

GENERAL DESCRIPTION

SN57 is a high performance offline PSR power switch for low power AC/DC charger and adapter applications. It operates in primary-side sensing and regulation. Consequently, opto-coupler and TL431 could be eliminated. Proprietary Constant Voltage (CV) and Constant Current (CC) control is integrated as shown in the figure below.

In CC control, the current and output power setting can be adjusted externally by the sense resistor R_s at CS pin. In CV control, multi-mode operations are utilized to achieve high performance and high efficiency. In addition, good load regulation is achieved by the built-in cable drop compensation. Device operates in PFM in CC mode as well at large load condition and it operates in PWM with frequency reduction at light/medium load. The chip consumes very low operation current, it can achieve less than 75mW standby power.

SN57 offers comprehensive protection coverage with auto-recovery features including Cycle-by-Cycle current limiting, VDD over voltage protection, short circuit protection, built-in leading edge blanking, VDD under voltage lockout (UVLO), OTP etc.

SN57 is offered in SOP8 package.

Figure.1. Typical CC/CV Curve

FEATURES

- Primary-side sensing and regulation without TL431 and opto-coupler
- High precision constant voltage and current regulation at universal AC input
- Multi-mode PWM/PFM operation for efficiency improving
- Quasi-resonant operation for highest overall efficiency
- Programmable CV and CC regulation
- Built-in line voltage and primary winding inductance compensation
- Programmable cable drop compensation
- No need for control loop compensation
- Audio noise free operation
- Internal BJT switch
- Good dynamic response with synchronous rectifier application
- Built-in leading edge blanking (LEB)
- Comprehensive protection coverage with auto-recovery
 - VDD over voltage protection
 - VDD under voltage lockout with hysteresis (UVLO)
 - Cycle-by-cycle current limiting
 - Feedback loop open protection
 - Output short circuit protection
 - Over temperature protection (OTP)

APPLICATIONS

Low Power AC/DC offline SMPS for

- Cell Phone Charger
- Digital Cameras Charger
- Small Power Adapter
- Auxiliary Power for PC, TV etc.
- Linear Regulator/RCC Replacement

TYPICAL APPLICATION

GENERAL INFORMATION

Ordering Information

Part Number	Description
SN57CP	SOP8, Halogen-free, Tube
SN57CPA	SOP8, Halogen-free, T&R

Package Dissipation Rating

Package	R _{θJA} (°C/W)
SOP8	85

Recommended Operating Condition

Symbol	Parameter	Range
VDD	VDD Supply Voltage	5 to 16V

Absolute Maximum Ratings

Parameter	Value
CB Voltage	750V
VDD Voltage	-0.3 to 20V
FB Input Voltage	-0.3 to 7V
CS Input Voltage	-0.3 to 7V
Min/Max Operating Junction Temperature T _J	-40 to 150 °C
Operating Ambient Temperature T _A	-20 to 85 °C
Min/Max Storage Temperature T _{stg}	-55 to 150 °C
Lead Temperature (Soldering, 10secs)	260 °C

Note: Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.

Recommended Output power Table

Product	Adapter ^{Note1}
SN57CP	90V~264V
	12W

Notes: 1. Maximum practical continuous power in an adapter design with sufficient drain pattern as a heat sink, at 40°C ambient

CHARACTERIZATION PLOTS

OPERATION DESCRIPTION

SN57 is a cost effective PSR power switch optimized for off-line low power AC/DC applications including battery chargers. It operates in primary side sensing and regulation, thus opto-coupler and TL431 are not required. Proprietary built-in CV and CC control can achieve high precision CC/CV control meeting most charger application requirements.

Startup Current and Startup Control

Startup current of SN57 is designed to be very low so that VDD can be charged up quickly. A large value startup resistor can therefore be used to minimize the power loss in application.

Operating Current

The operating current of SN57 is as low as 550uA (typical). Good efficiency and low standby power is achieved with the low operating current.

CC/CV Operation

SN57 is designed to produce good CC/CV control characteristic as shown in the Figure. 1.

In charger applications, a discharged battery charging starts in the CC portion of the curve until it is nearly full charged and smoothly switches to operate in CV portion of the curve. The CC portion provides output current limiting. In CV operation, the output voltage is regulated through the primary side control. In CC operation mode, SN57 will regulate the output current constant regardless of the output voltage drop.

Principle of Operation

To support SN57 proprietary CC/CV control, system needs to be designed in DCM mode for flyback system (Refer to Typical Application Diagram on page1).

In the DCM flyback converter, the output voltage can be sensed via the auxiliary winding. During BJT turn-on time, the load current is supplied from the output filter capacitor, Co. The current in the primary winding ramps up. When BJT turns off, the energy stored in the primary winding is transferred to the secondary side such that the current in the secondary winding is

$$I_s = \frac{N_p}{N_s} \cdot I_p \quad (1)$$

The auxiliary voltage reflects the output voltage as shown in Figure.2 and it is given by

$$V_{AUX} = \frac{N_{AUX}}{N_s} \cdot (V_o + \Delta V) \quad (2)$$

Where ΔV indicates the drop voltage of the output Diode.

