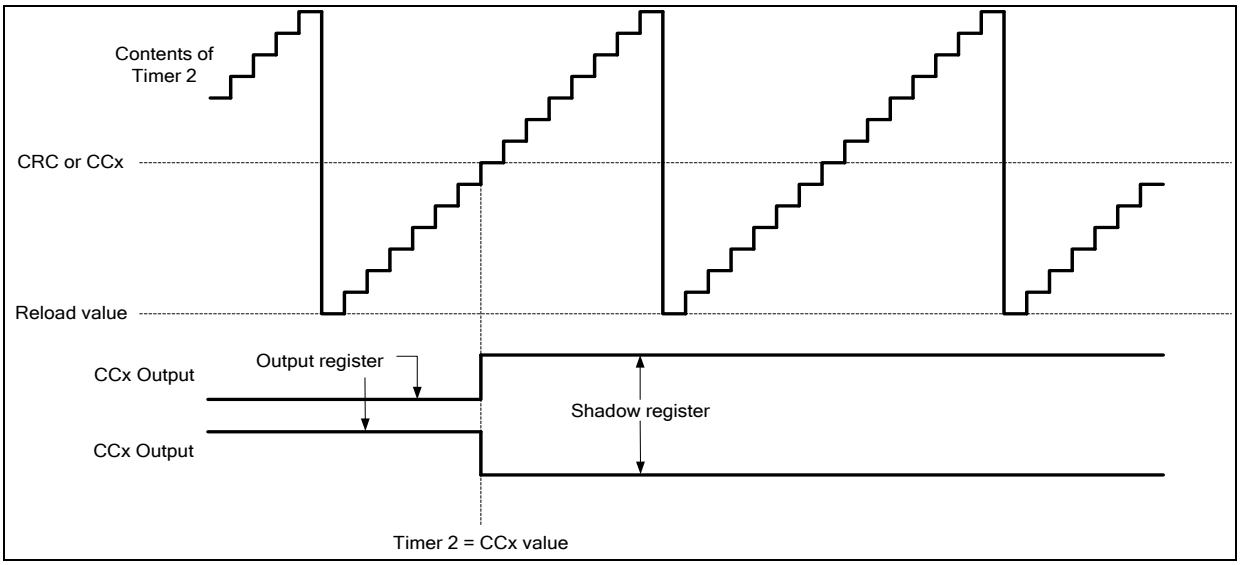

Fig. 7-5: Comparison mode 1 function

7.3 Capture function

Actual timer/counter contents can be saved into registers CCx or CRC upon an external event (mode 0) or a software write operation (mode 1).

7.3.1 Capture Mode 0 (by Hardware)

As below Fig. 7-6; In mode 0, value capture of Timer 2 is executed when:

(1) Rising edge on input CC0-CC3
(2) Falling edge on input CC0-CC3
(3) Both rising and falling edge on input CC0-CC3

The contents of Timer 2 will be latched into the appropriate capture register.

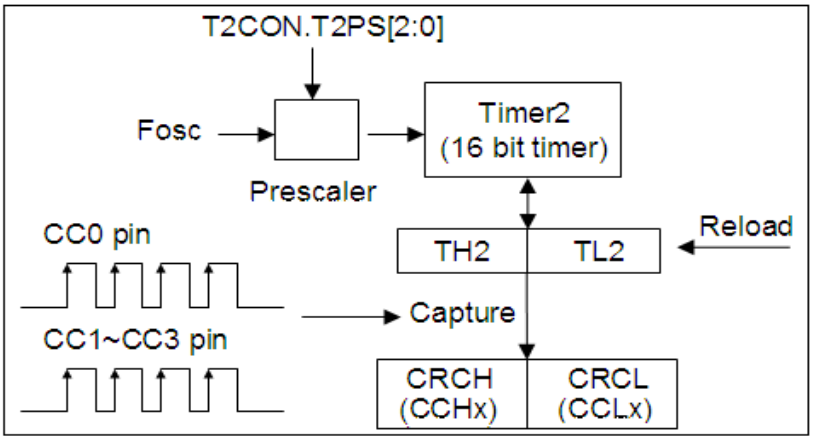

Fig. 7-6: Capture mode 0

7.3.2 Capture Mode 1(by Software)

As below Fig. 7-7; In mode 1, value capture of timer 2 is caused by writing any value into the low-order byte of the dedicated capture register. The value written to the capture register is irrelevant to this function. The contents of Timer 2 will be latched into the appropriate capture register.

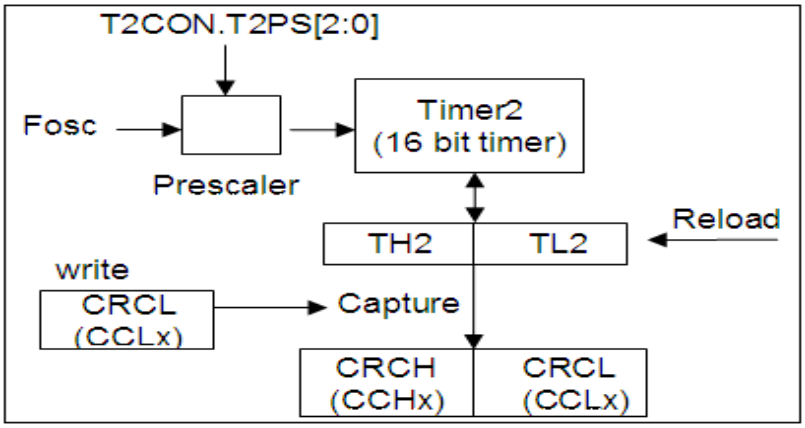

Fig. 7-7: Capture mode 1 function

8. Serial interface

The serial buffer consists of two separate registers, a transmit buffer and a receive buffer.

Writing data to the Special Function Register SBUF sets this data in serial output buffer and starts the transmission. Reading from the SBUF reads data from the serial receive buffer. The serial port can simultaneously transmit and receive data. It can also buffer 1 byte at receive, which prevents the receive data from being lost if the CPU reads the first byte before transmission of the second byte is completed.

The 4 modes in UART, Mode 0 ~ 3, are explained later.

SM2: Enables multiprocessor communication feature

REN: If set, enables serial reception. Cleared by software to disable reception.

