

SN75151, SN75153 QUAD DIFFERENTIAL LINE DRIVERS WITH 3-STATE OUTPUTS

SLLS082A - D2453, DECEMBER 1978 - REVISED FEBRUARY 1993

- Meets EIA Standard RS-422-A
- High-Impedance Output State for Party-Line Operation
- High Output Impedance in Power-Off Condition
- Low Input Current to Minimize Loading
- Single 5-V Supply
- 40-mA Sink- and Source-Current Capability
- High-Speed Schottky Circuitry
- Low Power Requirements

description

These line drivers are designed to provide differential signals with high current capability on balanced lines. These circuits provide strobe and enable inputs to control all four drivers, and the SN75151 provides an additional enable input for each driver. The output circuits have active pullup and pulldown and are capable of sinking or sourcing 40 mA.

The SN75151 and SN75153 meet all requirements of EIA Standard RS-422-A and Federal Standard 1020. They are characterized for operation from 0°C to 70°C.

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

‡ All typical values are at $T_A = 25^\circ\text{C}$ and $V_{CC} = 5 \text{ V}$ except for V_{OC} , for which V_{CC} is as stated under test conditions.

§ $\Delta|V_{OD}|$ and $\Delta|V_{OC}|$ are the changes in magnitudes of V_{OD} and V_{OC} , respectively, that occur when the input is changed from a high level to a low level.

¶ In EIA Standard RS-422-A, V_{OC} , which is the average of the two output voltages with respect to ground, is called output offset voltage, V_{OS} .

Only one output should be shorted at a time, and duration of the short-circuit should not exceed one second.