Figure 2 Auxiliary voltage waveform

Via a resistor divider connected between the auxiliary winding and FB, the auxiliary voltage is sampled and hold during the demagnetization cycle. The sampling instance is variable according to the demagnetization width. The output voltage can be monitored when the secondary current is small. Thus ΔV can be ignored. The sampled voltage is compared with reference voltage V_{ref_EA} and the difference is amplified by the error amplifier. The error amplifier output reflects the load condition and controls the switching off time to regulate the output voltage, thus constant output voltage can be achieved.

When the sampled voltage is below V_{ref_EA} and the error amplifier output reaches its maximum, the switching frequency is controlled by the sampled voltage to regulate the output current, thus the constant output current can be achieved.

Adjustable CC Point and Output Power

In SN57, the CC point and maximum output power can be externally adjusted by external current sense resistor R_s at CS pin as illustrated in typical application diagram. The larger R_s , the smaller CC point is, and the smaller output power becomes, and vice versa as shown in Figure.3.

Figure 3. Adjustable output power by changing R_s

On Time OCP Compensation

The variation of max output current in CC mode can be rather large if no compensation is provided. The OCP threshold value is self adjusted higher at higher AC voltage. This OCP threshold slope adjustment helps to compensate the increased output current limit at higher AC voltage. In SN57, a proprietary OCP compensation block is

integrated and no external components are needed. The OCP threshold in SN57 is a function of the switching ON time. For the ON time less than 4.0us (typical), the OCP threshold changes linearly from 500mV (typical) to 555mV (typical). For the ON time larger than 4.0us (typical), the OCP threshold is clamped to 555mV (typical), as shown in Figure 4.

Figure.4. On time OCP compensation

Operation Switching Frequency

The switching frequency of SN57 is adaptively controlled according to the load conditions and the operation modes.

For flyback operating in DCM, The maximum output power is given by

$$Po_{MAX} = \frac{1}{2} L_p F_{SW} I_p^2 \quad (3)$$

Where L_p indicate the inductance of primary winding and I_p is the peak current of primary winding.

Refer to the equation 3, the change of the primary winding inductance results in the change of the maximum output power and the constant output current in CC mode. To compensate the change from variations of primary winding inductance, the switching frequency is locked by an internal loop such that the switching frequency is

$$F_{SW} = \frac{1}{2T_{Demag}} \quad (4)$$

Since T_{Demag} is inversely proportional to the switching frequency, as a result, the product L_p and f_{sw} is constant, thus the maximum output power and constant current in CC mode will not change as primary winding inductance changes. Up to $\pm 7\%$ variation of the primary winding inductance can be compensated.

Programmable Cable Drop Compensation

In SN57, cable drop compensation is implemented to achieve good load regulation. An offset voltage is generated at FB pin by an internal current flowing into the resistor divider. The current is proportional to the switching off time, as a result, it is inversely proportional to the output load current,

thus the drop due to the cable loss can be compensated. As the load current decreases from full-load to no-load, the offset voltage at FB will increase. It can also be programmed by adjusting the resistance of the divider to compensate the drop for various cable lines used.

The percentage of maximum compensation is

$$\frac{\Delta V}{V_{out}} = \frac{I_{comp_cable} \times R_1 // R_2 \times 10^{-6}}{2.5} \times 100\%$$

ΔV is load compensation voltage and V_{out} is output voltage;

For example: $R_1 // R_2 = 5.1K\Omega$, the percentage of maximum compensation is

$$\frac{\Delta V}{V_{out}} = \frac{53 \times 5100 \times 10^{-6}}{2.5} \times 100\% = 10.8\%$$

Current Sensing and Leading Edge Blanking

Cycle-by-Cycle current limiting is offered in SN57. The switch current is detected by a sense resistor into the CS pin. An internal leading edge blanking circuit chops off the sensed voltage spike at initial power BJT on state so that the external RC filtering on sense input is no longer needed.

Protection Control

Good power supply system reliability is achieved with its rich protection features including Cycle-by-Cycle current limiting (OCP), Output over voltage protection, VDD over voltage protection, short circuit protection, Under Voltage Lockout on VDD (UVLO) and over temperature protection (OTP).

VDD is supplied by transformer auxiliary winding output. The output of SN57 is shut down when VDD drops below UVLO (ON) and the power converter enters power on start-up sequence thereafter.

To prevent the circuit being damaged under abnormal conditions, SN57 provides over thermal protection function. When the die temperature rises above over temperature threshold T_{otp} , the SN57 will shut down the base output and then latch the power supply off. The controller will remain latched until the die temperature drops below the recovery threshold T_{otp_rec} and the SN57 will reset at the same time.