TB8: The 9th transmitted data bit in modes 2 and 3. Set or cleared by the CPU depending on the function it performs such as parity check, multiprocessor communication etc.

RB8: In modes 2 and 3, it is the 9th data bit received. In mode 1, if SM2 is 0, RB8 is the stop bit. In mode 0, this bit is not used. Must be cleared by software.

TI: Transmit interrupt flag, set by hardware after completion of a serial transfer. Must be cleared by software.

RI: Receive interrupt flag, set by hardware after completion of a serial reception. Must be cleared by software.

8.1 Serial interface

SM0	SM1	Mode	Description	Board Rate
0	0	0	Shift register	Fosc/12
0	1	1	8-bit UART	Variable
1	0	2	9-bit UART	Fosc/32 or Fosc/64
1	1	3	9-bit UART	Variable

Here Fosc is the crystal or oscillator frequency.

8.1.1 Mode 0

As below Figure. Pin RXD serves as input and output. TXD outputs the shift clock. 8 bits are transmitted with LSB first. The baud rate is fixed at 1/12 of the crystal frequency. Reception is initialized in Mode 0 by setting the flags in SCON as follows: RI = 0 and REN = 1. In other modes, a start bit when REN = 1 starts receiving serial data.

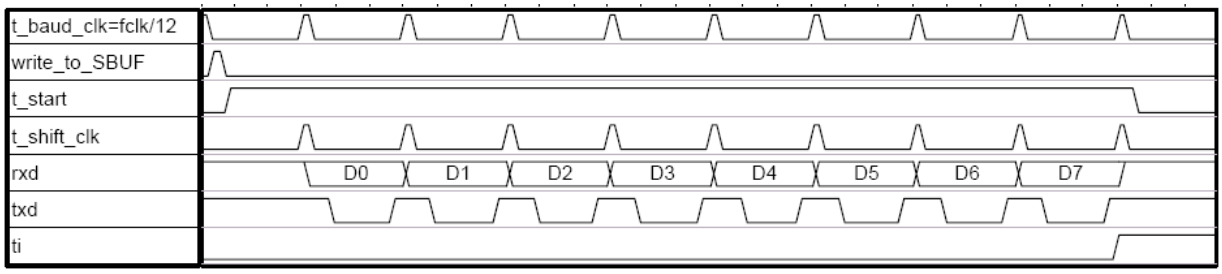

Fig. 8-1: Transmit mode 0

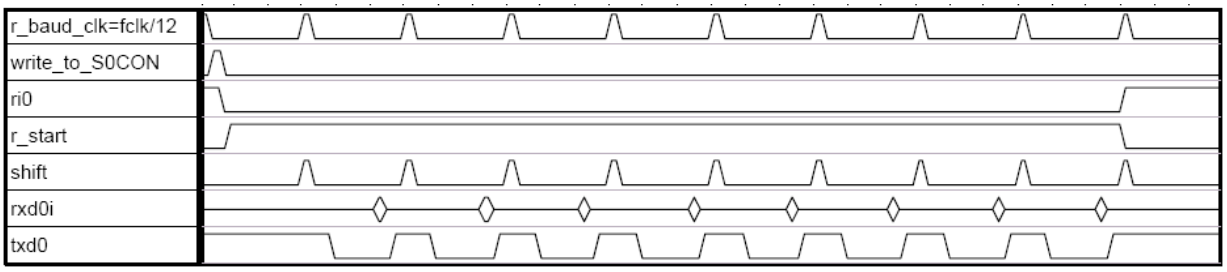

Fig. 8-2: Receive mode 0

8.1.2 Mode 1

As below Figure.Pin RXD serves as input, and TXD serves as serial output. No external shift clock is used, 10 bits are transmitted: a start bit (always 0), 8 data bits (LSB first), and a stop bit (always 1). On receive, a start bit synchronizes the transmission, 8 data bits are available by reading SBUF, and stop bit sets the flag RB8 in the Special Function Register SCON. In mode 1 either internal baud rate generator or timer 1 can be use to specify baud rate.

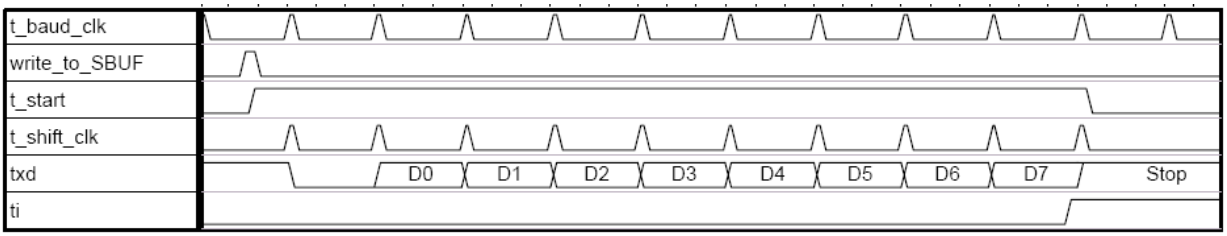

Fig. 8-3: Transmit mode 1

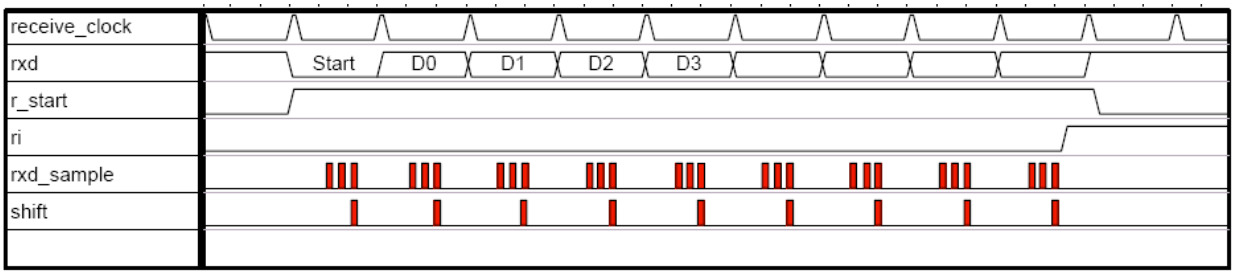

Fig. 8-4: Receive mode 0

8.1.3 Mode 2

This mode is similar to Mode 1, with two differences. The baud rate is fixed at 1/32 (SMOD=1) or 1/64(SMOD=0) of oscillator frequency and 11 bits are transmitted or received: a start bit (0), 8 data bits (LSB first), a programmable 9th bit, and a stop bit (1). The 9th bit can be used to control the parity of the serial interface: at transmission, bit TB8 in SCON is output as the 9th bit, and at receive, the 9th bit affects RB8 in Special Function Register SCON.

