

Product Description

Sirenza Microdevices' SPA-2318 is a high efficiency GaAs Heterojunction Bipolar Transistor (HBT) amplifier housed in a low-cost surface-mountable plastic package. These HBT amplifiers are fabricated using molecular beam epitaxial growth technology which produces reliable and consistent performance from wafer to wafer and lot to lot.

This product is specifically designed for use as a driver amplifier for infrastructure equipment in the 1960 and 2140 MHz bands. Its high linearity makes it an ideal choice for multi-carrier and digital applications.

The matte tin finish on Sirenza's lead-free package utilizes a post annealing process to mitigate tin whisker formation and is RoHS compliant per EU Directive 2002/95. This package is also manufactured with green molding compounds that contain no antimony trioxide nor halogenated fire retardants.

SPA-2318

SPA-2318Z RoHS Compliant & Green Package

1700-2200 MHz 1 Watt Power Amp with Active Bias

Product Features

- Now available in Lead Free, RoHS Compliant, & Green Packaging
- High Linearity Performance:
 - +21 dBm IS-95 Channel Pwr at -55 dBc ACP
 - +20.7 dBm W-CDMA Channel Pwr at -50dBc ACP
 - +47 dBm Typ. OIP3
- On-chip Active Bias Control
- High Gain: 24 dB Typ. at 1960 MHz
- Patented High Reliability GaAsHBT Technology
- Surface-Mountable Plastic Package

Applications

- W-CDMA Systems
- PCS Systems
- Multi-Carrier Applications

Pin #	Function	Description
1	VC1	VC1 is the supply voltage for the first stage transistor. The configuration as shown on application schematic is required for optimum RF performance.
2	Vbias	Vbias is the bias control pin for the active bias network. Recommended configuration is shown in the Application Schematic.
3	RF In	RF input pin. This pin requires the use of an external DC blocking capacitor as shown in the Application Schematic.
4	VPC2	VPC2 is the bias control pin for the active bias network for the second stage. The recommended configuration is shown in the Application Schematic.
5, 6, 7, 8	RF Out/VC2	RF output and bias pins. Bias should be supplied to this pin through an external RF choke. Because DC biasing is present on this pin, a DC blocking capacitor should be used in most applications (see application schematic). The supply side of the bias network should be well bypassed. An output matching network is necessary for optimum performance.
EPAD	Gnd	Exposed area on the bottom side of the package needs to be soldered to the ground plane of the board for thermal and RF performance. Several vias should be located under the EPAD as shown in the recommended land pattern (page 9).

Simplified Device Schematic

Absolute Maximum Ratings

Parameter (Ta = 25°C)	Absolute Limit
Max. Supply Current (I _{cc1}) at V _{cc} typ.	150 mA
Max. Supply Current (I _{cc2}) at V _{cc} typ.	750 mA
Max. Device Voltage (V _{cc}) at I _{cc} typ.	6.0 V
Max. RF Input Power	16 dBm
Max. Junction Temp. (T _J)	+160 °C
Max. Storage Temp.	+150 °C

Operation of this device beyond any one of these limits may cause permanent damage. For reliable continuous operation, the device voltage and current must not exceed the maximum operating values specified in the table on page one.

Bias Conditions should also satisfy the following expression:

$$I_{cc} V_{cc} (\max) < (T_J - T_J) / R_{\theta j-c}$$

Caution: ESD sensitive

Appropriate precautions in handling, packaging and testing devices must be observed.

The Moisture Sensitivity Level rating for this device is level 1 (MSL-1) based on the JEDEC 22-A113 standard classification. No special moisture packaging/handling is required during storage, shipment, or installation of the devices.
