Fig. 1 Test circuit for $V_{KA}=V_{ref}$

Fig. 2 Test circuit for $V_{KA}>V_{ref}$

Fig. 3 Test circuit for $I_{K(off)}$

$$V_{KA} = V_{ref} \times \left(1 + \frac{R_1}{R_2}\right) + I_{ref} \times R_1$$

Note.

1. Ambient temperature range: $T_{LOW} = -40^{\circ}C$, $T_{High} = 85^{\circ}C$
2. The deviation parameters ΔV_{ref} and ΔI_{ref} are defined as the difference between the maximum value and minimum value obtained over the full operating ambient temperature range that applied.

The average temperature coefficient of the reference input voltage, αV_{ref} is defined as:

$$\alpha V_{ref} \left(\frac{\text{ppm}}{^{\circ}C}\right) = \frac{\left(\frac{\Delta V_{ref}}{V_{ref}(T_a = 25^{\circ}C)} \times 10^6\right)}{\Delta T_a}$$

Example : $\Delta V_{ref} = 30\text{mV}$ and the slope is positive,

$$\Delta V_{ref} @ 25^{\circ}C = 2.495\text{V}$$

$$\Delta T_a = 70^{\circ}C$$

$$\alpha V_{ref} \left(\frac{\text{ppm}}{^{\circ}C}\right) = \frac{\left(\frac{0.03}{2.495}\right) \times 10^6}{70} = 171\text{ppm}/^{\circ}C$$

3. The dynamic impedance Z_{KA} is defined as:

$$|Z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_K}$$

When the device is operating with two external resistors, R1 and R2, (refer to Fig.2) the total dynamic impedance of the circuit is given by:

$$|Z_{KA}'| = |Z_{KA}| \times \left(1 + \frac{R_1}{R_2}\right)$$