8.1.4 Mode 3

As below Figure. The only difference between Mode 2 and Mode 3 is that in Mode 3 either internal baud rate generator or timer 1 can be use to specify baud rate.

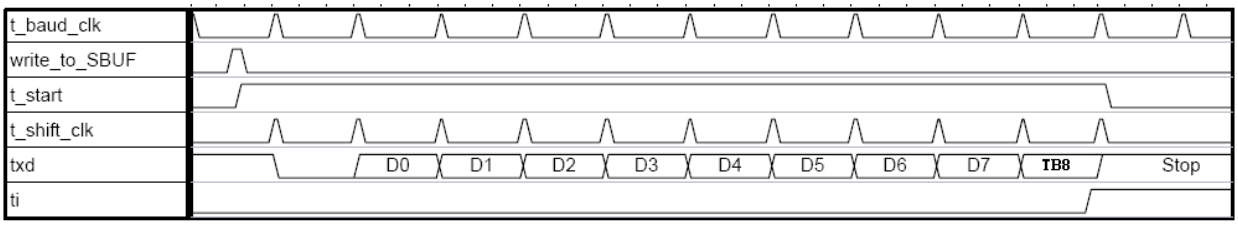

Fig. 8-5: Transfer Mode 2 and Mode 3

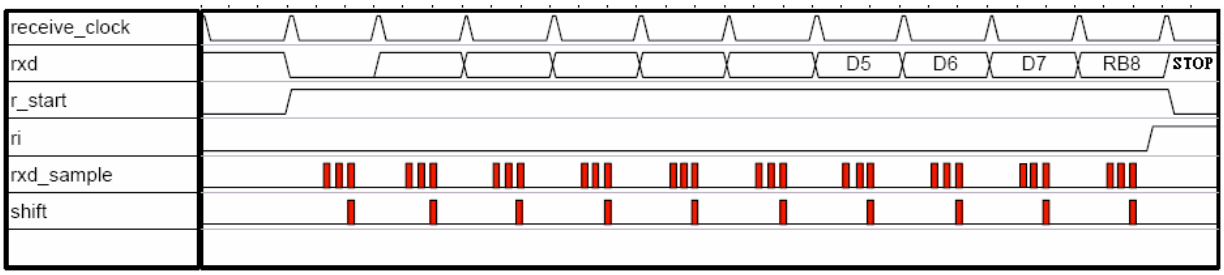

Fig. 8-6: The receiving modes 2 and 3

8.2 Multiprocessor Communication of Serial Interface

The feature of receiving 9 bits in Modes 2 and 3 of Serial Interface can be used for multiprocessor communication. In this case, the slave processors have bit SM2 in SCON set to 1. When the master processor outputs slave's address, it sets the 9th bit to 1, causing a serial port receive interrupt in all the slaves. The slave processors compare the received byte with their network address. If there is a match, the addressed slave will clear SM2 and receive the rest of the message, while other slaves will leave SM2 bit unaffected and ignore this message. After addressing the slave, the host will output the rest of the message with the 9th bit set to 0, so no serial port receive interrupt will be generated in unselected slaves.

9. Watchdog timer

The Watch Dog Timer (WDT) is an 8-bit free-running counter that generate reset signal if the counter overflows. The WDT is useful for systems which are susceptible to noise, power glitches, or electronics discharge which causing software dead loop or runaway. The WDT function can help user software recover from abnormal software condition. The WDT is different from Timer0, Timer1 and Timer2 of general 8052. To prevent a WDT reset can be done by software periodically clearing the WDT counter. User should check WDTF bit of WDTC register whenever un-predicted reset happened. After an external reset the watchdog timer is disabled and all registers are set to zeros.

The watchdog timer has a free running on-chip RC oscillator (23 KHz). The WDT will keep on running even after the system clock has been turned off (for example, in sleep mode). During normal operation or sleep mode, a WDT time-out (if enabled) will cause the MCU to reset. The WDT can be enabled or disabled any time during the normal mode. Please refer the WDTE bit of WDTC register. The default WDT time-out period is approximately 178.0ms (WDTM [3:0] = 0100b).

The WDT has selectable divider input for the time base source clock. To select the divider input, the setting of bit3 ~ bit0 (WDTM [3:0]) of Watch Dog Timer Control Register (WDTC) should be set accordingly.

$$WDTCLK = \frac{23\text{KHz}}{2^{\text{WDTM}}}$$

$$\text{Watchdog reset time} = \frac{256}{\text{WDTCLK}}$$

Table 9-1: WDT time-out period

WDTM [3:0]	Divider (23 KHz RC oscillator in)	Time period @ 23KHz
0000	1	11.1ms
0001	2	22.2ms
0010	4	44.5ms
0011	8	89.0ms
0100	16	178.0ms (default)
0101	32	356.1ms
0110	64	712.3ms
0111	128	1.4246s
1000	256	2.8493s
1001	512	5.6987s
1010	1024	11.397s
1011	2048	22.795s
1100	4096	45.590s
1101	8192	91.180s
1110	16384	182.36s
1111	32768	364.72s

Note: RC oscillator (23 KHz), about ± 20% of variation

When MCU is reset, the MCU will be read WDTEN control bit status. When WDTEN bit is set to 1, the watchdog function will be disabled no matter what the WDTE bit status is. When WDTEN bit is clear to 0, the watchdog function will be enabled if WDTE bit is set to 1 by program. User can to set WDTEN on the writer or ISP.

The program can enable the WDT function by programming 1 to the WDTE bit premise that WDTEN control bit is clear to 0. After WDTE set to 1, the 8 bit-counter starts to count with the selected time base source clock which set by WDTM [3:0]. It will generate a reset signal when overflows. The WDTE bit will be cleared to 0 automatically when MCU been reset, either hardware reset or WDT reset.

