- NOTE:**
- The type numbers shown have a 5% tolerance on nominal zener voltage. No suffix signifies a 10% tolerance, C signifies 2%, and D signifies 1% tolerance.
 - The Zener impedance is derived from the 60 Hz ac voltage, which results when an ac current having an rms value equal to 10% of the dc Zener current (I_{ZT} or I_{ZK}) is superimposed on I_{ZT}. Zener impedance is measured at two points to insure a sharp knee on the breakdown curve and eliminate unstable units.
 - The reverse surge current is measured at 25 °C ambient using a square wave or equivalent sine wave pulse 1/120 second duration superimposed on I_{ZT}.
 - Voltage at thermal equilibrium or 90 seconds after application of dc current.