Once the watchdog is started it cannot be stopped. User can refreshed the watchdog timer to zero by writing 0x55 to Watch Dog Timer refresh Key (WDTK) register. This will clear the content of the 8-bit counter and let the counter re-start to count from the beginning. The watchdog timer must be refreshed regularly to prevent reset request signal from becoming active.

When Watchdog timer is overflow, the WDTF flag will set to one and automatically reset MCU. The WDTF flag can be clear by software or external reset or power on reset.

WDTK: Watchdog timer refresh key.

A programmer must write 0x55 into WDTK register, and then the watchdog timer will be cleared to zero.

For example 1, if enable WDT and select time-out reset period is 2.8493s.

First, programming the information block OP3 bit7 WDTEN to “0”.

Secondly,

```
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah     ; enable WDTC write attribute.
MOV WDTC, #28h      ; Set WDTM [3:0] = 1000b. Set WDTE =1 to enable WDT
                    ; function.
.
.
```

```
.
MOV WDTK, #55h      ; Clear WDT timer to 0.
.
.
```

For example 2, if enable WDT and select time-out Interrupt period is 178.0ms.

First, programming the information block OP3 bit7 WDTEN to “0”.

Secondly,

```
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah     ; enable WDTC write attribute.
MOV WDTC, #64h      ; Set WDTM [3:0] = 0100b. Set WDTE =1 to enable WDT function
                    ; and Set CWDTR =1 to enable period interrupt function
```

10. Interrupt

The SM39R08A3 provides 14 interrupt sources with four priority levels. Each source has its own request flag(s) located in a special function register. Each interrupt requested by the corresponding flag could individually be enabled or disabled by the enable bits in SFR's IEN0, IEN1, and IEN2.

When the interrupt occurs, the engine will vector to the predetermined address as shown in Table 10-1. Once interrupt service has begun, it can be interrupted only by a higher priority interrupt. The interrupt service is terminated by a return from instruction RETI. When an RETI is performed, the processor will return to the instruction that would have been next when interrupt occurred.

When the interrupt condition occurs, the processor will also indicate this by setting a flag bit. This bit is set regardless of whether the interrupt is enabled or disabled. Each interrupt flag is sampled once per machine cycle, and then samples are polled by hardware. If the sample indicates a pending interrupt when the interrupt is enabled, then interrupt request flag is set. On the next instruction cycle the interrupt will be acknowledged by hardware forcing an LCALL to appropriate vector address.

Interrupt response will require a varying amount of time depending on the state of microcontroller when the interrupt occurs. If microcontroller is performing an interrupt service with equal or greater priority, the new interrupt will not be invoked. In other cases, the response time depends on current instruction. The fastest possible response to an interrupt is 7 machine cycles. This includes one machine cycle for detecting the interrupt and six cycles for perform the LCALL.

7	6	5	4	3	2	1	0	Reset
-	-	-	-	-	CmpIF	WDTIF	-	00H

CmpIF Comparator interrupt flag
HW will clear this flag automatically when enter interrupt vector.
SW can clear this flag also.(in case analog comparator INT disable)

WDTIF: Watch dog interrupt flag

10.1 Priority level structure

All interrupt sources are combined in groups:

Table 10-2: Priority level groups

Groups		
External interrupt 0	-	PWM interrupt
Timer 0 interrupt	Watchdog interrupt	SPI interrupt
External interrupt 1	Comparator interrupt	ADC interrupt
Timer 1 interrupt	-	KBI interrupt
Serial channel interrupt	-	LVI interrupt
Timer 2 interrupt	-	IIC interrupt

Each group of interrupt sources can be programmed individually to one of four priority levels by setting or clearing one bit in the special function register ip0 and one in ip1. If requests of the same priority level will be received simultaneously, an internal polling sequence determines which request is serviced first

11. Power Management Unit

Power management unit serves two power management modes, IDLE and STOP, for the users to do power saving function.

Mnemonic: PCON **Address: 87h**

7	6	5	4	3	2	1	0	Reset
SMOD	-	-	-	-	-	STOP	IDLE	00h

STOP: Stop mode control bit. Setting this bit turning on the Stop Mode.
Stop bit is always read as 0

IDLE: Idle mode control bit. Setting this bit turning on the Idle Mode.
Idle bit is always read as 0

11.1 Idle mode

Setting the IDLE bit of PCON register invokes the IDLE mode. The IDLE mode leaves internal clocks and peripherals running. Power consumption drops because the CPU is not active. The CPU can exit the IDLE state with any interrupts or a reset.

11.2 Stop mode

Setting the STOP bit of PCON register invokes the STOP mode. All internal clocking in this mode is turn off. The CPU will exit this state from a no-clocked interrupt (external INT0/1 and LVI, KBI, Comparator interrupt, Watchdog interrupt) or a reset (WDT and LVR) condition. Internally generated interrupts (timer, serial port ...) have no effect on stop mode since they require clocking activity.

12. Pulse Width Modulation (PWM)

SM39R08A3 provides four-channel PWM outputs.
The interrupt vector is 43h.

13. IIC function

The IIC module uses the SCL (clock) and the SDA (data) line to communicate with external IIC interface. Its speed can be selected to 400Kbps (maximum) by software setting the IICBR [2:0] control bit. The IIC module provided 2 interrupts (RXIF, TXIF). It will generate START, repeated START and STOP signals automatically in master mode and can detects START, repeated START and STOP signals in slave mode. The maximum communication length and the number of devices that can be connected are limited by a maximum bus capacitance of 400pF.

The interrupt vector is 6Bh.

IICEN: Enable IIC module

IICEN = 1 is Enable

IICEN = 0 is Disable.

MSS: Master or slave mode select.

MSS = 1 is master mode.

MSS = 0 is slave mode.

*The software must set this bit before setting others register.

MAS: Master address select (master mode only)

MAS = 0 is to use IICA1.

MAS = 1 is to use IICA2.

AB_EN: Arbitration lost enable bit. (Master mode only)
If set AB_EN bit, the hardware will check arbitration lost. Once arbitration lost occurred, hardware will return to IDLE state. If this bit is cleared, hardware will not care arbitration lost condition. Set this bit when multi-master and slave connection. Clear this bit when single master to single slave.

BF_EN: Bus busy enable bit. (Master mode only)
If set BF_EN bit, hardware will not generate a start condition to bus until BF=0. Clear this bit will always generate a start condition to bus when MStart is set. Set this bit when multi-master

and slave connection. Clear this bit when single master to single slave.

IICBR[2:0]: Baud rate selection (master mode only), where Fosc is the external crystal or oscillator frequency. The default is Fosc/512 for users' convenience.

IICBR[2:0]	Baud rate
000	Fosc/32
001	Fosc/64
010	Fosc/128
011	Fosc/256
100	Fosc/512

MPIF: The Stop condition Interrupt Flag

The stop condition occurred and this bit will be set. Software need to clear this bit

LAIF: Arbitration lost bit. (Master mode only)

The Arbitration Interrupt Flag, the bus arbitration lost occurred and this bit will be set. Software need to clear this bit

RxIF: The data Receive Interrupt Flag (RXIF) is set after the IICRWD (IIC Read Write Data Buffer) is loaded with a newly receive data.

TxIF: The data Transmit Interrupt Flag (TXIF) is set when the data of the IICRWD (IIC Read Write Data Buffer) is downloaded to the shift register.

RxAK: The Acknowledge Status indicate bit. When clear, it means an acknowledge signal has been received after the complete 8 bits data transmit on the bus.

TxAK: The Acknowledge status transmit bit. When received complete 8 bits data, this bit will set (NoAck) or clear (Ack) and transmit to master to indicate the receive status.

RW or BB: **Master Mode:**

BB : Bus busy bit

If detect scl=0 or sda=0 or bus start, this bit will be set. If detect stop,this bit will be cleared. This bit can be cleared by software to return ready state.

Slave Mode:

RW:The slave mode read (received) or wrote (transmit) on the IIC bus. When this bit is clear, the slave module received data on the IIC bus (SDA).(Slave mode only)

R/W							R or R/W	

Slave mode:

IICA1[7:1]: IIC Address registers

This is the first 7-bit address for this slave module. It will be checked when an address (from master) is received

Match1: When IICA1 matches with the received address from the master side, this bit will set to 1 by hardware. When IIC bus gets first data, this bit will clear.

Master mode:

IICA1[7:1]: IIC Address registers

This 7-bit address indicates the slave with which it wants to communicate.

RW1: This bit will be sent out as RW of the slave side if the module has set the MStart or RStart bit. It appears at the 8th bit after the IIC address as shown in Fig. 13-2. It is used to tell the salve the direction of the following communication. If it is 1, the module is in master receive mode. If 0, the module is in master transmit mode.

RW1=1, master receive mode

RW1=0, master transmit mode

IICA2[7:1]							Match2 or RW2	60h
R/W							R or R/W	

Slave mode:

IICA2[7:1]: IIC Address registers

This is the second 7-bit address for this slave module.

It will be checked when an address (from master) is received

Match2: When IICA2 matches with the received address from the master side, this bit will set to 1 by hardware. When IIC bus gets first data, this bit will clear.

Master mode:

IICA2[7:1]: IIC Address registers

This 7-bit address indicates the slave with which it wants to communicate.

RW2: This bit will be sent out as RW of the slave side if the module has set the MStart or RStart bit. It is used to tell the salve the direction of the following communication. If it is 1, the module is in master receive mode. If 0, the module is in master transmit mode.

RW2=1, master receive mode

RW2=0, master transmit mode

Mnemonic: IICRWD **Address: FCh**

IICRWD[7:0]: IIC read write data buffer.

In receiving (read) mode, the received byte is stored here.

In transmitting mode, the byte to be shifted out through SDA stays here.

Mnemonic: IICEBT **Address: FDH**

7	6	5	4	3	2	1	0	Reset
FU_EN		-	-	-	-	-	-	00H

Master Mode:

00: reserved

01: IIC bus module will enable read/write data transfer on SDA and SCL.

10: IIC bus module generate a start condition on the SDA/SCL, then send out address which is stored in the IICA1/IICA2(selected by MAS control bit)

11: IIC bus module generates a stop condition on the SDA/SCL.

FU_EN[7:6] will be auto-clear by hardware, so setting FU_EN[7:6] repeatedly is necessary.

Slave mode:

01: FU_EN[7:6] should be set as 01 only. The other value is inhibited.

Notice:

1. FU_EN[7:6] should be set as 01 before read/write data transfer for bus

release; otherwise, SCL will be locked(pull low).

2. FU_EN[7:6] should be set as 01 after read/write data transfer for receiving a stop condition from bus master.
3. In transmit data mode(slave mode), the output data should be filled into IICRWD before setting FU_EN[7:6] as 01.
4. FU_EN[7:6] will be auto-clear by hardware, so setting FU_EN[7:6] repeatedly is necessary.

14. SPI Function - Serial Peripheral Interface

Serial Peripheral Interface (SPI) is a synchronous protocol that allows a master device to initiate communication with slave devices.

The interrupt vector is 4Bh.

There are 4 signals used in SPI, they are

SPI_MOSI: data output in the master mode, data input in the slave mode,
SPI_MISO: data input in the master mode, data output in the master mode,
SPI_SCK: clock output from the master, the above data are synchronous to this signal
SPI_SS: input in the slave mode.

This slave device detects this signal to judge if it is selected by the master.
In the master mode, it can select the desired slave device by any IO with value = 0. Fig. 14-1 is an example showing the relation of the 4 signals between master and slaves.

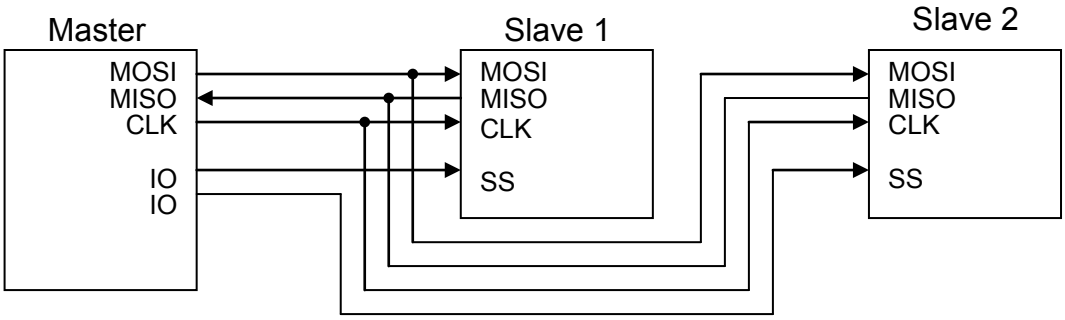

Fig. 14-1: SPI signals between master and slave devices

There is only one channel SPI interface. The SPI SFRs are shown as below:

SPIEN: Enable SPI module.

"1" is Enable.

"0" is Disable.

SPIMSS: Master or Slave mode Select

"1" is Master mode.

"0" is Slave mode.

SPISSP: SS or CS active polarity.(Slave mode used only)

"1" - high active.

"0" - low active.

SPICKP: Clock idle polarity select.

"1" - SCK will idle high. Ex :

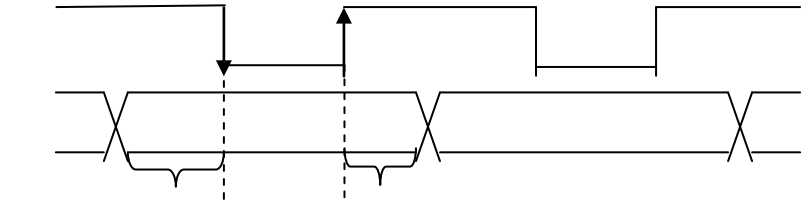
"0" - SCK will idle low. Ex :

SPICKE: Clock sample edge select.

"1" – rising edge latch data.

"0" – falling edge latch data.

* To ensure the data latch stability, SM39R08A3 generate the output data as given in the following example, the other side can latch the stable data no matter in rising or falling edge.



SPIBR[2:0]: SPI baud rate select. (Master mode used only)

SPIBR[2:0]	Baud rate
0:0:0	Fosc/4
0:0:1	Fosc /8
0:1:0	Fosc /16
0:1:1	Fosc /32
1:0:0	Fosc /64
1:0:1	Fosc /128

SPIFD	TBC[2:0]			SPIRST	RBC[2:0]			00h

SPIFD: Full-duplex mode enable.

"1" is enable full-duplex mode.

"0" is disable full-duplex mode.

When it is set, the TBC[2:0] and RBC[2:0] will be reset and keep to zero. When the Master device transmits data to the Slave device via the MOSI line, the Slave device responds by sending data to the Master device via the MISO line. This implies full-duplex transmission with both data out and data in synchronized with the same clock.

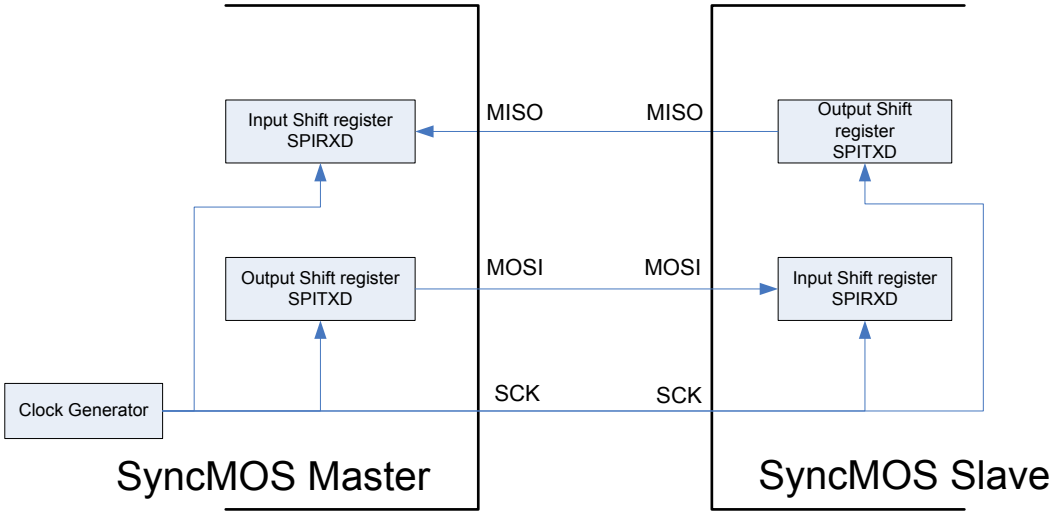

Fig. 14-2: SPI master and slave transmission method

TBC[2:0]: SPI transmitter bit counter.

TBC[2:0]	Bit counter
0:0:0	8 bits output
0:0:1	1 bit output
0:1:0	2 bits output
0:1:1	3 bits output
1:0:0	4 bits output
1:0:1	5 bits output
1:1:0	6 bits output
1:1:1	7 bits output

SPIRST: SPI Re-start (Slave mode used only)

SPIRST=0:Re-start function disable.SPI transmit/receive data when SS active.

In SPITXD/SPIRXD buffer, data got from previous SS active period will not be removed (i.e. it's valid).

SPIRST=1:Re-start function enable.SPI transmit/receive new data when SS re-active;

In SPITXD/SPIRXD buffer, data got from previous SS active period will be removed (i.e. It's invalid).

RBC[2:0]: SPI receiver bit counter.

RBC[2:0]	Bit counter
0:0:0	8 bits input
0:0:1	1 bit input
0:1:0	2 bits input

SPIRF: SPI SS pin Release Flag.

This bit is set when SS pin release & SPIRST as '1'.

SPIMLS: MSB or LSB first output /input Select.

"1" is MSB first output/input.

"0" is LSB first output/input.

SPIOV: Overflow flag.

When SPIRDR is set and next data already into shift register, this flag will be set.

It is clear by hardware, when SPIRDR is cleared.

SPITXIF: Transmit Interrupt Flag.

This bit is set when the data of the SPITXD register is downloaded to the shift register.

SPITDR: Transmit Data Ready.

When MCU finish writing data to SPITXD register, the MCU needs to set this bit to '1' to inform the SPI module to send the data. After SPI module finishes sending the data from SPITXD, this bit will be cleared automatically.

SPIRXIF: Receive Interrupt Flag.

This bit is set after the SPIRXD is loaded with a newly receive data.

SPIRDR: Receive Data Ready.

The MCU must clear this bit after it gets the data from SPIRXD register. The SPI module is able to write new data into SPIRXD only when this bit is cleared.

SPIRS: Receive Start.

This bit set to "1" to inform the SPI module to receive the data into SPIRXD register.

7	6	5	4	3	2	1	0	Reset
-	-	-	-	KBF.3	KBF.2	KBF.1	KBF.0	00h

KBF.3: Keyboard Line 3 flag

This is set by hardware when KBI3 detects a programmed level.

It generates a Keyboard interrupt request if KBE.3 is also set. It must be cleared by software.

KBF.2: Keyboard Line 2 flag

This is set by hardware when KBI2 detects a programmed level.

It generates a Keyboard interrupt request if KBE.2 is also set. It must be cleared by software.

KBF.1: Keyboard Line 1 flag

This is set by hardware when KBI1 detects a programmed level.

It generates a Keyboard interrupt request if KBE.1 is also set. It must be cleared by software.

KBF.0: Keyboard Line 0 flag

This is set by hardware when KBI0 detects a programmed level.

It generates a Keyboard interrupt request if KBE.0 is also set. It must be cleared by software.

Mnemonic: KBD **Address: 96H**

7	6	5	4	3	2	1	0	Reset
KBDEN	-	-	-	-	-	KBD.1	KBD.0	00H

KBDEN: Enable KBI de-bounce function. The default KBI function is enabled.

KBDEN = 0, enable KBI de-bounce function. The de-bounce time is selected by KBD [1:0].

KBDEN = 1, disable KBI de-bounce function. The KBI input pin without de-bounce mechanism.

KBD[1:0]: Select KBI de-bounce time. If KBDEN = “0”, the default de-bounce time is 320 ms.

KBD[1:0] = 00, the de-bounce time is 320 ms.

KBD[1:0] = 01, the de-bounce time is 160 ms.

KBD[1:0] = 10, the de-bounce time is 80 ms.

KBD[1:0] = 11, the de-bounce time is 40 ms.

16. LVI & LVR – Low Voltage Interrupt and Low Voltage Reset

18. In-System Programming (Internal ISP)

The SM39R08A3 can generate flash control signal by internal hardware circuit. Users utilize flash control register, flash address register and flash data register to perform the ISP function without removing the SM39R08A3 from the system. The SM39R08A3 provides internal flash control signals which can do flash program/chip erase/page erase/protect functions. User need to design and use any kind of interface which SM39R08A3 can input data. User then utilize ISP service program to perform the flash program/chip erase/page erase/protect functions.

18.1 ISP service program

The ISP service program is a user developed firmware program which resides in the ISP service program space. After user developed the ISP service program, user then determine the size of the ISP service program. User need to program the ISP service program in the SM39R08A3 for the ISP purpose.

The ISP service programs were developed by user so that it should includes any features which relates to the flash memory programming function as well as communication protocol between SM39R08A3 and host device which output data to the SM39R08A3. For example, if user utilize UART interface to receive/transmit data between SM39R08A3 and host device, the ISP service program should include baud rate, checksum or parity check or any error-checking mechanism to avoid data transmission error.

The ISP service program can be initiated under SM39R08A3 active or idle mode. It can not be initiated under power down mode.

18.2 Lock Bit (N)

The Lock Bit N has two functions: one is for service program size configuration and the other is to lock the ISP service program space from flash erase function.

The ISP service program space address range $3C00 to $3FFF. It can be divided as blocks of N*128 byte. (N=0 to 8). When N=0 means no ISP function, all of 8KB+1KB flash memory can be used as program memory. When N=1 means ISP service program occupies 128 byte while the rest of 8K+0.875K byte flash memory can be used as program memory. The maximum ISP service program allowed is 1K byte when N=8. Under such configuration, the usable program memory space is 8K byte.

After N determined, SM39R08A3 will reserve the ISP service program space downward from the top of the program address $3FFF. The start address of the ISP service program located at $3x00 while x is depending on the lock bit N. Please see Table 18-1. program memory diagram for this ISP service program space structure.

The lock bit N function is different from the flash protect function. The flash erase function can erase all of the flash memory except for the locked ISP service program space. If the flash not has been protected, the content of ISP service program still can be read. If the flash has been protected, the overall content of flash program memory space including ISP service program space can not be read.

Table 18-1: ISP code area.

N	ISP service program address
0	No ISP service program
1	128 bytes ($3F80h ~ $3FFFh)
2	256 bytes ($3F00h ~ $3FFFh)
3	384 bytes ($3E80h ~ $3FFFh)
4	512 bytes ($3E00h ~ $3FFFh)
5	640 K bytes ($3D80h ~ $3FFFh)
6	768 K bytes ($3D00h ~ $3FFFh)
7	896 K bytes ($3C80h ~ $3FFFh)
8	1.0 K bytes ($3C00h ~ $3FFFh)

ISP service program configurable in N*128 byte (N= 0 ~ 8)

18.3 Program the ISP Service Program

After Lock Bit N is set and ISP service program been programmed, the ISP service program memory will be protected (locked) automatically. The lock bit N has its own program/erase timing. It is different from the flash memory program/erase timing so the locked ISP service program can not be erased by flash erase function. If user needs to erase the locked ISP service program, he can do it by writer only. User can not change ISP service program when SM39R08A3 was in system.

18.4 Initiate ISP Service Program

To initiate the ISP service program is to load the program counter (PC) with start address of ISP service program and execute it. There are four ways to do so:

(1) Blank reset. Hardware reset with first flash address blank ($0000=#FFH) will load the PC with start address of ISP service program. The hardware reset includes MAX810 (power on reset) and external pad reset. The hardware will issue a strobe window about 256us after hardware reset.

(2) Execute jump instruction can load the start address of the ISP service program to PC.

(3) Enter's ISP service program by hardware setting. User can force SM39R08A3 enter ISP service program by setting P1.6 " active low" during hardware reset period. The hardware reset includes MAX810 (power on reset) and external pad reset. The hardware will issue after hardware reset. In application system design, user should take care of the setting of P1.6 at reset period to prevent SM39R08A3 from entering ISP service program.

(4) Enter's ISP service program by hardware setting, the P1.1(RXD) will be detected the two clock signals during hardware reset period. The hardware reset includes MAX810 (power on reset) and external pad reset. The hardware will issue to detect 2 clock signals after hardware reset.

During the strobe window, the hardware will detect the status of P1.6/P1.1. If they meet one of above conditions, chip will switch to ISP mode automatically. After ISP service program executed, user need to reset the SM39R08A3, either by hardware reset or by WDT, or jump to the address $0000 to re-start the firmware program.

There are 8 kinds of entry mechanisms for user different applications. This entry method will select on the writer or ISP.

(1) First Address Blank. i.e. $0000 = 0xFF. And triggered by Internal reset signal.
(2) First Address Blank. i.e. $0000 = 0xFF. And triggered by PAD reset signal.
(3) P1.6 = 0. And triggered by Internal reset signal.
(4) P1.6 = 0. And triggered by PAD reset signal.
(5) P1.1 input 2 clocks. And triggered by Internal reset signal.
(6) P1.1 input 2 clocks. And triggered by PAD reset signal.

18.5 ISP register – TAKEY, IFCON, ISPFAH, ISPFAL, ISPFD and ISPFC

Mnemonic	Description	Dir.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	RST
ISP function											
TAKEY	Time Access Key register	F7h	TAKEY [7:0]								00H
IFCON	Interface Control register	8Fh	-	CDPR	-	-	-	-	-	ISPE	00H
ISPFAH	ISP Flash Address – High register	E1h	-	-	ISPFAH [5:0]						FFH
ISPFAL	ISP Flash Address – Low register	E2h	ISPFAL [7:0]								FFH
ISPFD	ISP Flash Data register	E3h	ISPFD [7:0]								FFH
ISPFC	ISP Flash Control register	E4h	EMF1	-	EMF3	EMF4	-	ISPF.2	ISPF.1	ISPF.0	00H

Mnemonic: TAKEY **Address: F7H**

7	6	5	4	3	2	1	0	Reset
TAKEY [7:0]								00H

ISP enable bit (ISPE) is read-only by default, software must write three specific values 55h, AAh and 5Ah sequentially to the TAKEY register to enable the ISPE bit write attribute. That is:

```
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah
```

Mnemonic: IFCON **Address: 8FH**

7	6	5	4	3	2	1	0	Reset
-	CDPR	-	-	-	-	-	ISPE	00H

The bit 0 (ISPE) of IFCON is ISP enable bit. User can enable overall SM39R08A3 ISP function by setting ISPE bit to 1, to disable overall ISP function by set ISPE to 0. The function of ISPE behaves like a security key. User can disable overall ISP function to prevent software program be erased accidentally. ISP registers ISPFAH, ISPFAL, ISPFD and ISPFC are read-only by default. Software must be set ISPE bit to 1 to enable these 4 registers write attribute.

Mnemonic: ISPFAH **Address: E1H**

7	6	5	4	3	2	1	0	Reset
-	-	ISPFAH5	ISPFAH4	ISPFAH3	ISPFAH2	ISPFAH1	ISPFAH0	FFH

ISPFAH [5:0]: Flash address-high for ISP function

Mnemonic: ISPFAL **Address: E2H**

7	6	5	4	3	2	1	0	Reset
ISPFAL7	ISPFAL6	ISPFAL5	ISPFAL4	ISPFAL3	ISPFAL2	ISPFAL1	ISPFAL0	FFH

ISPFAL [7:0]: Flash address-Low for ISP function

The ISPFAH & ISPFAL provide the 14-bit flash memory address for ISP function. The flash memory address should not include the ISP service program space address. If the flash memory address indicated by ISPFAH & ISPFAL registers overlay with the ISP service program space address, the flash program/page erase of ISP function executed thereafter will have no effect.

Mnemonic: ISPFD **Address: E3H**

7	6	5	4	3	2	1	0	Reset
ISPFD7	ISPFD6	ISPFD5	ISPFD4	ISPFD3	ISPFD2	ISPFD1	ISPFD0	FFH

ISPFD [7:0]: Flash data for ISP function.

The ISPFD provide the 8-bit data register for ISP function.

Mnemonic: ISPFC **Address: E4H**

7	6	5	4	3	2	1	0	Reset
EMF1	-	EMF3	EMF4	-	ISPF[2]	ISPF[1]	ISPF[0]	00H

EMF1: Entry mechanism (1) flag, clear by reset. (Read only)

EMF3: Entry mechanism (3) flag, clear by reset. (Read only)

EMF4: Entry mechanism (4) flag, clear by reset. (Read only)

ISPF [2:0]: ISP function select bit.

ISPF[2:0]	ISP function
000	Byte program
001	Chip protect
010	Page erase
011	Chip erase
100	Write option
101	Read option
110	Erase option
111	reserved

One page of flash memory is 128byte

The Option function can access the XTAL1 and XTAL2 swap to I/O pins select(description in section 1.2), Internal reset time select(description in section 1.4.1), clock source select(description in section 1.5), Reset swap to I/O pins function select(description in section 5), WDTEN control bit(description in section 9), or ISP entry mechanisms select(description in section 18).

When chip protected or no ISP service, option can only read.

The choice ISP function will start to execute once the software write data to ISPFC register.

To perform byte program/page erases ISP function, user need to specify flash address at first. When performing page erase function, SM39R08A3 will erase entire page which flash address indicated by ISPFAH & ISPFAL registers located within the page.

e.g. flash address: $ XYMN

page erase function will erase from $XY00 to $XYFF

To perform the chip erase ISP function, SM39R08A3 will erase all the flash program memory except the ISP service program space. To perform chip protect ISP function, the SM39R08A3 flash memory content will be read #00H.

e.g. ISP service program to do the byte program - to program #22H to the address $1005H

```
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah    ; enable ISPE write attribute
ORL IFCON, #01H    ; enable SM39R08A3 ISP function
MOV ISPFAH, #10H   ; set flash address-high, 10H
MOV ISPFAL, #05H   ; set flash address-low, 05H
MOV ISPFD, #22H    ; set flash data to be programmed, data = 22H
MOV ISPFC, #00H    ; start to program #22H to the flash address $1005H
MOV TAKEY, #55h
MOV TAKEY, #0AAh
MOV TAKEY, #5Ah    ; enable ISPE write attribute
ANL IFCON, #0FEH   ; disable SM39R08A3 ISP function
```

19. Comparator

SM39R08A3 had integrated two Comparator module on chip. This module supports Comparator modes individually according to user's configuration. When Comparator Mode enabled, an internal reference voltage is available to be configured on comparator terminals.

Comparator SFRs as follows:
