528-CHANNEL DRIVER WITH SYSTEM-ON-CHIP (SOC) FOR COLOR AMORPHOUS TFT LCD

1. GENERAL DESCRIPTION

The SPFD54126B, a 262144-color System-on-Chip (SoC) driver LSI designed for small and medium sizes of TFT LCD display, is capable of supporting up to 176xRGBx220 in resolution which can be achieved by the designated RAM for graphic data. The 528-channel source driver has true 6-bit resolution, which generates 64 Gamma-corrected values by an internal D/A converter. The source driver of SPFD54126B adopts OP-AMP structure to enhance display quality and it cooperates with advanced circuitry techniques to reduce power consumption.

The SPFD54126B is able to operate with low IO interface power supply up to 1.6V and incorporate with several charge pumps to generate various voltage levels that form an on-chip power management system for gate driver and common driver.

The built-in timing controller in SPFD54126B can support several interfaces for the diverse request of medium or small size portable display. SPFD54126B provides system interfaces, which include 8-/9-/16-/18-bit parallel interfaces and 9-bit serial interface (SPI), to configure system. Not only can the system interfaces be used to configure system, they can also access RAM at high speed for still picture display. In addition, the SPFD54126B incorporates 6, 16, and 18-bit RGB interfaces for picture movement display. The SPFD54126B also supports a function to display eight colors and a standby mode for power control consideration.

2. FEATURE

- One-chip solution for amorphous TFT-LCD.
- Supports resolution up to 176xRGBx220, incorporating a 528-channel source driver and a 220-channel gate driver
- Outputs 64 γ -corrected values using an internal true 6-bit resolution D/A converter to achieve 262K colors
- 528-channel source driver adopts OP-AMP structure
- Built-in 87120 bytes internal RAM
- Line Inversion AC drive / frame inversion AC drive

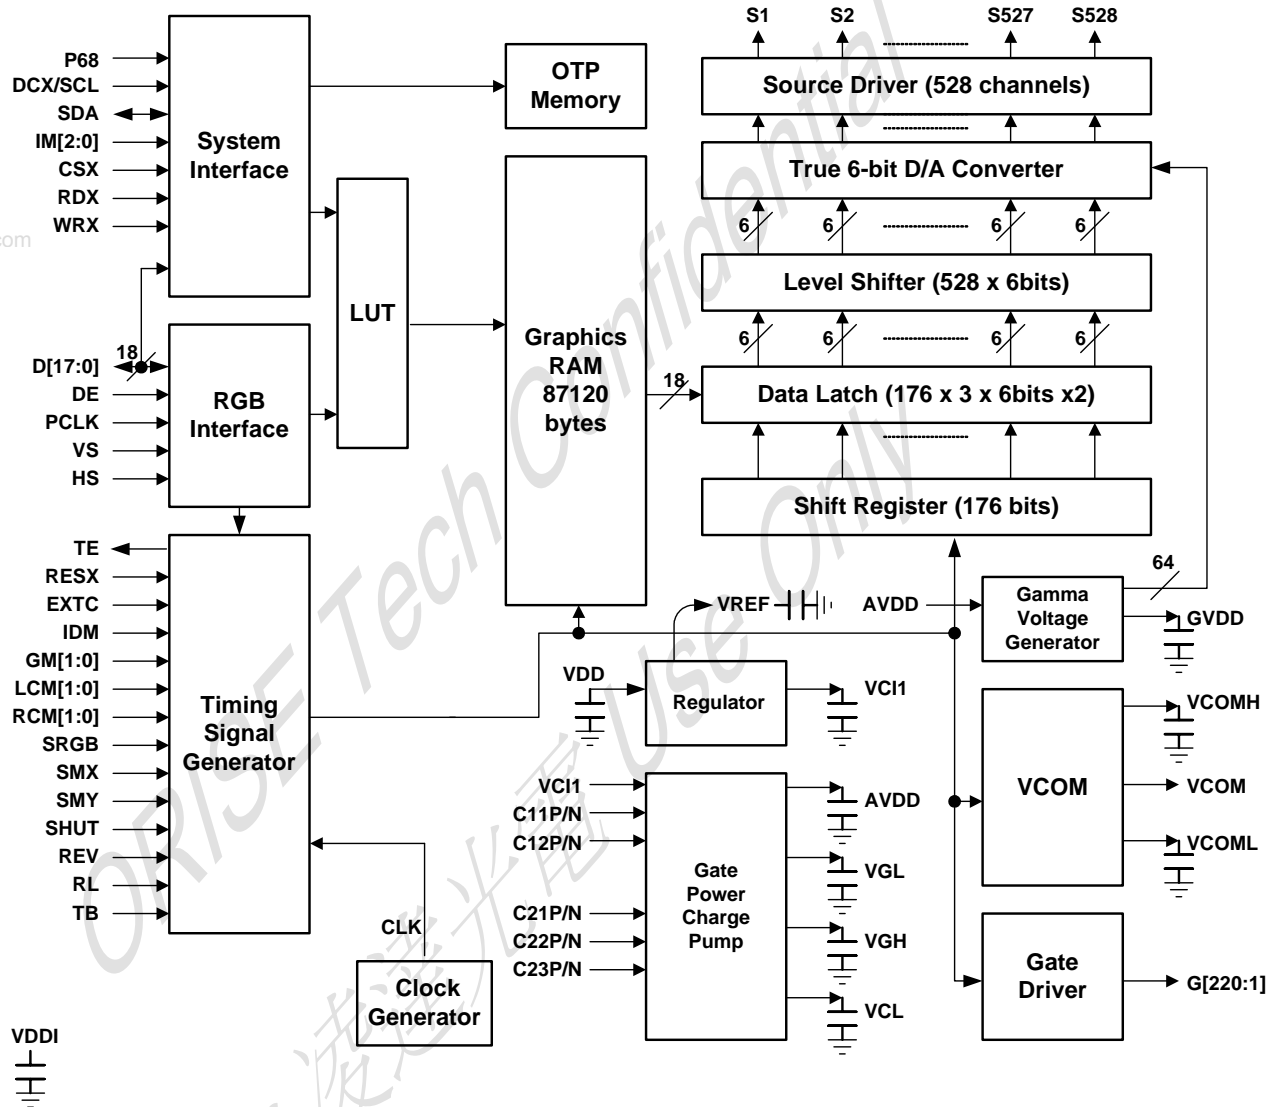

- System interfaces
 - High-speed interfaces to 8-, 9-, 16-, and 18-bit parallel ports
 - Serial Peripheral Interface (SPI)
- Interfaces for moving picture display
 - 6-, 16-, and 18-bit RGB interfaces
- Diverse RAM accessing for functional display
 - Window address function to display at any area on the screen via a moving picture display interface
 - Window address function to limit the data rewriting area and reduce data transfer
 - Moving and still picture can display at the same time
 - Vertical scrolling function
 - Partial screen display
- Power supply
 - Logic power supply voltage (VDD): 2.6 ~ 3.5 V
 - I/O interface supply voltage (VDDI): 1.6 ~ 3.6 V
- On-chip power management system
 - Power saving mode (standby / 8-color mode, etc)
 - Low power consumption OP-AMP structure for source driver.
- Built-in Charge Pump circuits
 - Source driver voltage level : 2 times (x2) of Vci1
 - Gate driver voltage level (VGH, VGL) up to 6 times (x6) and minus 5 times (x-5) Vci1
- Built-in internal oscillator and hardware reset
- Built-in One-Time-Programming (OTP) function for VCOM amplitude and VcomH voltage adjustment.
- Built-in separate three-gamma curves (RGB) controller to fine tune display quality.

3. ORDERING INFORMATION

Product Number	Package Type
SPFD54126B-C	Chip Form With Gold Bump

4. BLOCK DIAGRAM

4.1. Block Function

4.1.1. System Interface

The SPFD54126B supports three high-speed system interfaces:

1. 80-system high-speed interfaces with 8-, 9-, 16-, 18-bit parallel ports.
2. 68-system high-speed interfaces with 8-, 9-, 16-, 18-bit parallel ports.
3. 3-pin 9-bits Serial Peripheral Interface (SPI).

The SPFD54126B has a 16-bit index register (IR) and two 18-bit data registers, a write-data register (WDR) and a read-data register (RDR). The IR register is used to store index information from control registers. The WDR register is used to temporarily store data to be written for register control and internal GRAM. The RDR register is used to temporarily store data read from the GRAM. When graphic data is written to the internal GRAM from MCU/graphic engine, the data is first written to the WDR and then automatically written to the internal GRAM in internal operation. When graphic data read operation is executed, graphic data is read via the RDR from the internal GRAM. Therefore, invalid data is first read out to the data bus when the SPFD54126B executes the 1st read operation. Thus, valid data can be read out after the SPFD54126B executes the 2nd read operation.

4.1.2. External Display Interface

The SPFD54126B supports external RGB interface for picture movement display.

The SPFD54126B allows switching between one of the external display interfaces and the system interface via pin configuration so that the optimum interface is selected for still / moving picture displayed on the screen.

When the RGB interface is chosen, display operations are synchronized with external supplied signals, VSYNC, HSYNC, and DOTCLK. Moreover, valid display data (DB17-0) is written to GRAM, which synchronized with signal (DE) enabling.

4.1.3. Address Counter (AC)

SPFD54126B features an Address Counter (AC) giving an address to the internal GRAM. The address in the AC is automatically updated plus or minus 1. The window address function enables writing data only in the rectangular area arbitrarily set by users on the GRAM.

4.1.4. Graphics RAM (GRAM)

SPFD54126B features a 87120-byte (176 x 220x 18/8) Graphic RAM (GRAM).

4.1.5. Grayscale Voltage Generating Circuit

SPFD54126B has true 6-bit resolution D/A converter, which generates 64 Gamma-corrected values and cooperates with OP-AMP structure to enhance display quality. The grayscale voltage can be adjusted by grayscale data set in the γ -correction register. For details, see the “ γ -Correction Function” section.

4.1.6. Timing Controller

SPFD54126B has a timing controller which can generate a timing signal for internal circuit operation such as gate output timing, RAM accessing timing, etc.

4.1.7. Oscillator (OSC)

The SPFD54126B also features an internal oscillator to generate RC oscillation with an internal resistor. In standby mode, RC oscillation is halted to reduce power consumption. See “Oscillator” for details.

4.1.8. Source Driver Circuit

SPFD54126B consists of a 528-output source driver circuit (S1 ~ S528). Data in the GRAM are latched when the 528th bit data is input. The latched data controls the source driver and generates a drive waveform.

4.1.9. Gate Driver Circuit

SPFD54126B consists of a 220-output gate driver circuit (G1~G220). The gate driver circuit outputs gate driver signals at either VGH or VGL level.

4.1.10. LCD Driving Power Supply Circuit

The LCD driving power supply circuit generates the voltage levels AVDD, VGH, VGL and VCOM for driving an LCD. All this voltages can be adjusted by register setting.

Interface input Signals																													
CSX	1	I	MPU	Chip select signal. Low: the SPFD54126B is accessible																									

Signal	Pin No.	I/O	Connected with	Function
				High: the SPFD54126B is not accessible This pin has can be permanently fixed "Low" in MCU interface mode only.
D/CX (SCL)	1	I	MPU	Display data / Command selection pin in parallel interface Low: Command data High: Display data In SPI I/F, this is used as SCL pin. Must connect to the GND or VDDI level when not used.
WRX (RWX)	1	I	MPU	(A) In 80-system interface mode, a write strobe signal can be input via this pin and initializes a write operation when the signal is low. (B) In 68-system interface mode, a write or read control signal can be input via this pin and initializes a write or read operation. Must connect to the GND or VDDI level when not used.
RDX (E)	1	I	MPU	(A) In 80-system interface mode, a read strobe signal can be input via this pin and initializes a read operation when the signal is low. (B) In 68system interface mode, a strobe signal can be input via this pin and initializes a write or read operation when the signal is low. Must connect to the GND or VDDI level when not in use.
SPI_CSX	1	I	MPU	(A) When RCM [1:0] = '01' Chip select pin for SPI (Low active) (B) When RCM [1:0] = '00' or '1X' This pin is not used, and fix at VDDI or DGND level. If not used, please fix this pin at VDDI or DGND level.
SCL	1	I	MPU	(A) When RCM [1:0] = '01' Serial clock signal pin for SPI (B) When RCM [1:0] = '00' or '1X' This pin is not used, and fix at VDDI or DGND level. If not used, please fix this pin at VDDI or DGND level.
SDA	1	I/O	MPU	(A) When RCM [1:0] = '01' or '1X' Serial input/ output signal in serial I/F mode. The data is input on the rising edge of the SCL signal. The data is output on the falling edge of the SCL signal. (B) When RCM [1:0] = '00' This pin is not used, and fix at VDDI or DGND level. If not used, please fix this pin at VDDI or DGND level.
DB0-DB17	2*18	I/O	MPU	(A) When RCM [1:0] = '1X' (RGB I/F), D[17:0] are used for RGB interface data bus (B) When RCM [1:0] = '00' (MCU I/F), D[17:0] are used to MCU parallel interface data bus In SPI I/F, D0 is used as Serial input/ output signal. In SPI I/F, D[17:1] not used, please fix this pin at VDDI or DGND level. (C) When RCM [1:0] = '01' (MCU I/F), D[17:0] are used for MCU interface data bus In SPI I/F, D[17:0] not used, please fix this pin at VDDI or DGND level.
VS	1	I	MPU	In RGB I/F or VSYNC I/F mode, served as a vertical synchronize signal input Must connect to the VDDI or DGND level when not in use.
HS	1	I	MPU	In RGB I/F mode, served as a horizontal synchronized signal input Must connect to the VDDI or DGND level when not in use.
DE	1	I	MPU	In RGB I/F mode, polarity of DE signal is synchronized with valid graphic data input. High: Valid data on DB17-DB0 Low: Invalid data on DB17-DB0

Signal	Pin No.	I/O	Connected with	Function
				Must connect to the VDDI or DGND level when not in use.
PCLK	1	I	MPU	In RGB I/F mode, served as a pixel clock signal. Must connect to the VDDI or DGND level when not in use.
Charge Pump and Power Supply Signal				
C11P/N, C12P/N, C21P/N, C22P/N, C23P/N	4/4 4/4 3/3 3/3 3/3	-	Step-up capacitor	Connect boost capacitors for the internal DC/DC converter circuit to these pins. Leave the pins open when DC/DC converter circuits are not used.
VCI1	5	O	Stabilizing capacitor	An internal reference voltage level, which is regulated from VDD. The amplitude of VCI1 is from VDD-GND. Place a stabilizing capacitor between GND.
AVDD	6	O	Stabilizing capacitor	Output 2x VCI1 voltage level from the step-up circuit 1. Place a stabilizing capacitor between GND. AVDD = 4.5 ~ 5.5V
VGH	3	O	Stabilizing capacitor	An output voltage from the step-up circuit 2x, 4x ~ 6x of the VCI1 level. Connect with a stabilizing capacitor.
VGL	3	O	Stabilizing capacitor	An output voltage from the step-up circuit -2x, -3x ~ -5x of the VCI1 level. Connect with a stabilizing capacitor.
VCL	3	O	Stabilizing capacitor	An output voltage from the step-up circuit 2, -1x of the VCI1 level. Connect with a stabilizing capacitor.
VCC	5	O	Stabilizing capacitor	Reference voltage for Internal logic block Connect with a stabilizing capacitor
VREF	5	O	Stabilizing capacitor	Reference voltage for power block Connect with a stabilizing capacitor.
GVDD	4	I/O	Stabilizing capacitor	Output source driver grayscale reference voltage level.
Source/Gate Driver and VCOM Signals				
G1~G220	220	O	LCD	Output gate driver signals, which has the swing from VGH to VGL
S1~S528	528	O	LCD	Output source driver signals. The D/A converted 64-gray-scale analog voltage is output.
VCOM	6	O	TFT panel common electrode	Output a square wave signal with the swing from VcomH - VcomL to the common electrode of TFT panel. The alternating cycle can be set to frame inversion or 1-line inversion.
VcomH	4	O	Stabilizing capacitor	Output the high level of VCOM voltage. Connect with a capacitor to stabilize.
VcomL	4	O	Stabilizing capacitor or open	Output the low level of VCOM voltage. Connect with a capacitor to stabilize.
VDDIO	5	O		VDDI input voltage for control pins using
DGND0	10	O		DGND input voltage for control pins using
VDD	10	I	Stabilizing capacitor	Power supply Input for analog and booster system
VDDI	8	I	Stabilizing capacitor	Power supply Input for I/O system
DGND	12			Digital ground pin.

Signal	Pin No.	I/O	Connected with	Function
AGND	15			Analog ground pin.
Misc. Signal				
DRV	2	O		Drive signal for the power transistor of the LED booster converter
FB	1	I		LED booster regulator feedback input. Connect feedback resistive divider to GND. FB threshold is 0.6V normal.
TE	1	O	MPU	Tearing effect output pin to synchronies MCU to frame writing, activated by S/W command. When this pin is not activated (TE function OFF), this pin is DGND level.
VOTP	2	I		Power supply input for OTP function
PADA0	1	I		This pin is used for glass break detection
PADB0	1	O		This pin is used for glass break detection
PADA1/PADB1 PADA2/PADB2 PADA3/PADB3 PADA4/PADB4	8			This pin is used for chip attachment detection
TEST	18	T		Test pin. If not used, please open this pin.
Dummy	22	D		Dummy pin. If not used, please open this pin.
PREG	1	D		Dummy pin. If not used, please open this pin.
OSC	1	I		External oscillator frequency input pin for oscillator testing If not used, please open this pin.

6. INSTRUCTIONS

6.1. Outline

The SPFD54126B supports 18-bit data bus interface to configure system via accessing command register. When the command register is executed, sending the command information to specify which index register would be accessed and following the data to that control register. Moreover, register accessing operation should cooperate with DC/X, WRX, RDX signal for SPFD54126B to recognize the control instruction. And command instruction can be accomplished using all system interfaces (18-bit, 16-bit, 9-bit, 8-bit 80- or 68-system and SPI)..

6.1.1. System Function Command List and Description

Table 5.1.1 list all the system function command. After the H/W reset by RESX pin or S/W reset by SWRESET command, each internal register becomes default state (Refer "RESET TABLE" section). Commands 10h, 12h, 13h, 20h, 21h, 26h, 28h, 29h, 30h, 33h, 36h (ML parameter only), 37h, 38h and 39h are updated during V-sync when Module is in Sleep Out Mode to avoid abnormal visual effects. During Sleep In mode, these commands are updated immediately. Read status (09h), Read Display Power Mode (0Ah), Read Display MADCTR (0Bh), Read Display Pixel Format (0Ch), Read Display Image Mode (0Dh), Read Display Signal Mode (0Eh) and Read Display Self Diagnostic Result (0Fh) of these commands are updated immediately both in Sleep In mode and Sleep Out mode.

Table 6.1.1 System Function command List (1)

Instruction	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Hex)	Function

6.1.2. Panel Function Command List and Description

Table 6.1.2 list all the panel function command. Panel function command is only accessible when EXTC is pulled high state (by VDDIO).

Table 6.1.2 Panel Function command List (1)

Instruction	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Hex)	Function
RGBCTR	0	↑	1	-	1	0	1	1	0	0	0	0	(B0h)	Set RGB signal control
	1	↑	1	-	0	0	0	ICM	DP	EP	HSP	VSP		ICM: RGB data access select DP,HSP,VSP:PCLK,HS,VS polarity set
FRMCTR1	0	↑	1	-	1	0	1	1	0	0	0	1	(B1h)	In normal mode (Full colors) FP0: Front porch in normal mode BP0: Back porch in normal mode RTN0: Number of clock / one line
	1	↑	1	-	-	-	-	-	FP0 [3]	FP0 [2]	FP0 [1]	FP0 [0]		
	1	↑	1	-	-	-	-	-	BP0 [3]	BP0 [2]	BP0 [1]	BP0 [0]		
	1	↑	1	-	-	-	-	-	RTN0 [3]	RTN0 [2]	RTN0 [1]	RTN0 [0]		
FRMCTR2	0	↑	1	-	1	0	1	1	0	0	1	0	(B2h)	In Idle mode (8-colors) FP1: Front porch in idle mode BP1: Back porch in idle mode RTN1: Number of clock / one line
	1	↑	1	-	-	-	-	-	FP1 [3]	FP1 [2]	FP1 [1]	FP1 [0]		
	1	↑	1	-	-	-	-	-	BP1 [3]	BP1 [2]	BP1 [1]	BP1 [0]		
	1	↑	1	-	-	-	-	-	RTN1 [3]	RTN1 [2]	RTN1 [1]	RTN1 [0]		
FRMCTR3	0	↑	1	-	1	0	1	1	0	0	1	1	(B3h)	In partial mode + Full colors FP2: Front porch in partial mode BP2: Back porch in partial mode RTN2: Number of clock / one line
	1	↑	1	-	-	-	-	-	FP2 [3]	FP2 [2]	FP2 [1]	FP2 [0]		
	1	↑	1	-	-	-	-	-	BP2 [3]	BP2 [2]	BP2 [1]	BP2 [0]		
	1	↑	1	-	-	-	-	-	RTN2 [3]	RTN2 [2]	RTN2 [1]	RTN2 [0]		
INVCTR	0	↑	1	-	1	0	1	1	0	1	0	0	(B4h)	Display inversion control
	1	↑	1	-	0	0	0	0	0	NLA	NLB	NLC		NLA, NLB, NLC: set inversion
RGB PRCTR	0	↑	1	-	1	0	1	1	0	1	0	1	(B5h)	RGB I/F Blanking porch setting
	1	↑	1	-	-	-	-	-	VBP [3]	VBP [2]	VBP [1]	VBP [0]		Vertical back porch in RGB mode
DISSET5	0	↑	1	-	1	0	1	1	0	1	1	1	(B6h)	Display function setting
	1	↑	1	-	0	0	NO1	NO0	SDT1	STD0	EQ1	EQ0		NO: the amount of non-overlap SDT: set amount of source delay PT: No display area source/ VCOM/ Gate output control
	1	↑	1	-	0	0	0	0	PTG1	PTG0	PT1	PT0		EQ: set EQ period

“-”: Don't care, can be set to VDDI or DGND level

6.2. System Command Description
6.2.1. NOP (00h)

00H	NOP (No Operation)												
Inst / Para	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Code)
NOP	0	↑	1	-	0	0	0	0	0	0	0	0	(00H)
Parameter	No Parameter												-

NOTE: "-" Don't care, can be set to VDDI or DGND level

Description	-This command is empty command. It does not have effect on the display module. -However it can be used to terminate RAM data write or read as described in RAMWR (Memory Write), RAMHD (Memory Read) and parameter write commands.													
Restriction	-													
Register Availability	<table border="1"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>	Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

6.2.2. SWRESET (01h): Software Reset

01H	SWRESET (Software Reset)												
Inst / Para	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Code)
SWRESET	0	↑	1	-	0	0	0	0	0	0	0	1	(01H)
Parameter	No Parameter												-

NOTE: "-" Don't care, can be set to VDDI or DGND level

Description	<p>-When the Software Reset command is written, it causes a software reset. It resets the commands and parameters to their S/W Reset default values and all source & gate outputs are set to VSS (display off). (See default tables in each command description)</p> <p>Note: The Frame Memory contents are not affected by this command.</p>												
Restriction	<p>-It will be necessary to wait 5msec before sending new command following software reset.</p> <p>-The display module loads all display supplier's factory default values to the registers during 5msec.</p> <p>-If Software Reset is applied during Sleep Out mode, it will be necessary to wait <u>120msec</u> before sending Sleep Out command.</p> <p>-Software Reset command cannot be sent during Sleep Out sequence.</p>												
Register Availability	<table border="1"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>	Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

H/W Reset	Sleep In mode												

6.2.12. SLPOUT (11H): Sleep Out

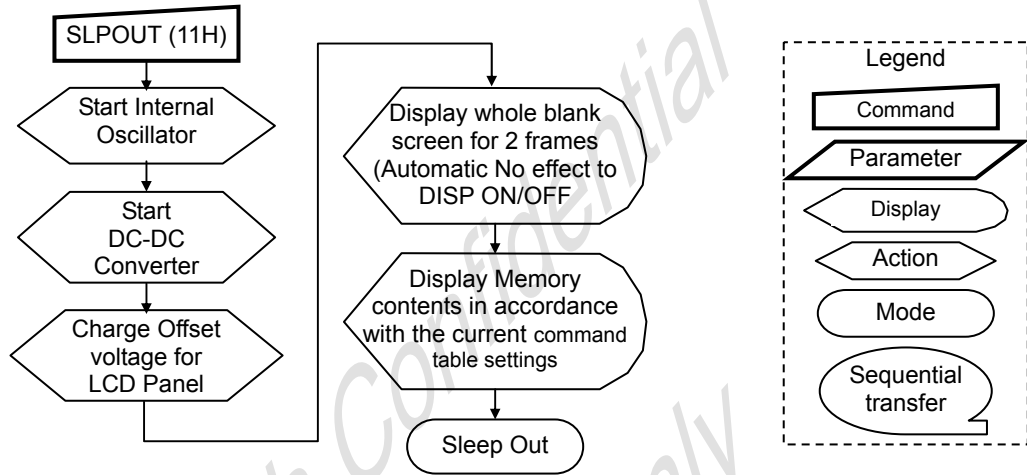

11H	SLPOUT (Sleep Out)												(Code)
Inst / Para	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	(Code)
SLPOUT	0	↑	1	-	0	0	0	1	0	0	0	1	(11H)
1 st Parameter	No Parameter												-

NOTE: "-" Don't care, can be set to VDDI or DGND level

Description	<p>-This command turns off sleep mode.</p> <p>-In this mode the DC/DC converter is enabled, Internal display oscillator is started, and panel scanning is started.</p>  <p>* Note: complete 1 frame display (ex: continue 2-falling edges of VS)</p>												
Restriction	<p>-This command has no effect when module is already in sleep out mode. Sleep Out Mode can only be exit by the Sleep In Command (10H).</p> <p>-It will be necessary to wait <u>5msec</u> before sending next command, this is to allow time for the supply voltages and clock circuits to stabilize.</p> <p>-DRIVER loads all default values of extended and test command to the registers during this 5msec and there cannot be any abnormal visual effect on the display image if those default and register values are same when this load is done and when the DRIVER is already Sleep Out mode.</p> <p>-DRIVER is doing self-diagnostic functions during this <u>5msec</u>. See also section 8.19.</p> <p>-It will be necessary to wait <u>120msec</u> after sending Sleep In command (when in Sleep Out mode) before Sleep Out command can be sent</p>												
Register Availability	<table border="1"> <thead> <tr> <th>Status</th> <th>Availability</th> </tr> </thead> <tbody> <tr> <td>Normal Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Normal Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode Off, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Partial Mode On, Idle Mode On, Sleep Out</td> <td>Yes</td> </tr> <tr> <td>Sleep In</td> <td>Yes</td> </tr> </tbody> </table>	Status	Availability	Normal Mode On, Idle Mode Off, Sleep Out	Yes	Normal Mode On, Idle Mode On, Sleep Out	Yes	Partial Mode On, Idle Mode Off, Sleep Out	Yes	Partial Mode On, Idle Mode On, Sleep Out	Yes	Sleep In	Yes

-This command defines the Vertical Scrolling Area of the display.

-When MADCTR ML=0

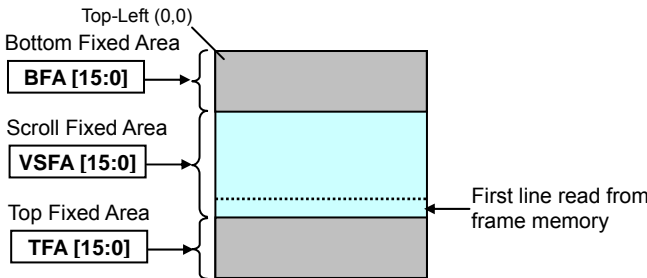

- The 1st & 2nd parameter TFA [15:0] describes the Top Fixed Area (in No. of lines from Top of the Frame Memory and Display).
- The 3rd & 4th parameter VSA [15:0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address)
- The first line appears immediately after the bottom most line of the Top Fixed Area.
- The 5th & 6th parameter BFA [15:0] describes the Bottom Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).
- TFA, VSA and BFA refer to the Frame Memory row address.

Description

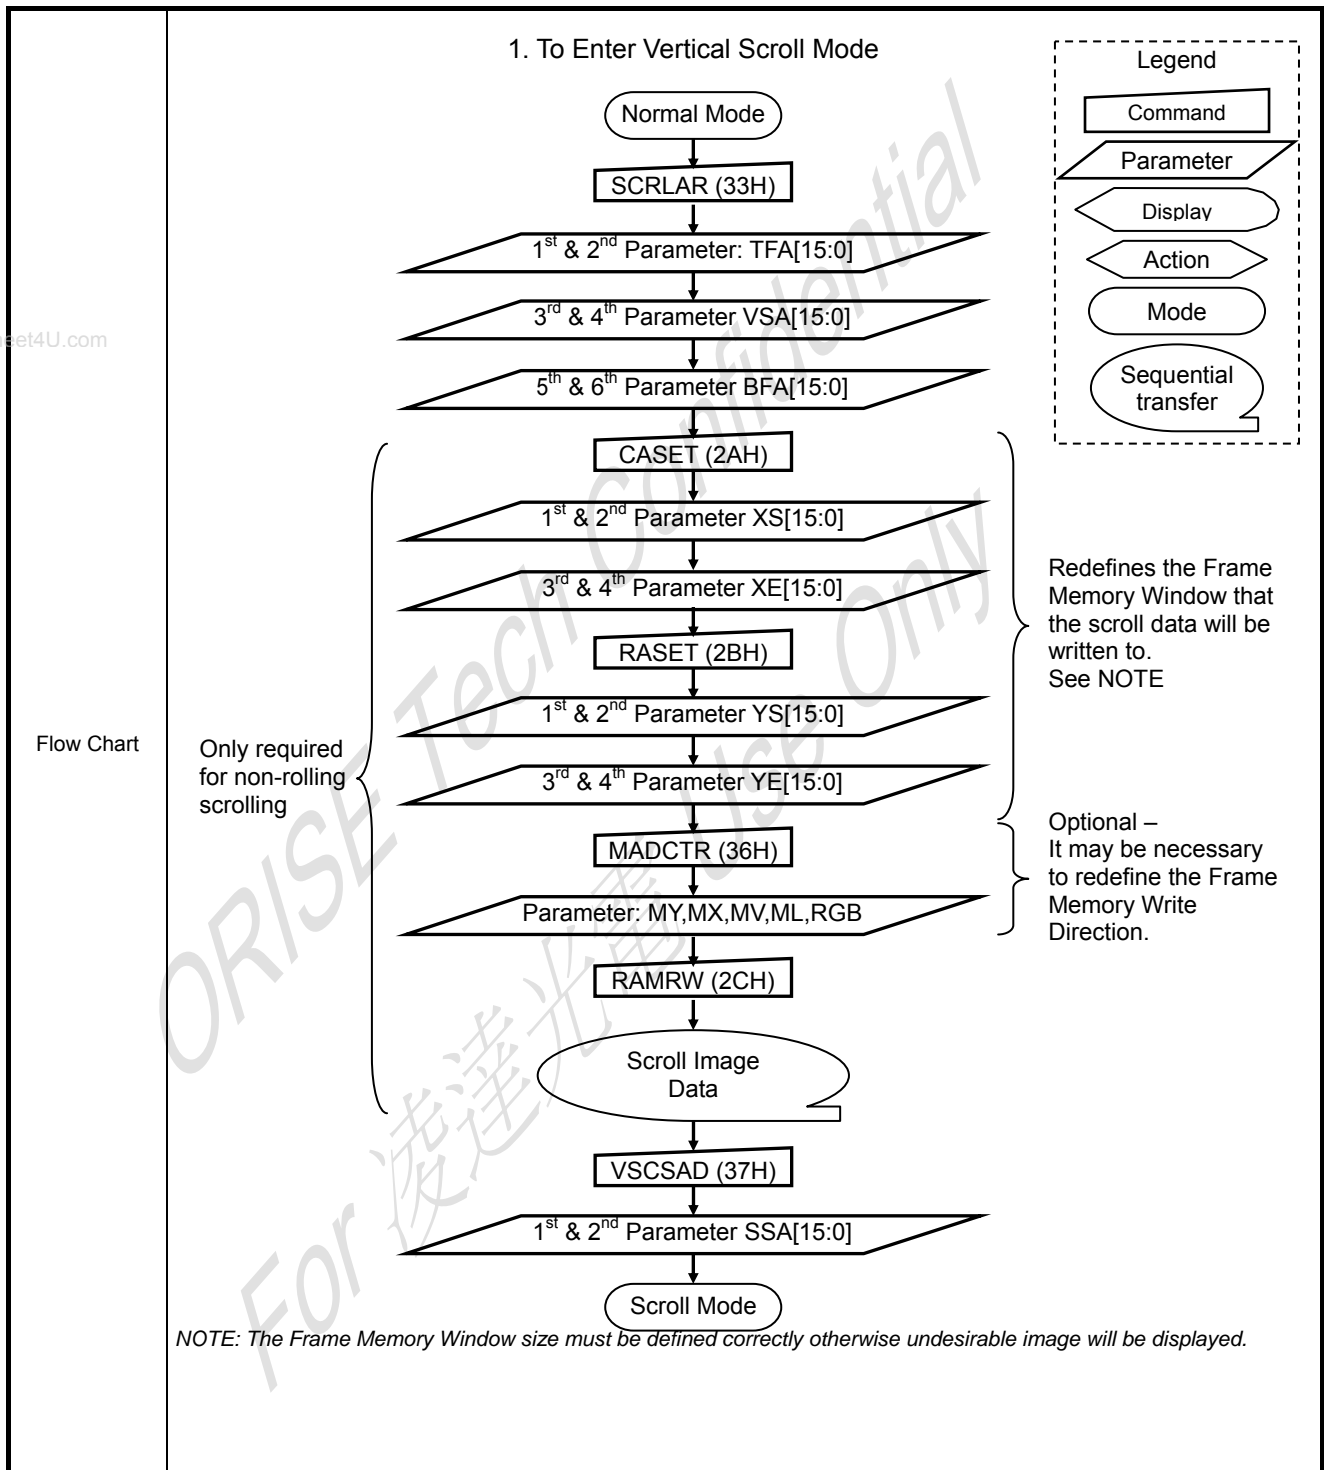

-When MADCTR ML=1

- The 1st & 2nd parameter TFA [15:0] describes the Top Fixed Area (in No. of lines from Bottom of the Frame Memory and Display).
- The 3rd & 4th parameter VSA [15:0] describes the height of the Vertical Scrolling Area (in No. of lines of the Frame Memory [not the display] from the Vertical Scrolling Start Address)
- The first line appears immediately after the top most line of the Top Fixed Area.
- The 5th & 6th parameter BFA [15:0] describes the Bottom Fixed Area (in No. of lines from Top of the Frame Memory and Display).

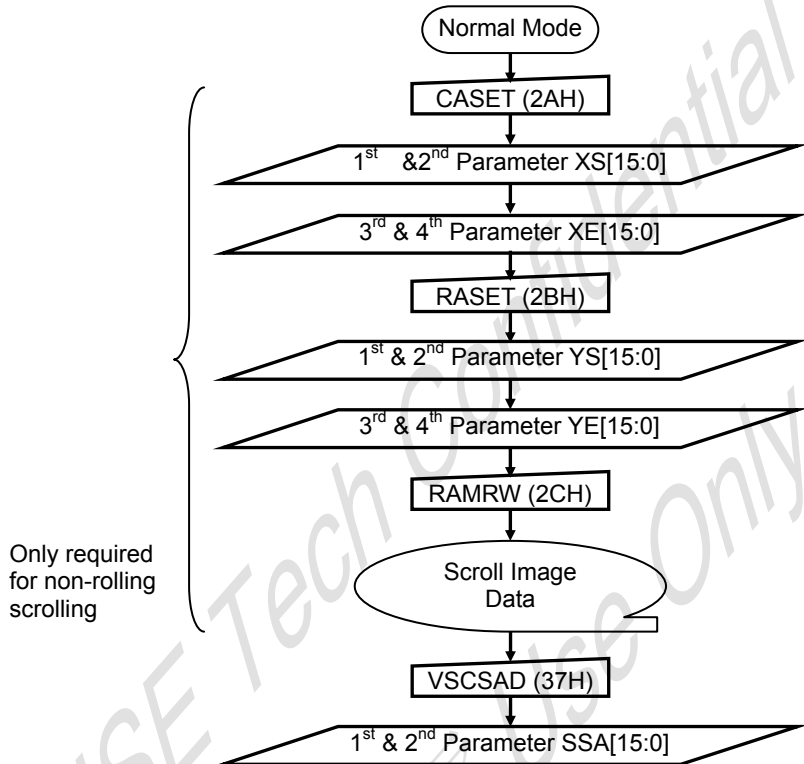

-See Section 6.5.4 for details of the Memory to Display Mapping.

Restriction	<ol style="list-style-type: none"> 176x220 memory base (GM1, GM0 = "00") -The condition is $0 \leq (TFA+VSA+BFA) \leq 220$, otherwise Scrolling mode is undefined. 176x176 memory base (GM1, GM0 = "01") -The condition is $0 \leq (TFA+VSA+BFA) \leq 176$, otherwise Scrolling mode is undefined. 176x132 memory base (GM1, GM0 = "11") -The condition is $0 \leq (TFA+VSA+BFA) \leq 132$, otherwise Scrolling mode is undefined. <p>-In Vertical Scroll Mode, MADCTR parameter MV should be set to '0'-this only affects the Frame Memory Write.</p>

2 nd Parameter	1	↑	1	-	0	0	0	0	PTG1	PTG0	PT1	PT0	

NOTE: "-" Don't care

 -1st parameter: Set output waveform relation.

-NO[1:0]: Set the amount of non-overlap of the gate output

NO[1:0]		Amount of non-overlap of the gate output	
		Refer the Internal oscillator	Refer the PCLK
00	0	1 clock cycle	4 clock cycle
01	1	4 clock cycle	16 clock cycle
10	2	6 clock cycle	24 clock cycle
11	3	8 clock cycle	32 clock cycle

-SDT[1:0]: Set delay amount from gate signal falling edge of the source output.

SDT[1:0]		Amount of non-overlap of the source output	
		Refer the Internal oscillator	Refer the PCLK
00	0	1 clock cycle	4 clock cycle
01	1	2 clock cycle	8 clock cycle
10	2	3 clock cycle	12 clock cycle
11	3	4 clock cycle	16 clock cycle

-EQ[1:0]: Set the Equalizing period

EQ[1:0]		EQ period	
		Refer the Internal oscillator	Refer the PCLK
00	0	No EQ	No EQ
01	1	2 clock cycle	4 clock cycle
10	2	4 clock cycle	16 clock cycle
11	3	6 clock cycle	24 clock cycle

Description

 -2nd parameter: Set the output waveform in non-display area.

-PTG[1:0]: Determine gate output in a non-display area in the partial mode

PTG[1:0]		Gate output in a non-display area	
00	0	Normal scan	
01	1	Fix on VGL	
10	2	Fix on VGL	
11	3	Fix on VGL	

-PT[1:0]: Determine Source /VCOM output in a non-display area in the partial mode

PT[1:0]		Source output on non-display area		VCOM output on non-display area	
		Positive	Negative	Positive	Negative
00	0	V63	V0	VCOML	VCOMH
01	1	V0	V63	VCOML	VCOMH
10	2	AGND	AGND	AGND	AGND
11	3	Hi-z	Hi-z	AGND	AGND

Flow Chart	<p>The flow chart illustrates the sequence of operations for the RDVMOF (BEH) register. It is divided into two modes: Serial I/F Mode and Parallel I/F Mode. In Serial I/F Mode, the register is accessed via a command (rectangle) labeled 'RDVMOF (BEH)', which leads to an action (arrowhead) labeled 'Send VMF[5:0]'. In Parallel I/F Mode, the register is accessed via a command (rectangle) labeled 'RDVMOF (BEH)', which leads to a parameter (parallelogram) labeled 'Dummy Read', followed by an action (arrowhead) labeled 'Send VMF[5:0]'. A 'Host Driver' label is positioned between the two modes. A legend on the right defines the symbols: a rectangle for 'Command', a parallelogram for 'Parameter', an oval for 'Display', an arrowhead for 'Action', a rounded rectangle for 'Mode', and a cloud shape for 'Sequential transfer'.</p>

7. FUNCTION DESCRIPTION

7.1. MCU & RGB Interface

The SPFD54126B features System interfaces and RGB interface to satisfy various needs of small or medium size's LCD panel. Based on the application requirements, there are two display modes mostly used in the LCD end product.

1. Still picture display mode
2. Moving picture display mode.

System interface is suitable for still picture display while RGB interface are suitable for moving picture display. Table 6.1 summarizes different interfaces for various display requirements.

Table 7.1 MCU & RGB Interface Comparisons table

Function	RCM1, RCM0				RCM1, RCM0			
	"00"		"01"		"10"		"11"	
Mode selection 1	8080/ 6800 IF + SPI I/F				RGB I/F + SPI I/F			
	MCU Mode 1		MCU Mode 2		RGB Mode 1		RGB Mode 2	
Mode selection 2	IM2='1'	IM2='0'	IM2='1'	IM2='0'	ICM='0'	ICM='1'	ICM='0'	ICM='1'
	8080/ 6800 IF	SPI I/F	8080/ 6800 IF	SPI I/F	RGB-1 I/F + SPI I/F		RGB-2 I/F + SPI I/F	
Motion /Still selection	Motion or Still	Still	Motion or Still	Still	Motion or Still	Still	Motion or Still	Still
Input data	D[B:0]	D0 = SDA	D[B:0]	SDA H/W pin	D[B:0]	SDA H/W pin	D[B:0]	SDA H/W pin
Input signal	CSX	D/CX = SCL	CSX	SCL H/W pin	PCLK	D/CX = SCL	PCLK	D/CX = SCL
	WRX (R/WX), RDX (E)	CSX	WRX (R/WX), RDX (E)	SPI_CSX	VS, HS, DE	CSX	VS, HS, DE	CSX
GRAM Write cycle	Refer WRX	Refer SCL	Refer WRX	Refer SCL	Refer PCLK	Refer SCL	Refer PCLK	Refer SCL
GRAM Read Cycle	Refer Internal Oscillator		Refer Internal Oscillator		Refer PCLK	Refer Internal Oscillator	Refer PCLK	Refer Internal Oscillator
Command setting	D[7:0]	D0 = SDA	D[7:0]	SDA H/W pin	SDA	SDA H/W pin	SDA	SDA H/W pin
SMX, SMY, SRGB	-When Power On or H/W reset, those function follow H/W pins setting first.							
VSYNC I/F	-By command setting		-By command setting		-No support this function in these modes			
TE Function	-Default is OFF		-Default is ON		-By command setting			
Normal / Partial mode	-By command setting				-By command setting			
Idle Mode (IDM H/W pin)	-By command setting -Don't care in this mode, but should be set to VDDI or DGND.					-By IDM H/W pin -IDM On/OFF (39H/28H) are disable		
Display On/ Off (SHUT H/W pin)						-By SHUT H/W pin -SLPIN(10H), SLPOUT(11H), Display On/OFF (29h/28H) are disable		
Data inverter (REV H/W pin)						-By REV H/W pin -INVON/OFF (21H/20H) are disable		
DE H/W pin	-Don't care in this mode, but should be set to VDDI or DGND				-The data latched by rising edge of PCLK when DE='1'		-When DE='0' area, output is blanking display	
RL H/W pin					-When display data coming the DE signal should be VDDI level			
TB H/W pin					-Don't care in this mode, but should be set to VDDI or DGND		-By H/W pin -No commands conflict	
Blanking porch	-Don't care in this mode				-Control by DE signal		-Control by RGBBPCTR (D5)	
Colors Format	-Control by IFPF[2:0] of COLMOD(3AH)				-Control by VIPF[3:0] of COLMOD (3AH)			

Note 1: RCM1 and RCM0 are H/W setting pins.

Note 2: In RGB + SPI I/F (RCM="1x"), VS, HS, DE, PCLK and D[17:0] are Hi-Z by Driver and can be stop for Host, when ICM='1'.

Note 3: In RGB + SPI I/F (RCM="1x"), the data deliver via GRAM

Note 4: When Power on Driver IC should be detect SMX, SMY, SRGB H/W setting

Note 5: When Power on Driver IC should be detect RCM1, RCM0 H/W setting and get into the I/F mode.

Note 6: When Power on Driver IC should be detect LCM1, LCM0 H/W setting and get into the setting mode.

Note 7: When Power on Driver IC should be detect GM1, GM0 H/W setting and get into the setting mode.

7.2. MPU Interface

7.2.1. Interface Type Selection

The MPU interfaces of SPFD54126B support 8-bit, 9-bit, 16-bit, and 18-bit's 80- or 68-system Interface and Serial Peripheral Interface (SPI), which can be set by the P68 and IM2/1/0 pins. The MPU interface can set instructions and access RAM. Table 6.2.1 depicts the interface corresponding to P68 and IM2/1/0 settings.

Table 7.2.1

P68	IM2	IM1	IM0	Interface	Read back selection
0	0	-	-	3-Pin Serial interface	Via the read instruction (8-bits, 24-bits and 32-bits read parameter)
0	1	0	0	8080 MCU 8-bits Parallel	RDX strobe (8-bits read data and 8-bits read parameter)
0	1	0	1	8080 MCU 16-bits Parallel	RDX strobe (16-bits read data and 8-bits read parameter)
0	1	1	0	8080 MCU 9-bits Parallel	RDX strobe (9-bits read data and 8-bits read parameter)
0	1	1	1	8080 MCU 18-bits Parallel	RDX strobe (18-bits read data and 8-bits read parameter)
1	0	-	-	3-Pin Serial interface	Via the read instruction (8-bits, 24-bits and 32-bits read parameter)
1	1	0	0	6800 MCU 8-bits Parallel	E strobe (8-bits read data and 8-bits read parameter)
1	1	0	1	6800 MCU 16-bits Parallel	E strobe (16-bits read data and 8-bits read parameter)
1	1	1	0	6800 MCU 9-bits Parallel	E strobe (9-bits read data and 8-bits read parameter)
1	1	1	1	6800 MCU 18-bits Parallel	E strobe (18-bits read data and 8-bits read parameter)

7.2.2. 8080-Series Parallel interface(P68='0')

The MCU uses a 11-wires 8-data parallel interface or 19-wires 16-data parallel interface or 12-wires 9-data parallel interface or 21-wires 18-data parallel interface. The chip-select CSX(active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. WRX is the parallel data write, RDX is the parallel data read and D[17:0] is parallel data.

The Graphics Controller Chip reads the data at the rising edge of WRX signal. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits are display RAM data or command parameters. When D/C='0', D[17:0] bits are commands.

The 8080-series bi-directional interface can be used for communication between the micro controller and LCD driver chip. The selection of this interface is done when P68 pin is low state (DGND). Interface bus width can be selected with IM2, IM1 and IM0.

The interface function of 8080-series parallel interface are given in Table 6.2.2

Table 7.2.2 The function of 8080-series parallel interface

P68	IM2	IM1	IM0	Interface	D/CX	RDX	WRX	Function
0	1	0	0	8-bits Parallel	0	1	↑	Write 8-bits command (D7 to D0)
					1	1	↑	Write 8-bits display data or 8-bits parameter (D7 to D0)
					1	↑	1	Read 8-bits command (D7 to D0)
					1	↑	1	Read 8-bits parameter or status (D7 to D0)
0	1	0	1	16-bits Parallel	0	1	↑	Write 8-bits command (D7 to D0)
					1	1	↑	Write 16-bits display data (D15 to D0) or 8-bits parameter (D7 to D0)
					1	↑	1	Read 8-bits command (D7 to D0)
					1	↑	1	Read 8-bits parameter or status (D7 to D0)
0	1	1	0	9-bits Parallel	0	1	↑	Write 8-bits command (D7 to D0)
					1	1	↑	Write 9-bits display data (D8 to D0) or 8-bits parameter (D7 to D0)
					1	↑	1	Read 8-bits command (D7 to D0)
					1	↑	1	Read 8-bits parameter or status (D7 to D0)
0	1	1	1	18-bits Parallel	0	1	↑	Write 8-bits command (D7 to D0)
					1	1	↑	Write 18-bits display data (D17 to D0) or 8-bits parameter (D7 to D0)
					1	↑	1	Read 8-bits command (D7 to D0)
					1	↑	1	Read 8-bits parameter or status (D7 to D0)

7.2.2.1. Write cycle sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (WRX high-low-high sequence) consists of 3 control (D/CX, RDX, WRX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (= '0') and vice versa it is data (= '1').

Fig. 7.2.2.1.1 8080-Series WRX Protocol

Note: WRX is an unsynchronized signal (It can be stopped)

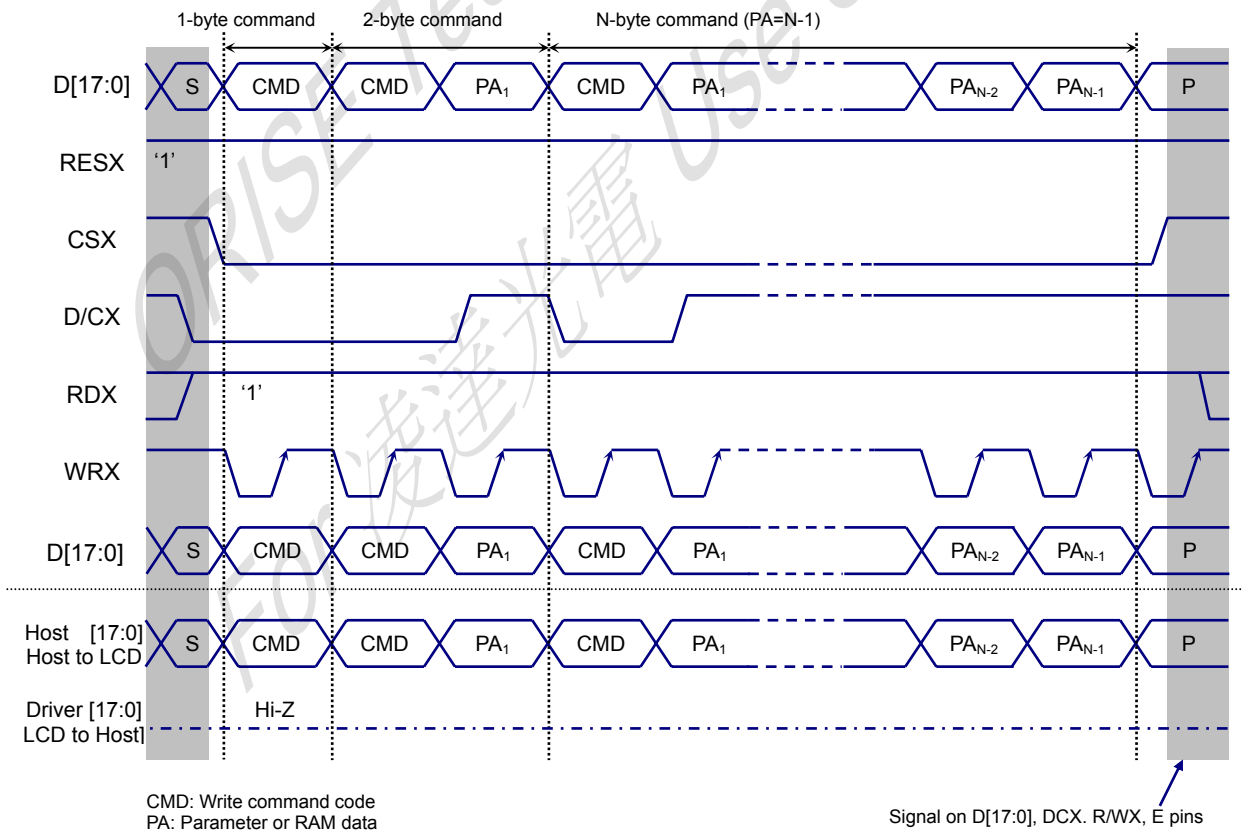

Fig. 7.2.2.1.2 8080-Series parallel bus protocol, Write to register or display RAM

7.2.2.2. Read Cycle Sequence

The read cycle (RDX high-low-high sequence) means that the host reads information from display via interface. The display sends data (D[17:0]) to the host when there is a falling edge of RDX and the host reads data when there is a rising edge of RDX.

Fig. 7.2.2.2.1 8080-Series RDX Protocol

Note: RDX is an unsynchronized signal (It can be stopped)

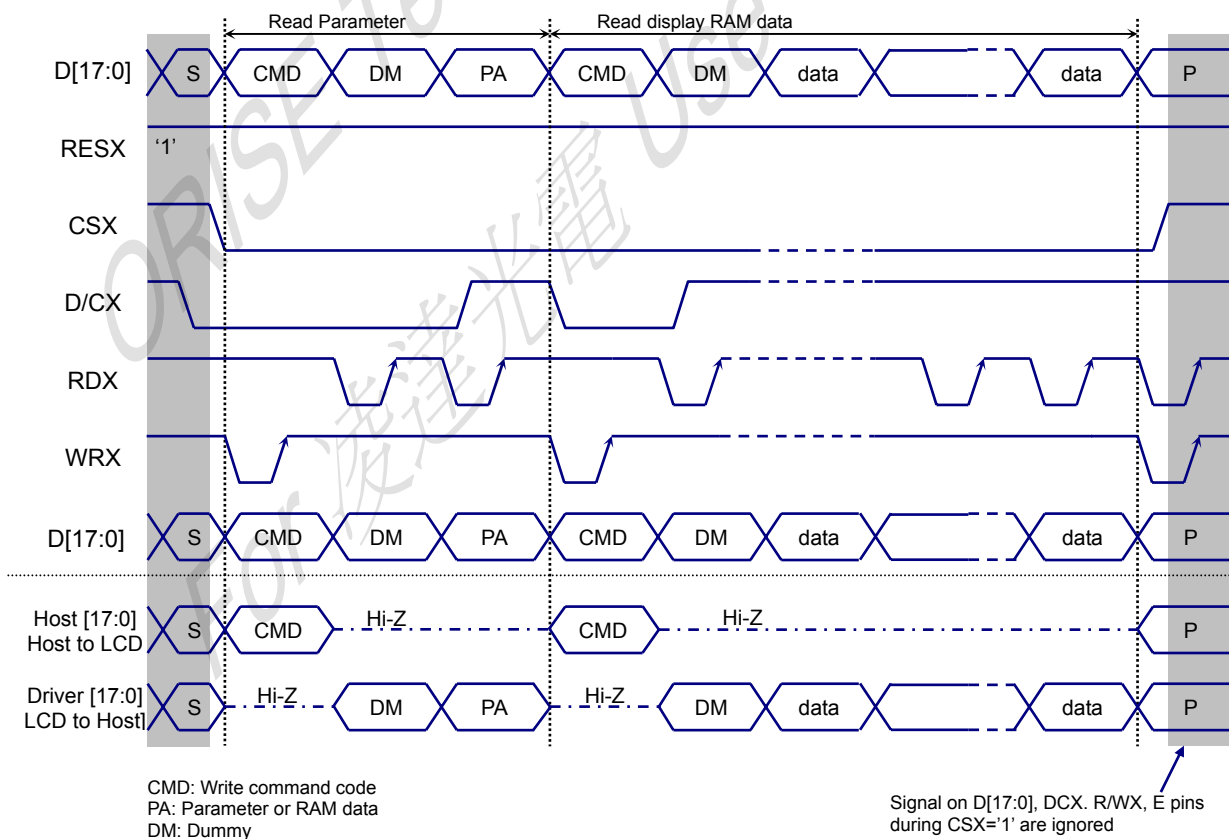

Fig. 7.2.2.2.2 8080-Series parallel bus protocol, Read data from register or display RAM

7.2.3. 6800-Series Parallel Interface (P68='1')

The MCU uses a 11-wires 8-data parallel interface or 19-wires 16-data parallel interface or 12-wires 9-data parallel interface or 21-wires 18-data parallel interface. The chip-select CSX(active low) enables and disables the parallel interface. RESX (active low) is an external reset signal. The R/WX is the Read/Write flag and D[17:0] is parallel data.

The Graphics Controller Chip reads the data at the falling edge of E signal when R/WX='1' and Writes the data at the falling of the E signal when R/WX='0'. The D/CX is the data/command flag. When D/CX='1', D[17:0] bits are display RAM data or command parameters. When D/C='0', D[17:0] bits are commands.

The 6800-series bi-directional interface can be used for communication between the micro controller and LCD driver chip. The selection of this interface is done when P68 pin is high state (VDDI). Interface bus width can be selected with IM2, IM1 and IM0.

The interface functions of 6800-series parallel interface are given in Table 7.2.3.

Table 7.2.3 The function of 6800-series parallel interface

P68	IM2	IM1	IM0	Interface	D/CX	R/WX	E	Function
1	1	0	0	8-bits Parallel	0	0	↓	Write 8-bits command (D7 to D0)
					1	0	↓	Write 8-bits display data or 8-bits parameter (D7 to D0)
					1	1	↓	Read 8-bits command (D7 to D0)
					1	1	↓	Read 8-bits parameter or status (D7 to D0)
1	1	0	1	16-bits Parallel	0	0	↓	Write 8-bits command (D7 to D0)
					1	0	↓	Write 16-bits display data (D15 to D0) or 8-bits parameter (D7 to D0)
					1	1	↓	Read 8-bits command (D7 to D0)
					1	1	↓	Read 8-bits parameter or status (D7 to D0)
1	1	1	0	9-bits Parallel	0	0	↓	Write 8-bits command (D7 to D0)
					1	0	↓	Write 9-bits display data (D8 to D0) or 8-bits parameter (D7 to D0)
					1	1	↓	Read 8-bits command (D7 to D0)
					1	1	↓	Read 8-bits parameter or status (D7 to D0)
1	1	1	1	18-bits Parallel	0	0	↓	Write 8-bits command (D7 to D0)
					1	0	↓	Write 18-bits display data (D17 to D0) or 8-bits parameter (D7 to D0)
					1	1	↓	Read 8-bits command (D7 to D0)
					1	1	↓	Read 8-bits parameter or status (D7 to D0)

7.2.3.1. Write cycle sequence

The write cycle means that the host writes information (command or/and data) to the display via the interface. Each write cycle (E low-high-low sequence) consists of 3 control (D/CX, E, R/WX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (= '0') and vice versa it is data (= '1').

Fig. 7.2.3.1.1 6800-Series Write Protocol

Note: E is an unsynchronized signal (It can be stopped)

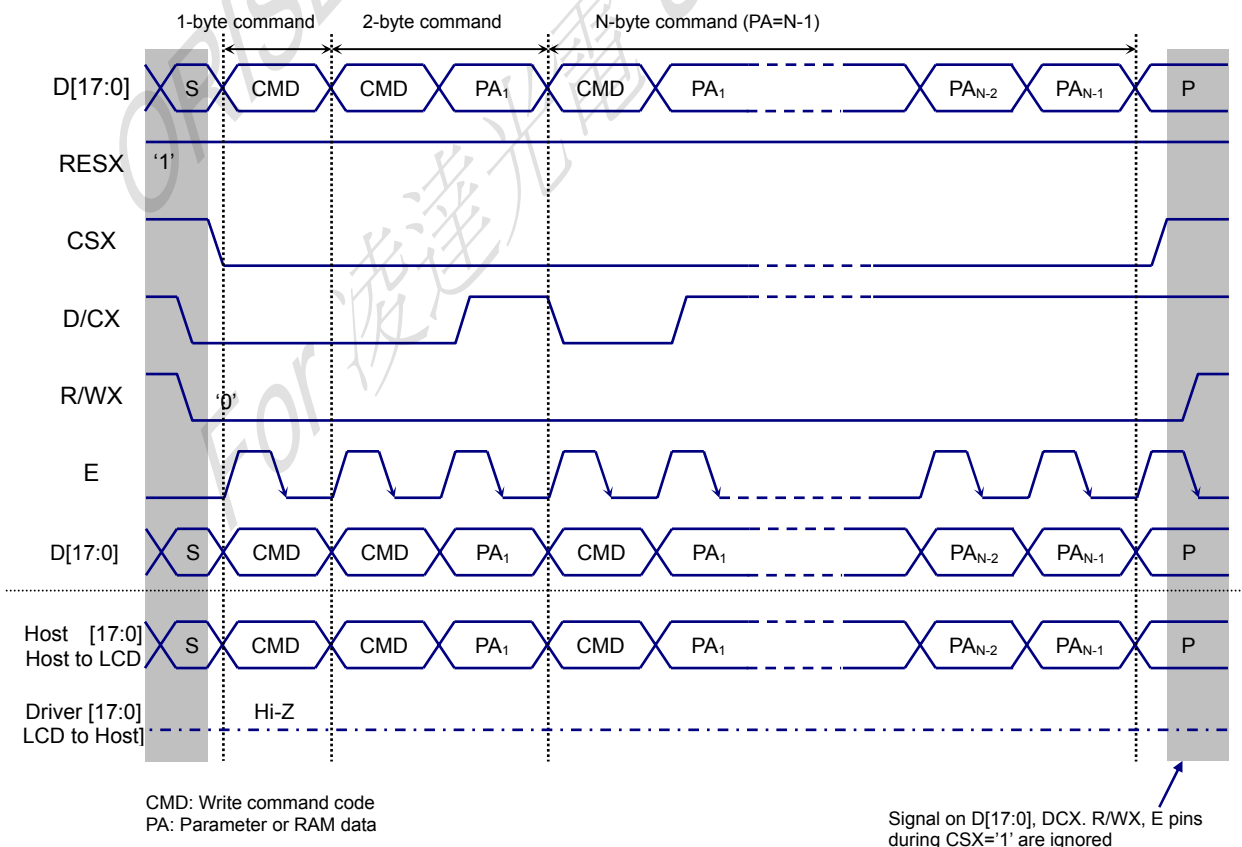

Fig. 7.2.3.1.2 6800-Series parallel bus protocol, Write to register or display RAM

7.2.3.2. Read cycle sequence

The read cycle means that the host reads information (command or/and data) to the display via the interface. Each read cycle (E low-high-low sequence) consists of 3 control (D/CX, E, R/WX) and data signals (D[17:0]). D/CX bit is a control signal, which tells if the data is a command or a data. The data signals are the command if the control signal is low (= '0') and vice versa it is data (= '1').

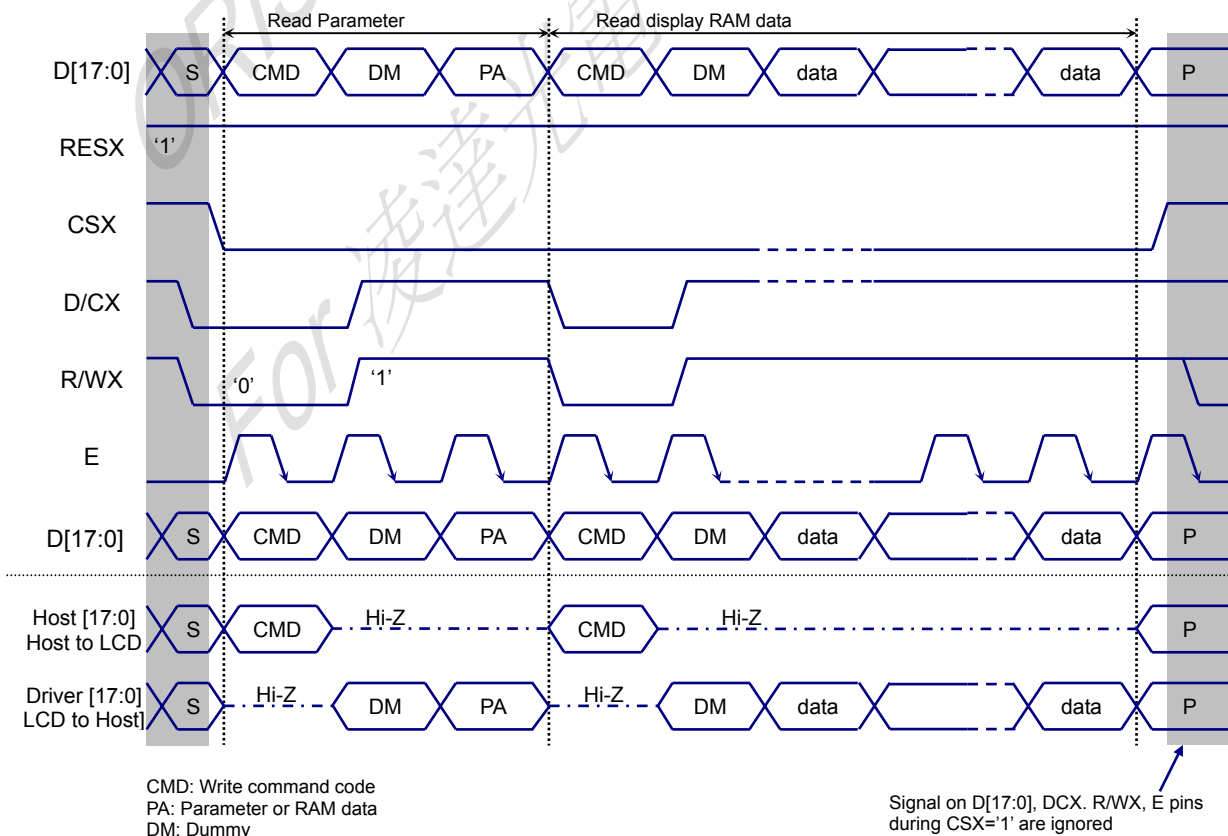

Fig. 7.2.3.2.1 6800-Series Read Protocol

Note: E is an unsynchronized signal (It can be stopped)

CMD: Write command code
PA: Parameter or RAM data
DM: Dummy

Signal on D[17:0], DCX, R/WX, E pins during CSX='1' are ignored

Fig. 7.2.3.2.2 6800-Series parallel bus protocol, Read data from register or display RAM

7.2.4. Serial Peripheral interface (SPI)

The selection of this interface is done by IM2. See the Table 7.2.4.

The serial interface is a 3-pin 9-bits bi-directional interface for communication between the micro controller and the LCD driver chip. The 3-pin serial use: CSX (chip enable), SCL (serial clock) and SDA (serial data input/output). Serial clock (SCL) is used for interface with MCU only, so it can be stopped when no communication is necessary.

Table 7.2.4 Serial Interface Type Selection

P68	IM2	IM1	IM0	Interface	Read back selection
0	0	-	-	3-Pin Serial interface	Via the read instruction (8-bits, 24-bits and 32-bits read parameter)

7.2.4.1. Command Write Mode

The write mode of the interface means the micro controller writes commands and data to the 3-Pin serial data packet contains a control bit D/CX and a transmission byte. If D/CX is low, the transmission byte is interpreted as command byte. If D/CX is high, the transmission byte is stored in the display data RAM (Memory write command), or command register as parameter.

Any instruction can be sent in any order to the DRIVER. The MSB is transmitted first. The serial interface is initialized when CSX is high. In this state, SCL clock pulse or SDA data have no effect. A falling edge on CSX enables the serial interface and indicates the start of data transmission.

3-pin Serial Data Stream Format

Fig. 7.2.4.1.1 Serial interface data Stream format

When CSX is high, SCL clock is ignored. During the high time of CSX the serial interface is initialized. At the falling edge of CSX, SCL can be high or low. SDA is sampled at the rising edge of CSX. D/CX indicates, whether the byte is command code (D/CX=0) or parameter/RAM data (D/CX=1). It is sampled when first rising edge of CSX. If CSX stay low after the last bit of command/data byte, the serial interface expects the D/CX bit of the next byte at the next rising edge of SCL.

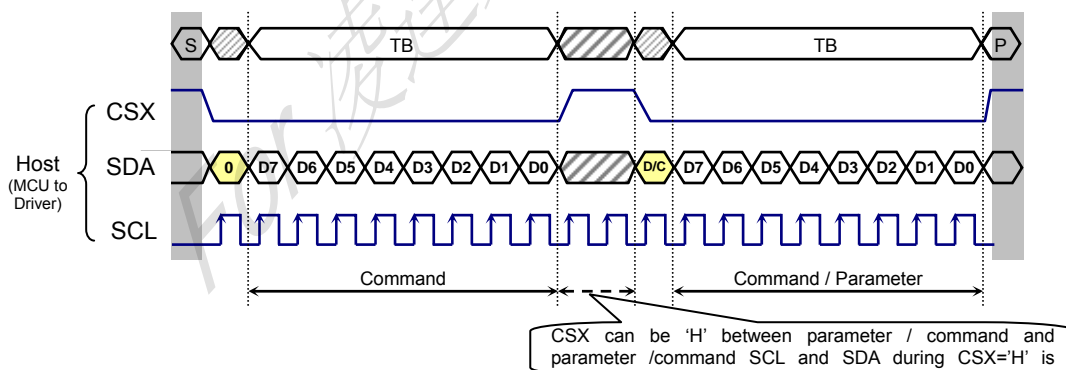

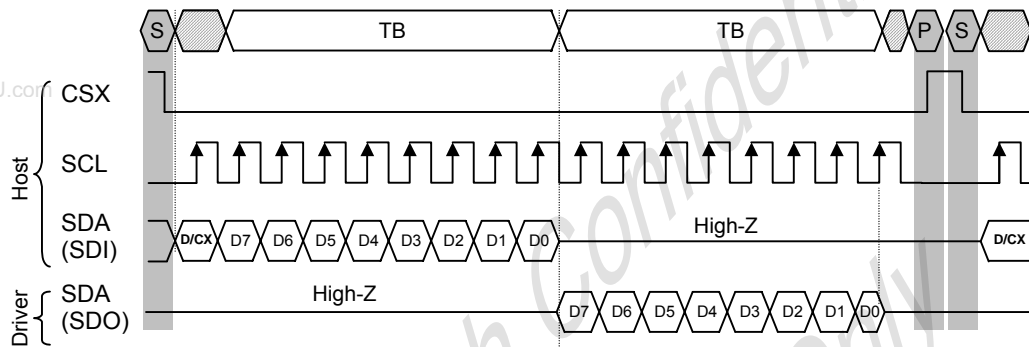

Fig. 7.2.4.1.2 Serial interface Write protocol (Write to register with control bit in transmission)

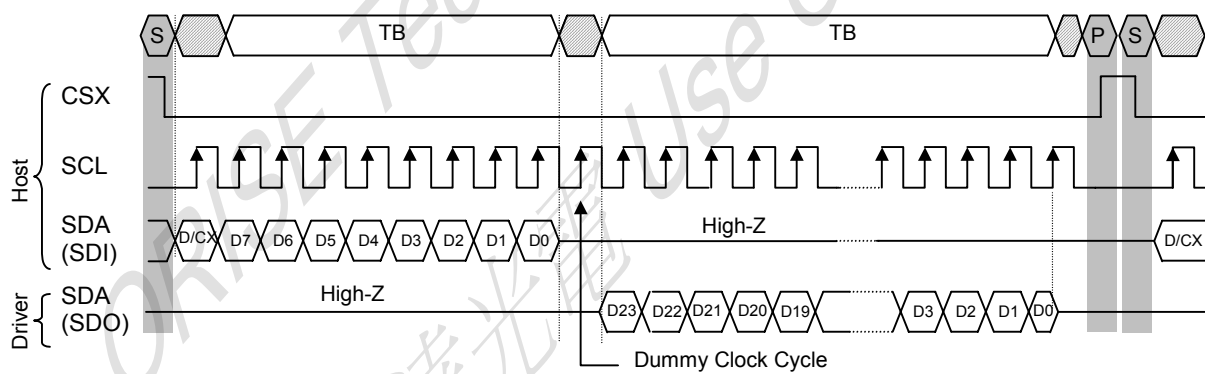

7.2.4.2. Read Functions

The read mode of the interface means that the micro controller reads register value from the Driver. To do the micro controller first has to send a command (Read ID or register command) and then the following byte is transmitted in the opposite direction. After the read status command has been sent, the SDA lin must be set to tri-state no later than at the falling edge of SCL of the last bit.

3-Pin Serial Protocol (for RDID1/RDID2/RDID3/0Ah/0Bh/0Ch/0Dh/0Eh/0Fh command: 8-bit read)

3-Pin Serial Protocol (for RDDID command: 24-bit read)

3-Pin Serial Protocol (for RDDST command: 32-bit read)

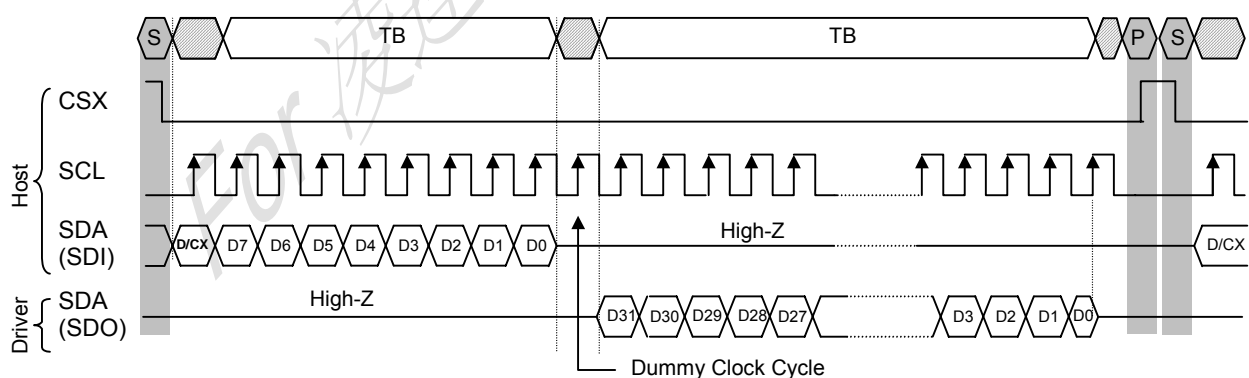

Fig. 7.2.4.2.1 3-pin Serial interface Read protocol

7.2.5. Data Transfer Break and Recovery

If there is a break in data transmission by RESX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then DRIVER will reject the previous bits and have reset the interface such that it will be ready to receive command data again when the chip select line (CSX) is next activated after RESX have been High state. See the following example

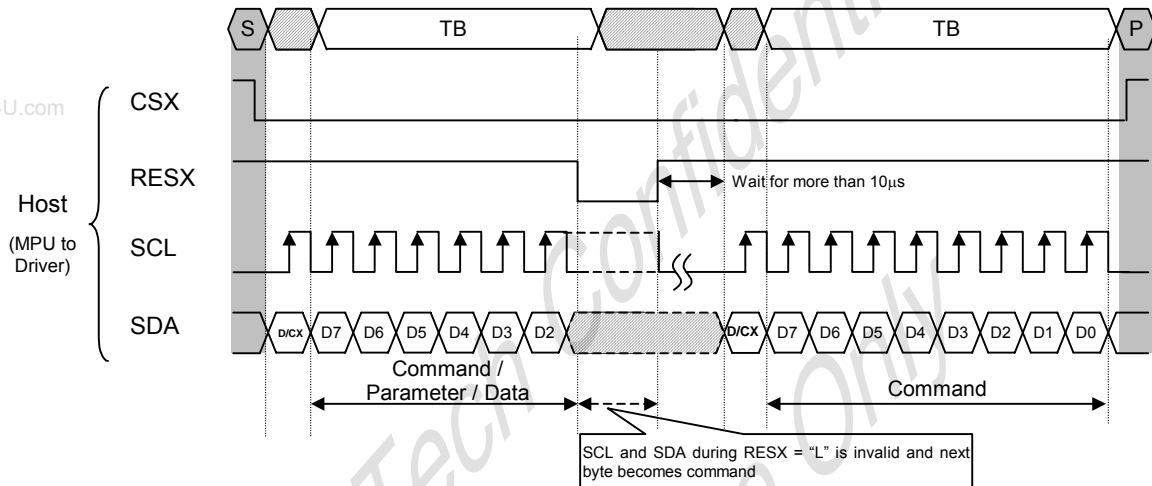

Fig. 7.2.5.1 Serial bus protocol, write mode – interrupted by RESX

If there is a break in data transmission by CSX pulse, while transferring a Command or Frame Memory Data or Multiple Parameter command Data, before Bit D0 of the byte has been completed, then DRIVER will reject the previous bits and have reset the interface such that it will be ready to receive the same byte re-transmitted when the chip select line (CSX) is next activated. See the following example

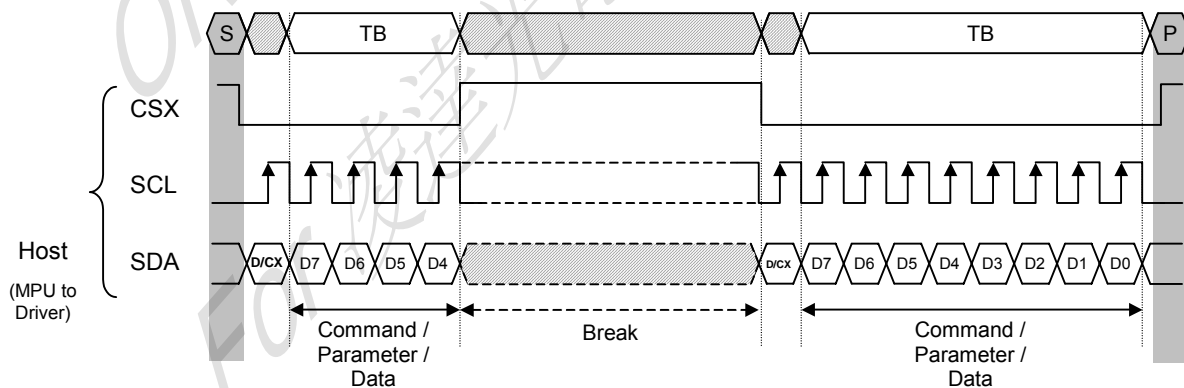

Fig. 7.2. 5.2 Serial bus protocol, write mode – interrupted by CSX

If 1, 2 or more parameter command is being sent and a break occurs while sending any parameter before the last one and if the host then sends a new command rather than re-transmitting the parameter that was interrupted, then the parameters that were successfully sent are stored and the parameter where the break occurred is rejected. The interface is ready to receive next byte as shown below.

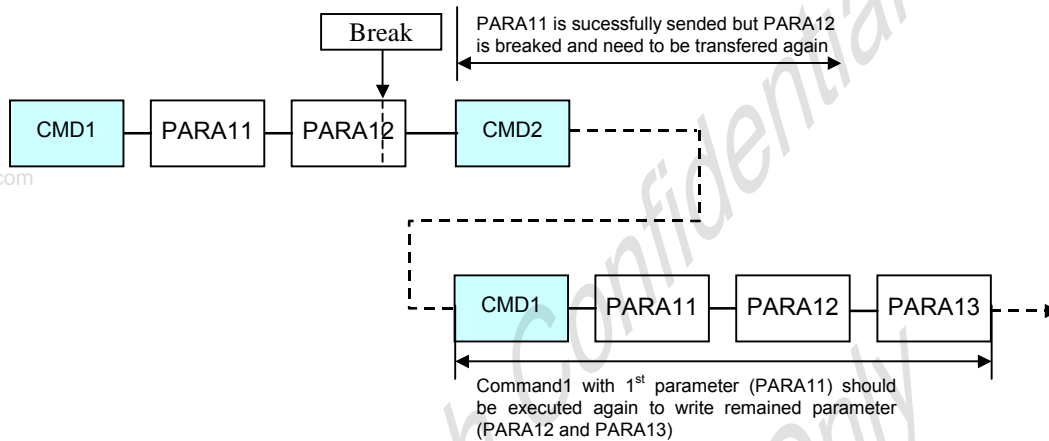

Fig.7.2.5.3 Write interrupts recovery (serial interface)

If a 2 or more parameter command is being sent and a break occurs by the other command before the last one is sent, then the parameters that were successfully sent are stored and the other parameter of that command remains previous value.

Fig. 7.2.5.4 Write interrupts recovery (both serial and parallel interface)

7.2.6. Data Transfer Pause

It will be possible when transferring a Command, Frame Memory Data or Multiple Parameter Data to invoke a pause in the data transmission. If the Chip Select Line is released after a whole byte of a Frame Memory Data or Multiple Parameter Data has been completed, then DRIVER will wait and continue the Frame Memory Data or Parameter Data Transmission from the point where it was paused. If the Chip Select Line is released after a whole byte of a command has been completed, then the Display Module will receive either the command's parameters (if appropriate) or a new command when the Chip Select Line is next enabled as shown below.

This applies to the following 4 conditions:

- 1) Command-Pause-Command
- 2) Command-Pause-Parameter
- 3) Parameter-Pause-Command
- 4) Parameter-Pause-Parameter

7.2.6.1. Serial Interface Pause

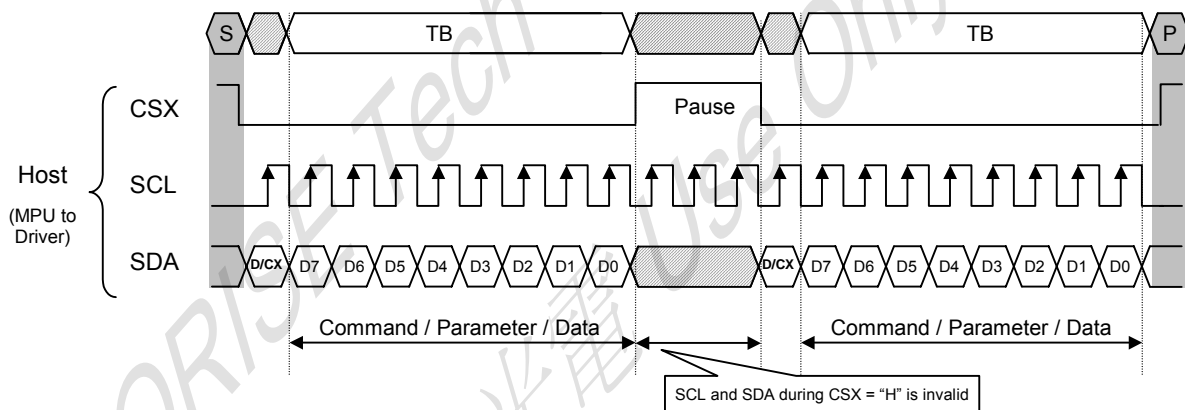

Fig. 7.2.6.1 Serial interface Pause Protocol (pause by CSX)

7.2.6.2. Parallel Interface Pause

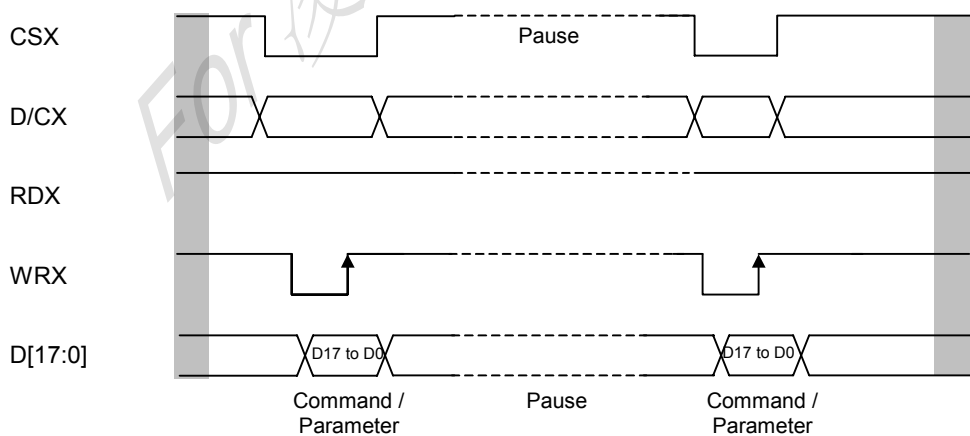

Fig. 7.2.6.2 Parallel bus Pause Protocol (paused by CSX)

7.2.7. Data Transfer Modes

The Module has three kinds colour modes for transferring data to the display RAM. These are 12-bit colour per pixel, 16-bit colour per pixel and 18-bit colour per pixel. The data format is described for each interface. Data can be downloaded to the Frame Memory by 2 methods.

7.2.7.1. Method 1

The Image data is sent to the Frame Memory in successive Frame writes, each time the Frame Memory is filled, the Frame Memory pointer is reset to the start point and the next Frame is written.

7.2.7.2. Method 2

Image Data is sent and at the end of each Frame Memory download, a command is sent to stop Frame Memory Write. Then Start Memory Write command is sent, and a new Frame is downloaded.

Note:

- 1) These apply to all data transfer Colour modes on both serial and parallel interfaces.
- 2) The frame memory can contain both odd and even number of pixels for both methods. Only complete pixel data will be stored in the frame memory.

7.3. MCU Data Colour Coding
7.3.1. MCU Data Colour Coding for RAM data Write

- Parallel 8-Bits Bus Interface (IM1, IM0= "00")

Note: 'x' Don't care, but need to set VDDI or DGND level.

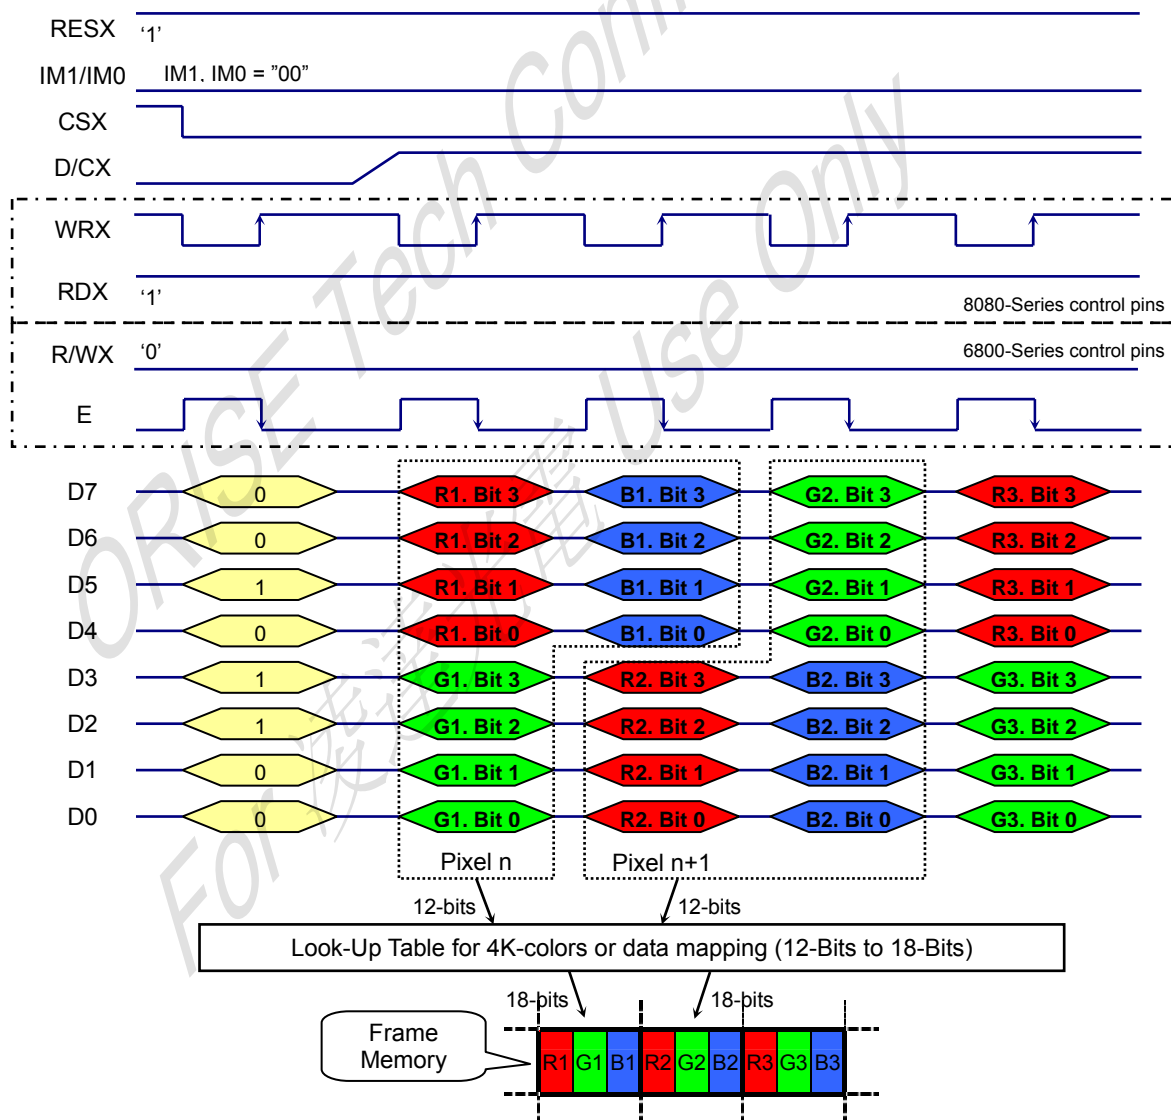

7.3.1.1. Parallel 8-Bits Bus Interface for RAM Data Write (IM1, IM0= "00")

Different display data formats are available for three colours depth supported by listed below.

- 4K-Colours, RGB 4,4,4-bits input data. (3AH="03h")
- 65K-Colours, RGB 5,6,5-bits input data. (3AH="05h")
- 262K-Colours, RGB 6,6,6-bits input data. (3AH="06h")

(1). 8-bits data bus for 12-bits/pixel (RGB 4-4-4-bits input), 4K-colours, 3AH="03h"

There are 2 pixels (6 sub-pixels) per 3-bytes.

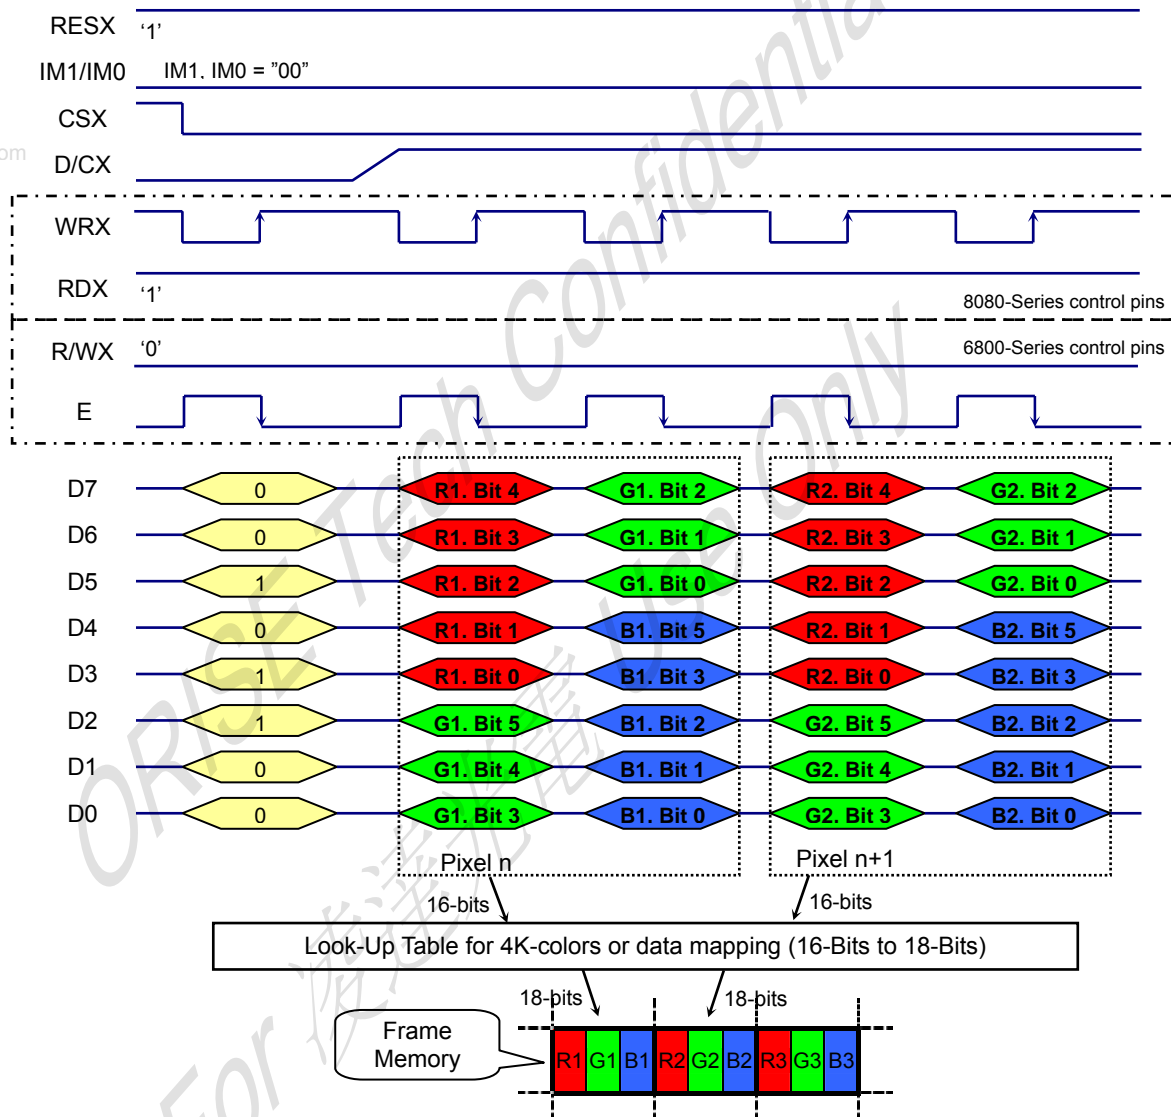

Note 1. The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 12-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

(2). 8-bits data bus for 16-bits/pixel (RGB 5-6-5-bits input), 65K-colours, 3AH="05h"

There are 1 pixels (3 sub-pixels) per 2-bytes.

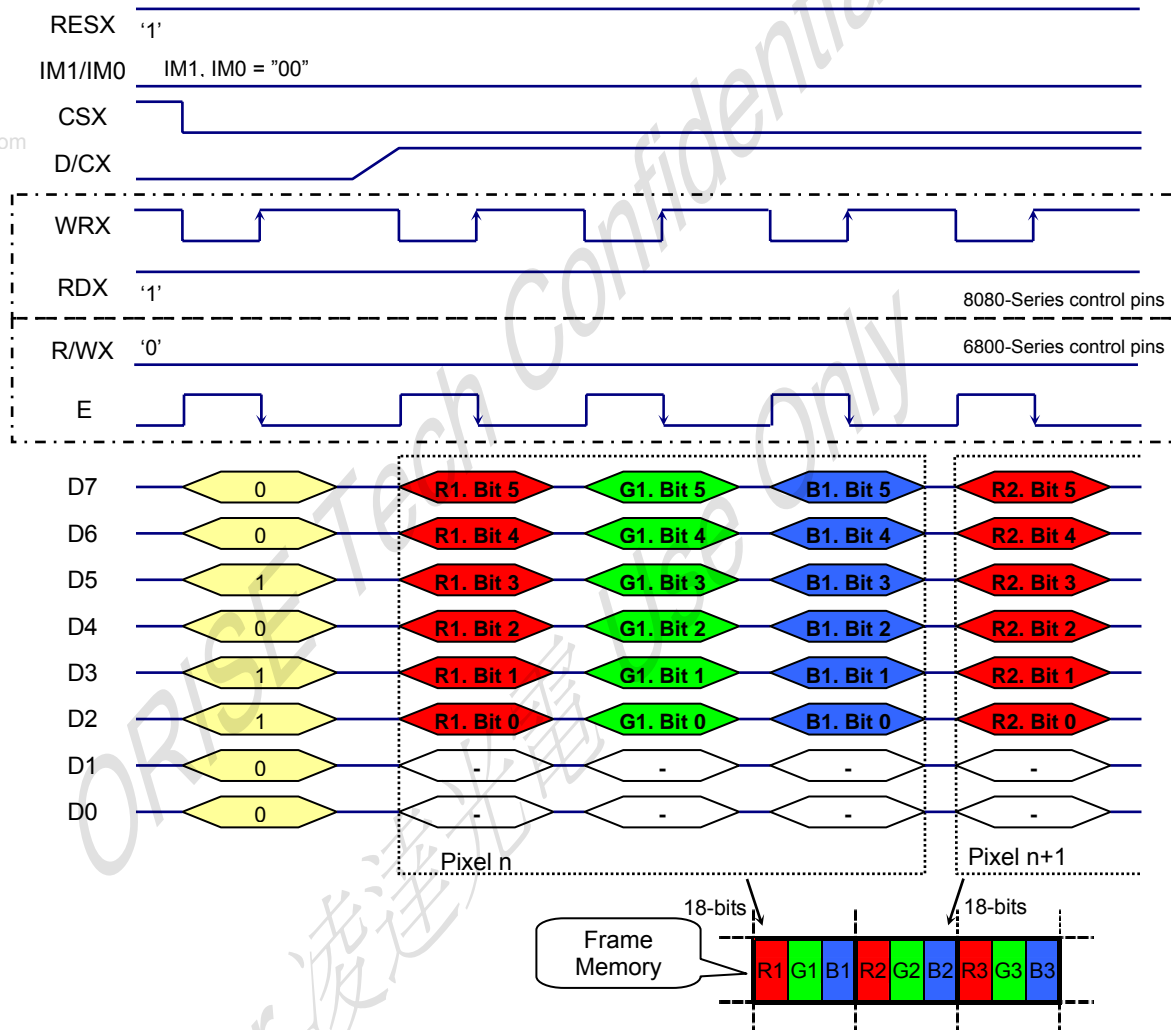

Note1. The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2. 2-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

(3). 8-bits data bus for 18-bits/pixel (RGB 6-6-6-bits input), 262K-colours, 3AH="06h"

There are 1 pixels (3 sub-pixels) per 3-bytes.

7.3.1.2. Parallel 16-Bits Bus Interface for RAM Data Write (IM1, IM0="01")

Different display data formats are available for three colors depth supported by listed below.

- 4K-Colours, RGB 4,4,4-bits input data. (3AH="03h")
- 65K-Colours, RGB 5,6,5-bits input data. (3AH="05h")
- 262K-Colours, RGB 6,6,6-bits input data. (3AH="06h")

(1). 16-bits data bus for 12-bits/pixel (RGB 4-4-4-bits input), 4K-colours, 3AH="03h"

There are 1 pixel (3 sub-pixels) per 1 bytes

Note 1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 12-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

(2). 16-bits data bus for 16-bits/pixel (RGB 5-6-5-bits input), 65K-colours, 3AH="05h"

There are 1 pixel (3 sub-pixels) per 1 bytes

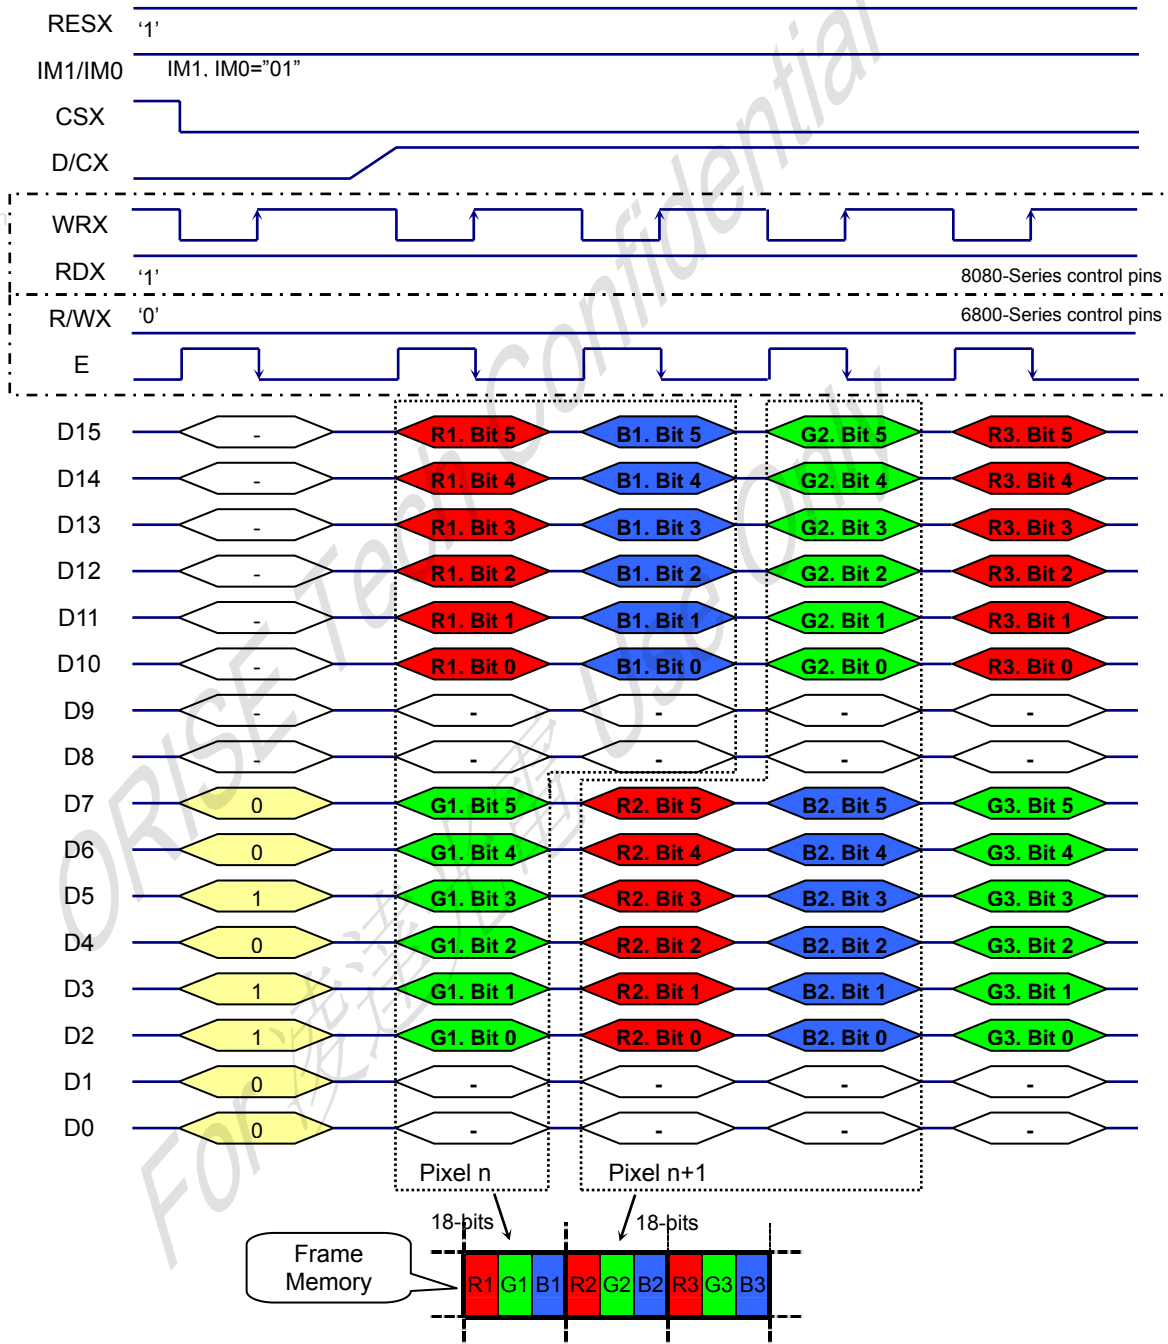

Note 1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

(3). 16-bits data bus for 18-bits/pixel (RGB 6-6-6-bits input), 262K-colours, 3AH="06h"

There are 2 pixel (6 sub-pixels) per 3 bytes

Note 1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

7.3.1.3. Parallel 9-Bits Bus Interface for RAM Data Write (IM1, IM0="10")

Different display data formats are available for three colors depth supported by listed below.

- 262K-Colours, RGB 6,6,6-bits input data. (3AH="06h")

(1). 9-bits data bus for 18-bits/pixel (RGB 6-6-6-bits input), 262K-colours, 3AH="06h"

There is 1 pixel (3 sub-pixels) per 2 bytes

Note 1. The data order is as follows, MSB=D8, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

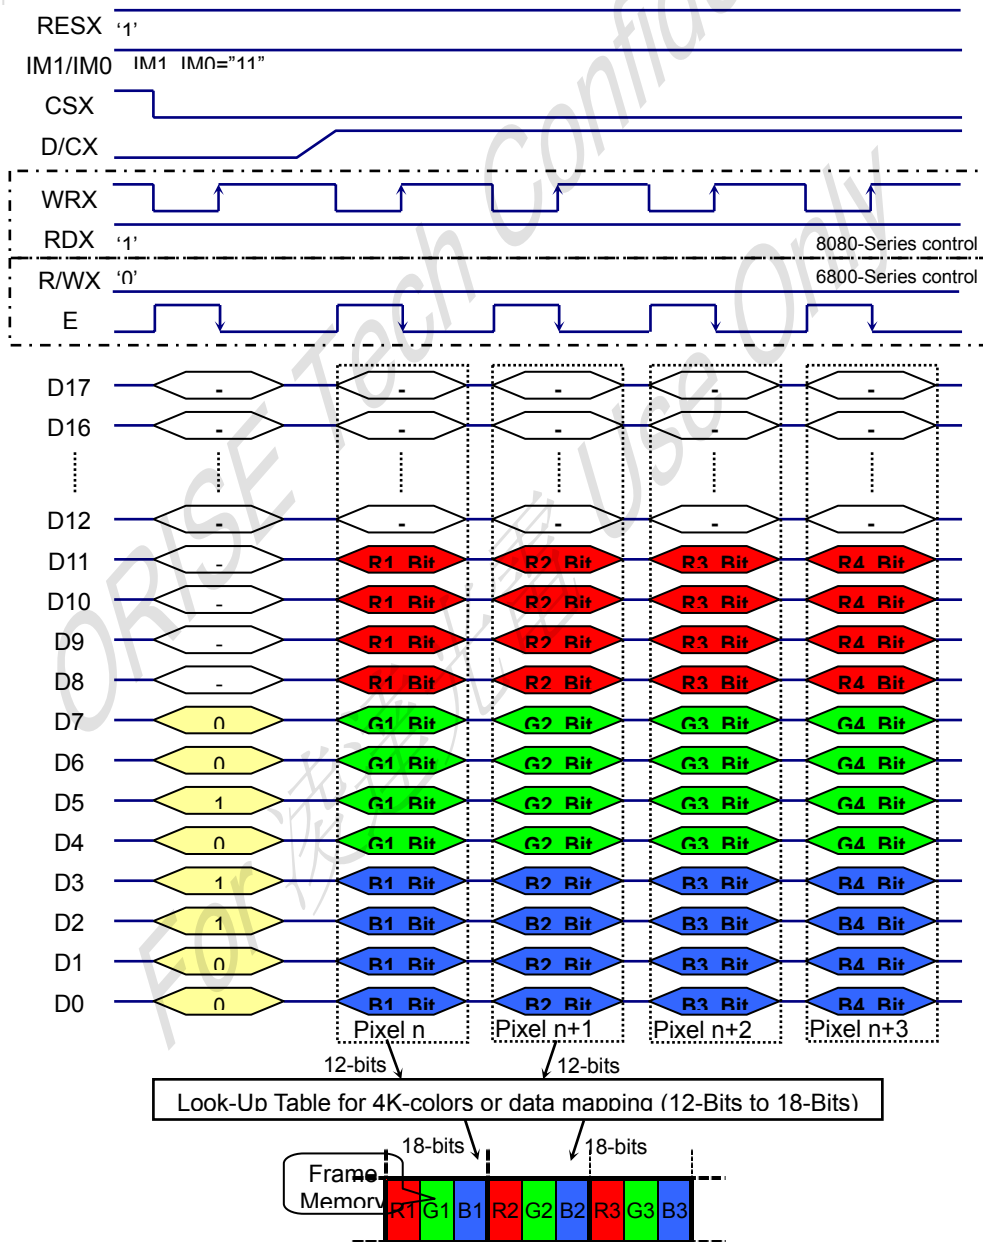

7.3.1.4. Parallel 18-Bits Bus Interface for RAM Data Write (IM1, IM0="11")

Different display data formats are available for three colors depth supported by listed below.

- 4K-Colours, RGB 4,4,4-bits input data. (3AH="03h")
- 65K-Colours, RGB 5,6,5-bits input data. (3AH="05h")
- 262K-Colours, RGB 6,6,6-bits input data. (3AH="06h")

(1). 18-bits data bus for 12-bits/pixel (RGB 4-4-4-bits input), 4K-colours, 3AH="03h"

There is 1 pixel (3 sub-pixels) per 1 bytes

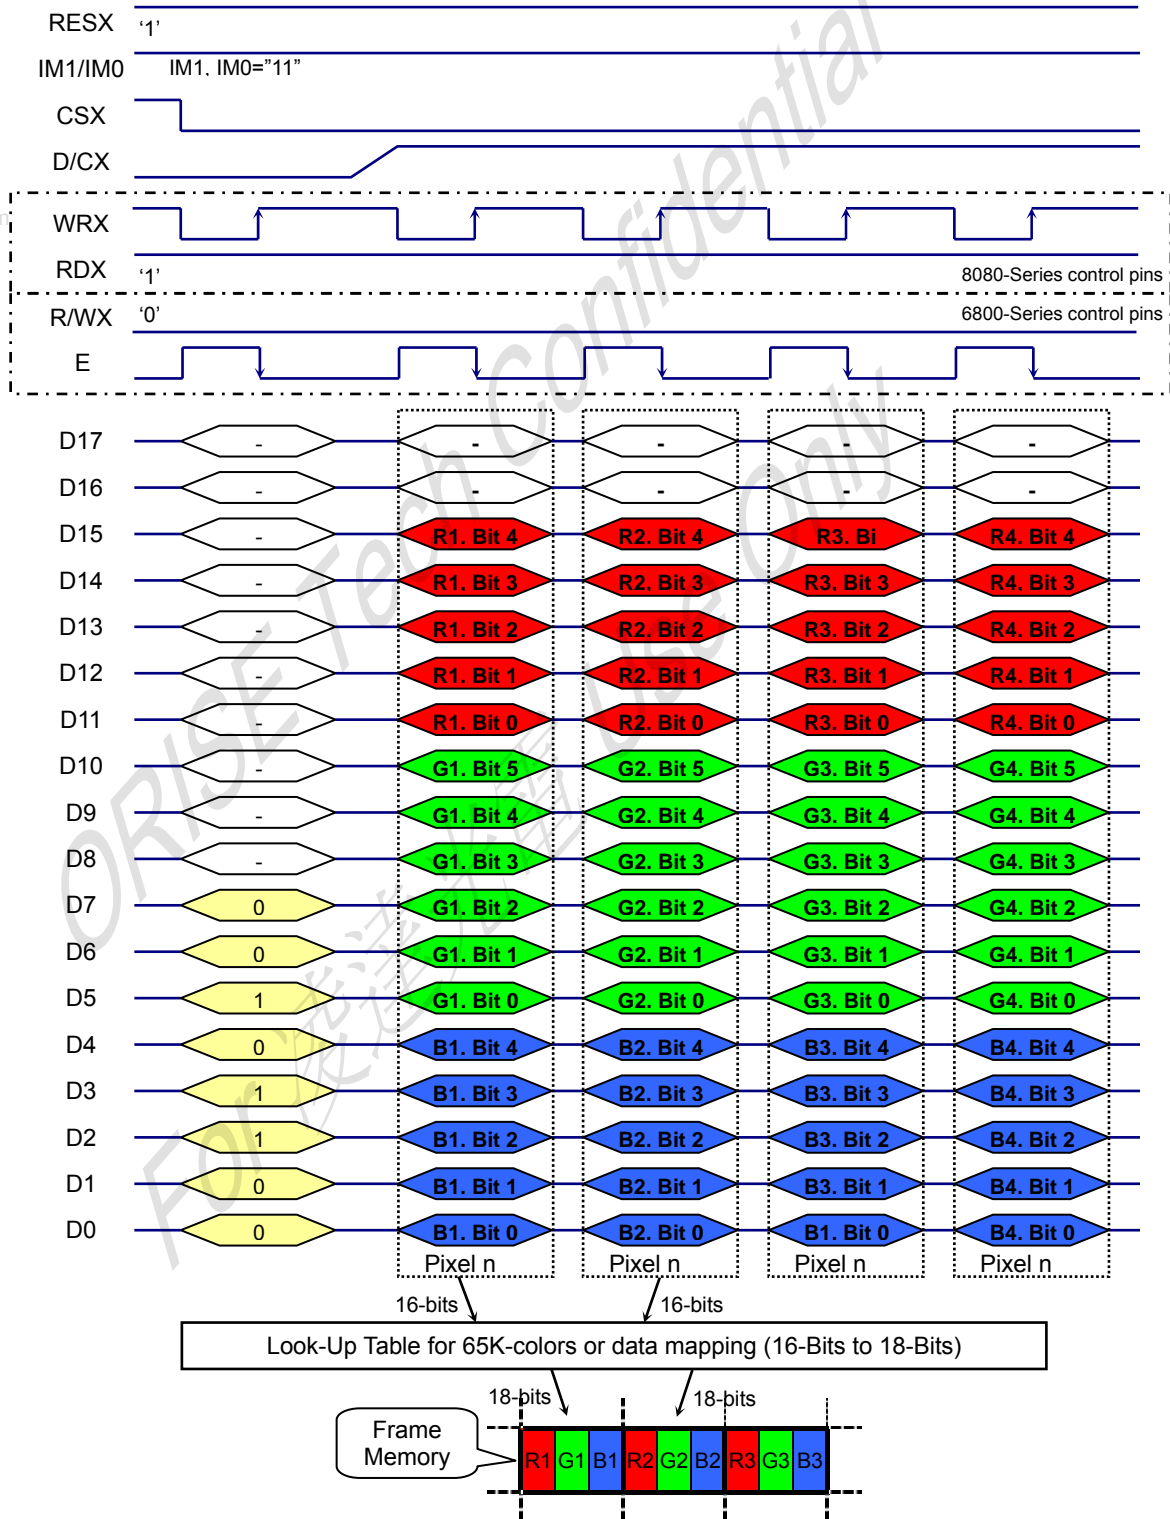

Note 1. The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 3, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 12-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

(2). 18-bits data bus for 16-bits/pixel (RGB 5-6-5-bits input), 65K-colours, 3AH="05h"

There are 1 pixel (3 sub-pixels) per 1 bytes

Note 1. The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Green, and MSB=Bit 4, LSB=Bit 0 for Red and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 16-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

(3). 18-bits data bus for 18-bits/pixel (RGB 6-6-6-bits input), 262K-colours, 3AH="06h"

There are 1 pixel (6 sub-pixels) per 1 bytes

Note1. The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

Note . 'x' Don't care, but need to set VDDI or DGND level.

7.3.2.1. Parallel 8-Bits Bus Interface for RAM Data Read (IM1, IM0= "00")

There are 1 pixels (3 sub-pixels) per 3-bytes. (RGB 6-6-6-bits output)

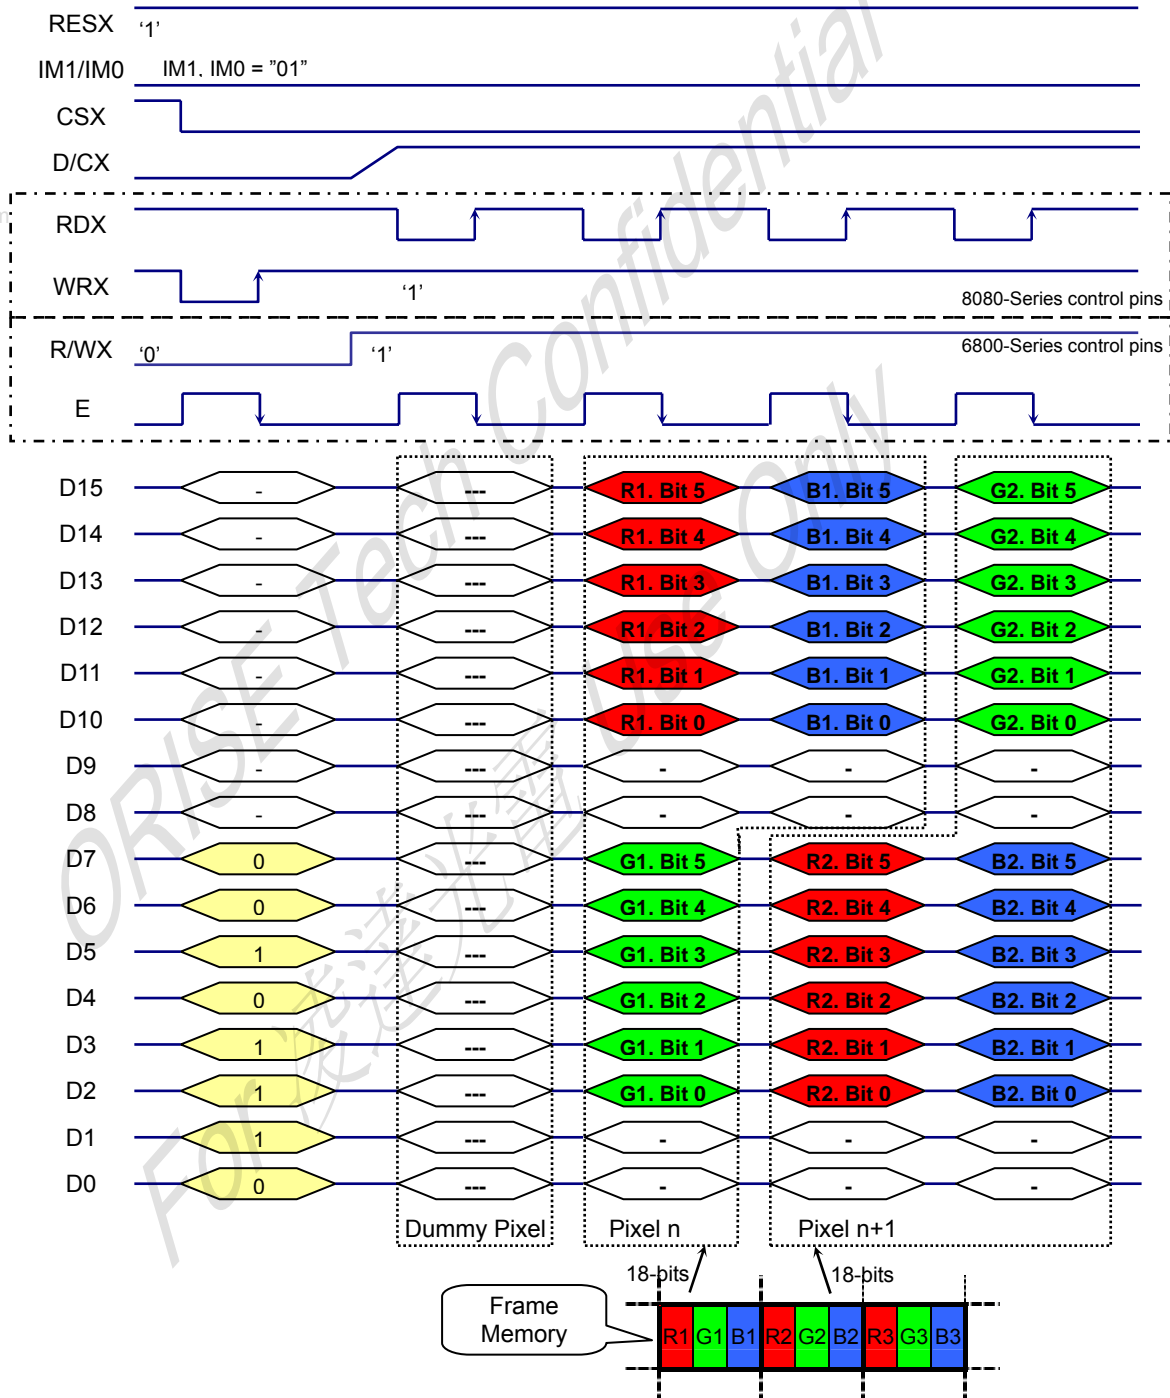

Note 1. The data order is as follows, MSB=D7, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

7.3.2.2. Parallel 16-Bits Bus Interface for RAM Data Read (IM1, IM0= "01")

There are 2 pixel (6 sub-pixels) per 3 bytes (RGB 6-6-6-bits output)

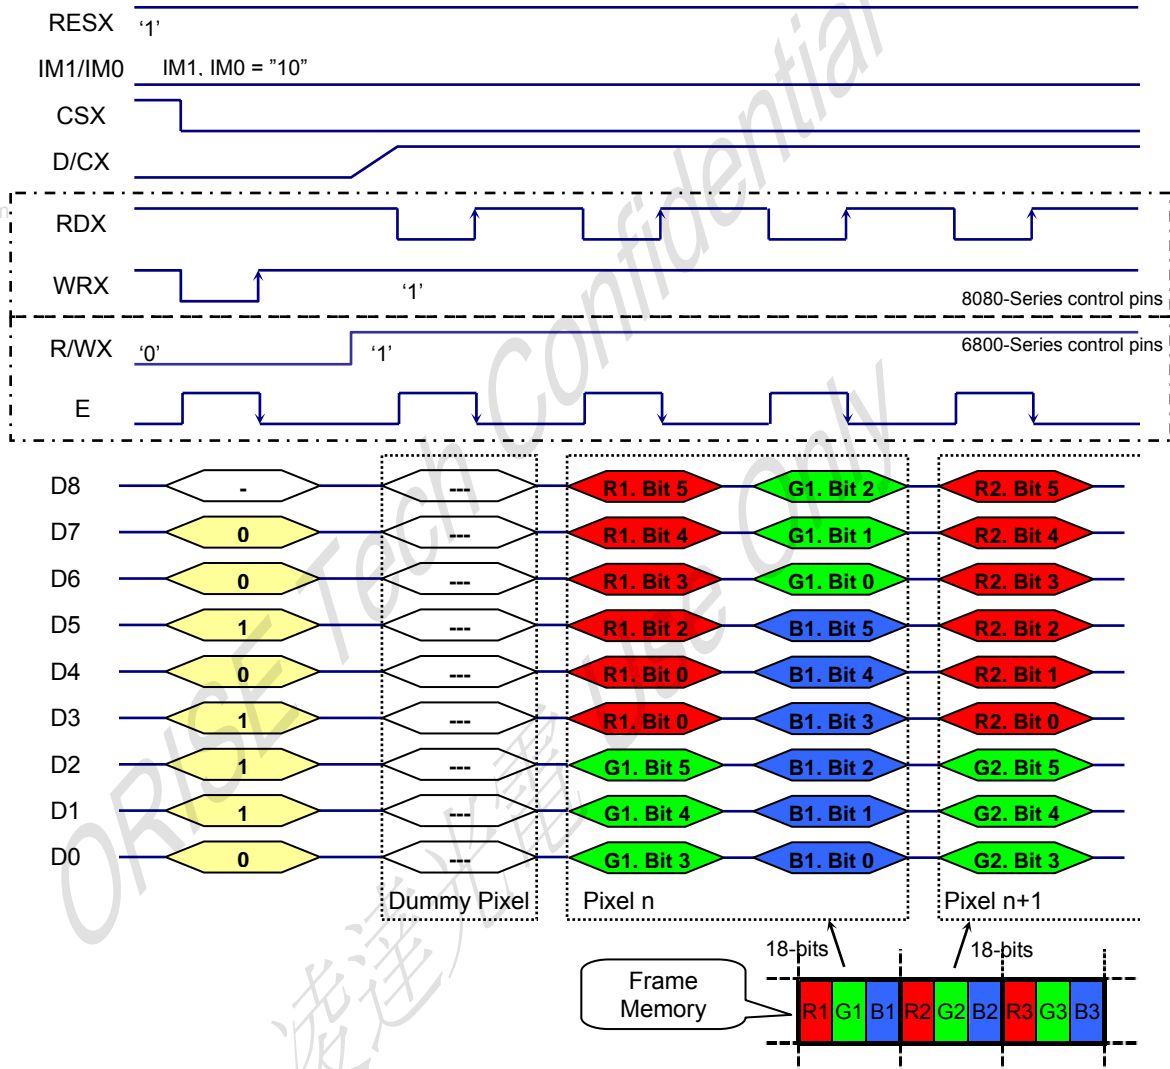

Note 1. The data order is as follows, MSB=D15, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

7.3.2.3. Parallel 9-Bits Bus Interface for RAM Data Read (IM1, IM0= "10")

There are 1 pixel (3 sub-pixels) per 2 bytes (RGB 6-6-6-bits output)

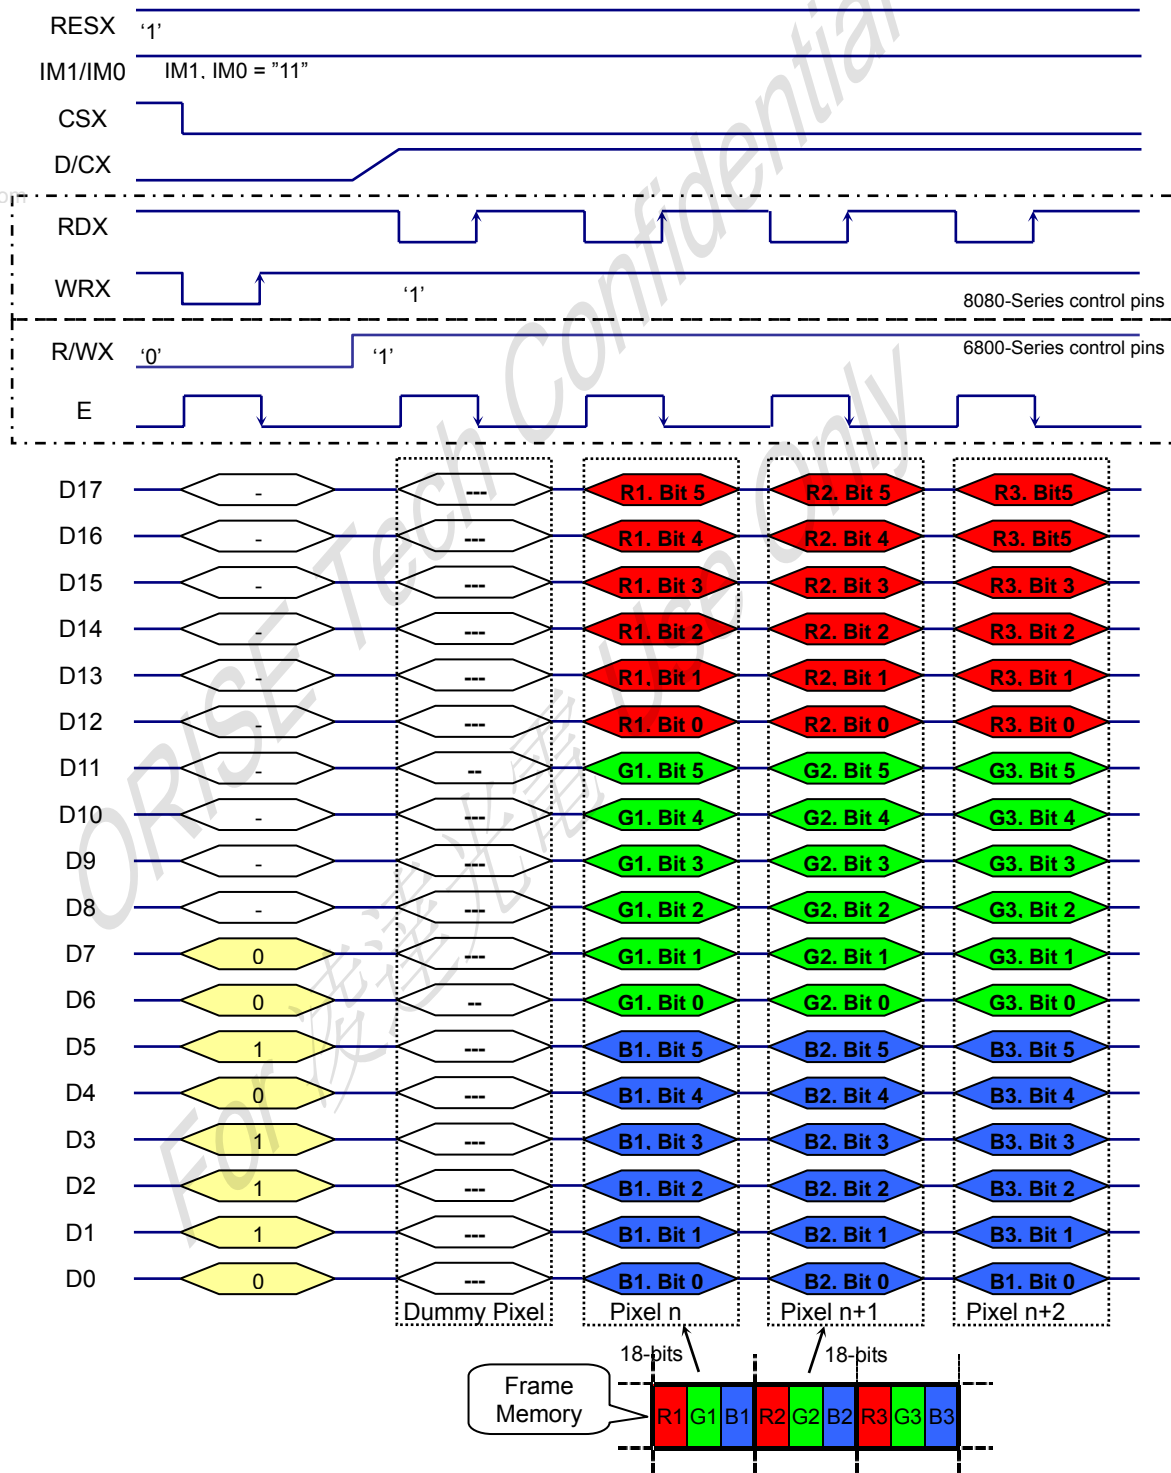

Note 1. The data order is as follows, MSB=D8, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 3-times transfer is used to transmit 1 pixel data with the 18-bit color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

7.3.2.4. Parallel 18-Bits Bus Interface for RAM Data Read (IM1, IM0= "11")

There are 1 pixel (3 sub-pixels) per 1 bytes (RGB 6-6-6-bits output)

Note 1. The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit 5, LSB=Bit 0 for Red, Green and Blue data.

Note 2. 1-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 3. '-' = Don't care - Can be set to VDDI or DGND level

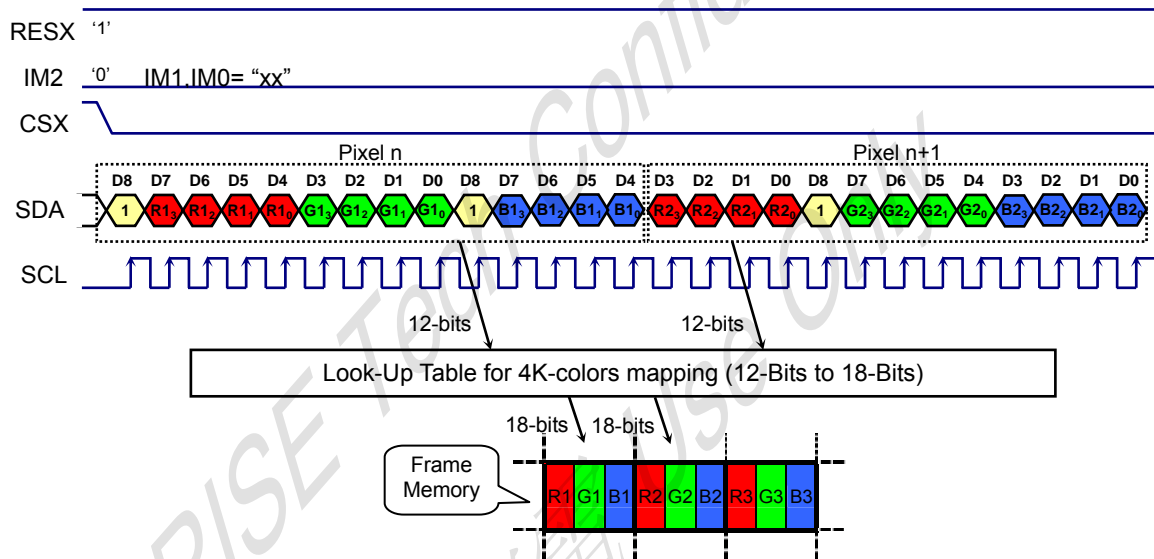

7.3.3. Serial Interface (IM2 = '0')

Different display data formats are available for three colors depth supported by the LCM listed below.

- 4K-Colours, RGB 4,4,4-bits input data. (3AH="03h")
- 65K-Colours, RGB 5,6,5-bits input data. (3AH="05h")
- 262K-Colours, RGB 6,6,6-bits input data. (3AH="06h")

7.3.3.1. Write data for 12-bits/pixel (RGB 4-4-4-bits input), 4K-colours, 3AH="03h"

www.DataSheet4U.com

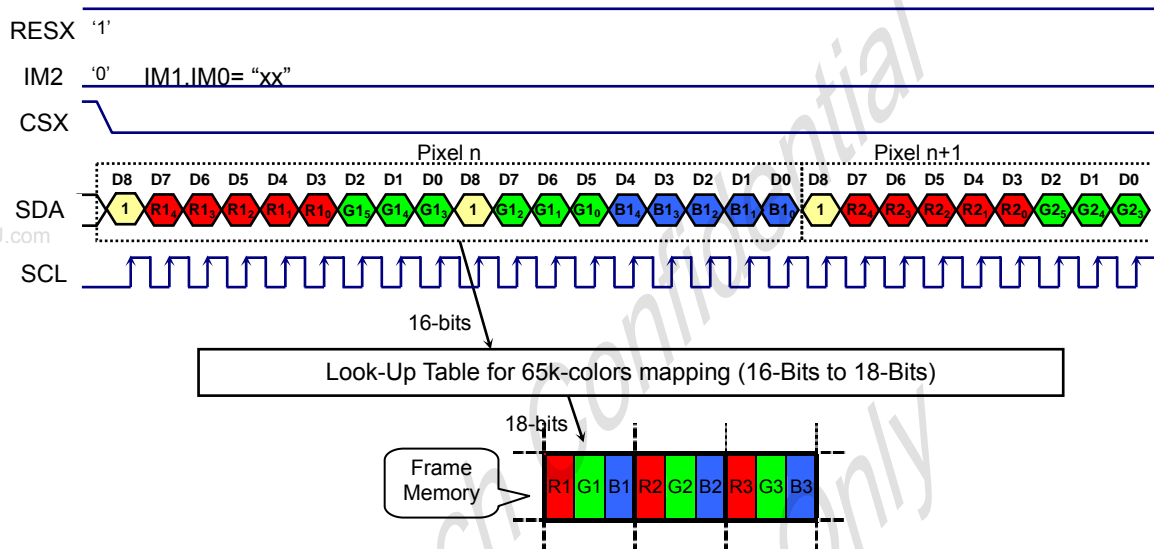

Note 1. pixel data with the 12-bits color depth information

Note 2. The most significant bits are: R_{x3}, G_{x3} and B_{x3}

Note 3. The least significant bits are: R_{x0}, G_{x0} and B_{x0}

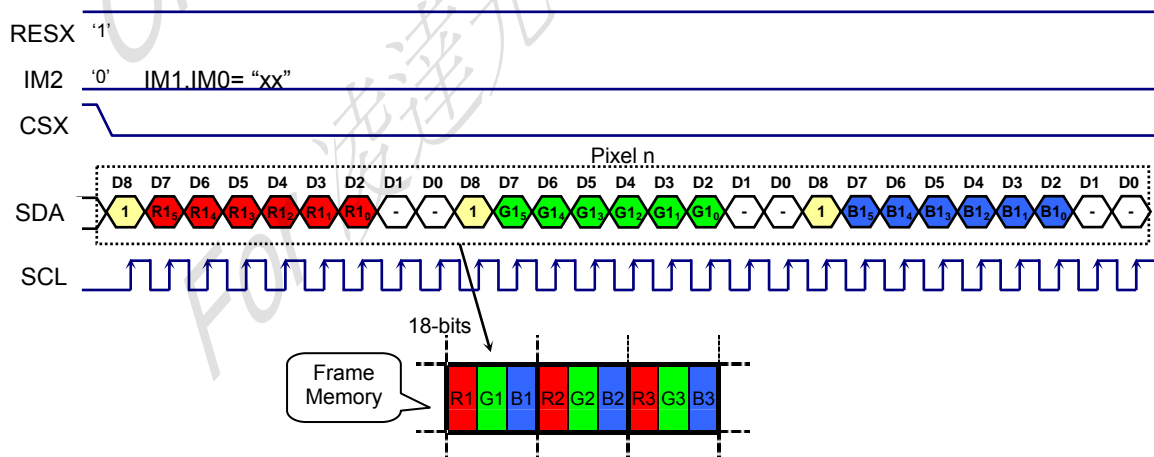

Note 4. '-' = Don't care - Can be set to VDDI or DGND level

7.3.3.2. Write data for 16-bits/pixel (RGB 5-6-5-bits input), 65K-colours, 3AH="05h"

- Note 1. pixel data with the 16-bits color depth information
- Note 2. The most significant bits are: Rx_4 , Gx_5 and Bx_4
- Note 3. The least significant bits are: Rx_0 , Gx_0 and Bx_0
- Note 4. '-' = Don't care - Can be set to VDDI or DGND level

7.3.3.3. Write data for 18-bits/pixel (RGB 6-6-6-bits input), 262K-colours, 3AH="06h"

- Note 1. pixel data with the 18-bits color depth information
- Note 2. The most significant bits are: Rx_5 , Gx_5 and Bx_5
- Note 3. The least significant bits are: Rx_0 , Gx_0 and Bx_0
- Note 4. '-' = Don't care - Can be set to VDDI or DGND level

7.3.3.4. Read data for Serial Interface (RGB 6-6-6-bits output)

Read Data format as below

Note: '-' = Don't care - Can be set to VDDI or DGND level

7.4. RGB interface

7.4.1. General Description

The module uses 6, 16 and 18-bits parallel RGB interface which includes: VS, HS, DE, PCLK, D[17:0]. The interface is activated after Power On sequence.

Pixel clock (PCLK) is running all the time without stopping and it is used to entering VS, HS, DE and D[17:0] states when there is a rising edge of the PCLK. The PCLK cannot be used as continuous internal clock for other functions of the display module e.g. Sleep In –mode etc.

Vertical synchronization (VS) is used to tell when there is received a new frame of the display. This is negative ('0', low) active and its state is read to the display module by a rising edge of the PCLK signal.

Horizontal synchronization (HS) is used to tell when there is received a new line of the frame. This is negative ('0', low) active and its state is read to the display module by a rising edge of the PCLK signal.

Data Enable (DE) is used to tell when there is received a RGB information that should be transferred on the display. This is a positive ('1', high) active and its state is read to the display module by a rising edge of the PCLK signal.

D[17:0] (18-bit: R5-R0, G5-G0 and B5-B0; 16-bit: R4-R0, G5-G0 and B4-B0) are used to tell what is the information of the image that is transferred on the display (When DE='1' and there is a rising edge of PCLK). D[17:0] can be '0' (low) or '1' (high). These lines are read by a rising edge of the PCLK signal.

The PCLK cycle is described in the following figure.

Fig. 7.4.1 PCLK cycle

Note: PCLK is an unsynchronized signal (It can be stopped).

7.4.2. General Timing Diagram

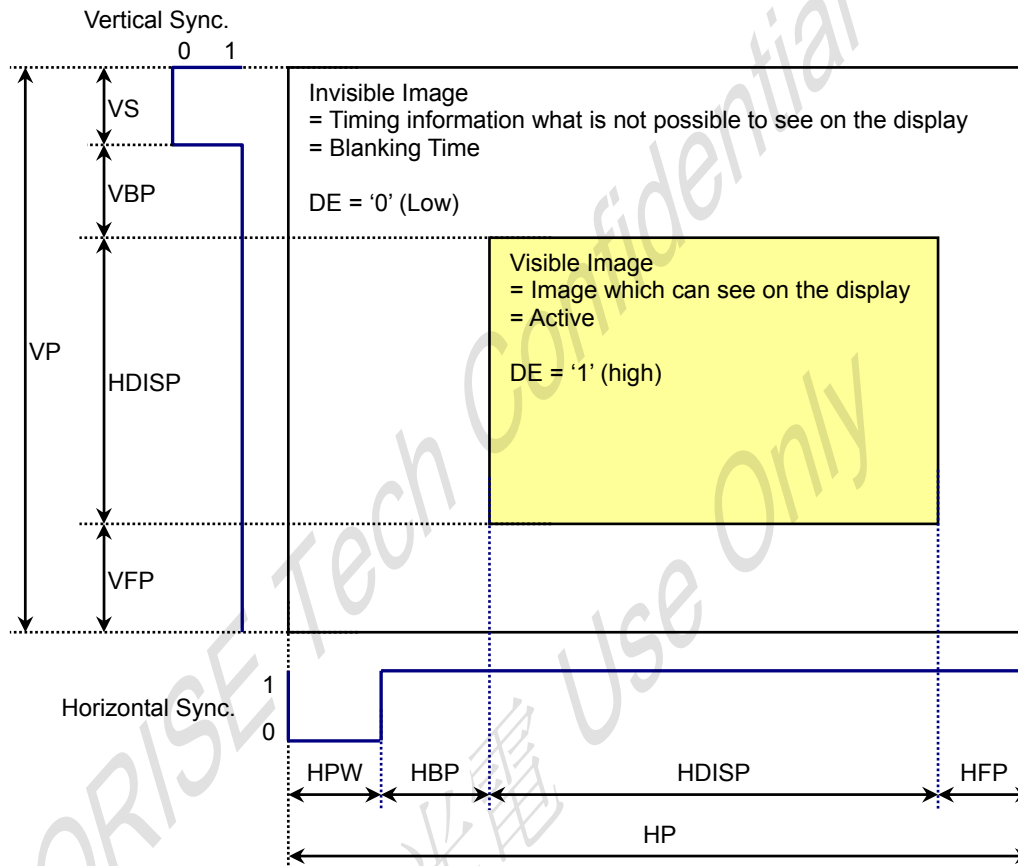

Fig. 7.4.2 RGB General Timing diagram

The image information must be correct on the display, when the timings are in range on the interface.

However, the image information can be incorrect on the display, when timings are not out of range on the interface (Out of the range timings cannot on the host side). The correct image information must be displayed automatically (by the display module) on the next frame (vertical sync.) when there is returned from out of the range to in range interface timing.

7.4.3. Updating Order on Display Active Area (Normal Display Mode On + Sleep Out)

There is defined different kind of updating orders for display. These updating orders are controlled by H/W (SMX, SMY) and S/W (MX, MY,) bits.

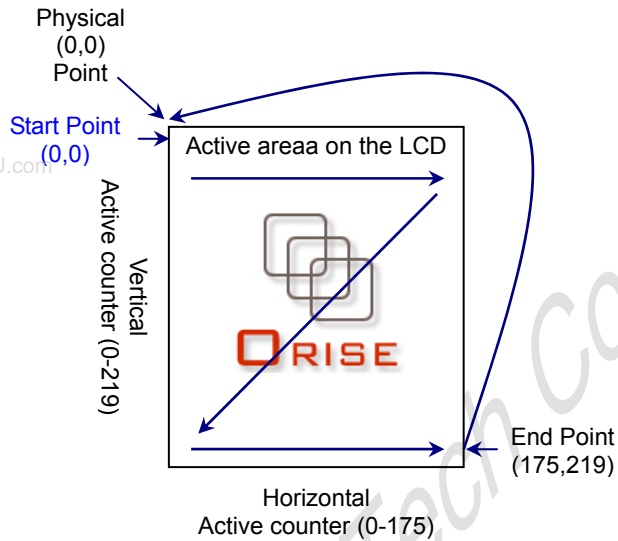

Fig. 7.4.3.1 Updating order when MADCTL's MX='0' and MY = '0'

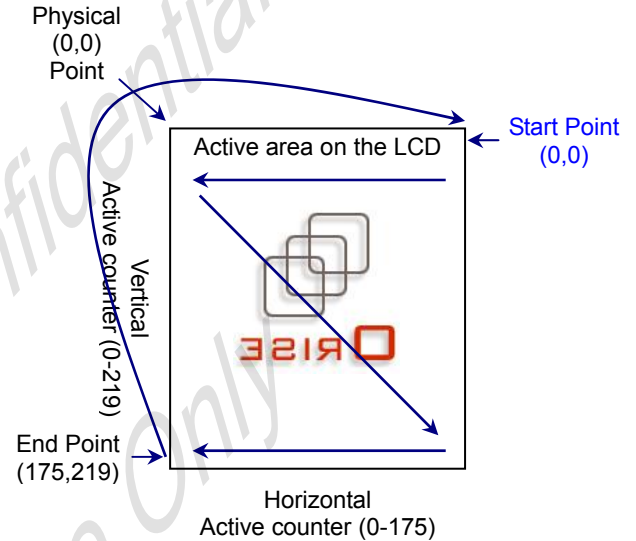

Fig. 7.4.3.2 Updating order when MADCTL's MX='1' and MY = '0'

Fig. 7.4.3.3 Updating order when MADCTL's MX='0' and MY = '1'

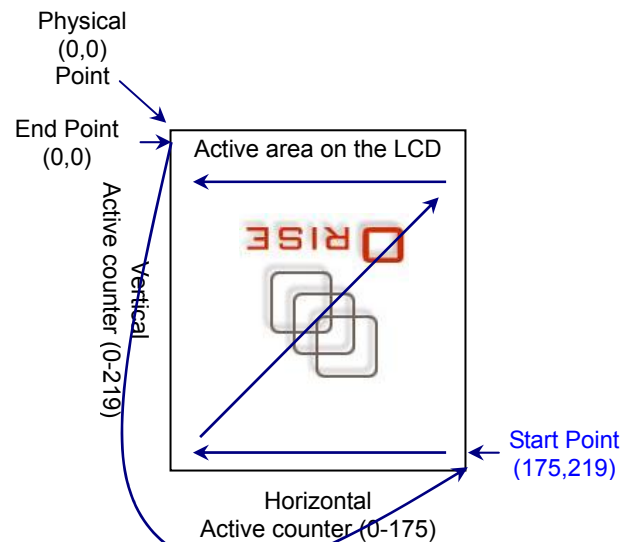

Fig. 7.4.3.4 Updating order when MADCTL's MX='1' and MY = '1'

Table 7.4.3.1 Rules for Updating Order

Condition	Horizontal Counter	Vertical Counter
An active VS signal is received	Return to 0	Return to 0
Signal Pixel information of the active area is received	Increment by 1	No change
An active HS signal between two active area lines	Return to 0	Increment by 1
The Horizontal counter is larger than 127 and the Vertical counter is larger than 159	Return to 0	Return to 0

Note 1. Pixel order is RGB on the display.

Note 2. Data streaming direction from the host to the display is described in the following figure.

www.DataSheet4U.com

Data Stream from RGB I/F is like in this figure

Fig. 7.4.3.5 Data streaming order from RGB I/F

7.4.4. RGB Interface Bus Width set

All 4-kinds of bus width can be available during RGB interface mode (selected by COLMOD (3Ah) command for 8-bits, 16-bits and 18-bits data width)

Table 7.4.4.1 RGB interface Bus Width Set Table

VIPF[3:0]	D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Bus width
0101	R4	R3	R2	R1	R0	x	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0	x	16-bits data
0110	R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0	18-bits data
VIPF[3:0]	D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Bus width
1110	x	x	x	x	x	x	x	x	x	x	R5	R4	R3	R2	R1	R0	x	x	6-bits data
	x	x	x	x	x	x	x	x	x	x	G5	G4	G3	G2	G1	G0	x	x	
	x	x	x	x	x	x	x	x	x	x	B5	B4	B3	B2	B1	B0	x	x	

Note 1: When VIPF[3:0]=“1110”, 6-bits data width of 3-times transfer is used to transmit 1 pixel data with the 18-bits color depth information.

Note 2: Only VIPF[3:0]= “0101”, “0110” and “1110” are valid on RGB I/F, Others are invalid.

Note 3: ‘x’ Don’t care, but need to set VDDI or DGND level.

7.4.5. RGB Interface Mode Set

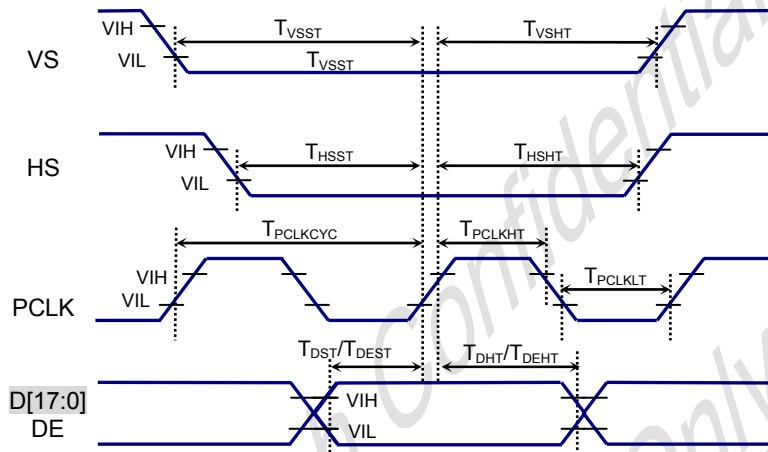

Table 7.4.5.1 RGB Interface Mode Set

RGB I/F Mode	PCLK	DE	VS	HS	Video Data bus D[17:0]	Register for Blanking Porch setting	Reference clock for Display
RGB Mode 1	Used	Used	Used	Used	Used	Not Used	Internal Oscillator
RGB Mode 2	Used	Used	Used	Used	Used	Used	Internal Oscillator

There are 2-kinds of RGB mode which is selected by RCM1 & RCM0 hardware pins.

In RGB Mode 1 (RCM1, RCM0 = “10”), writing data to frame memory is done by PCLK and Video Data Bus (D[17:0]), when DE is high state. The external synchronization signals (PCLK, VS and HS) are used for internal display signals. So, controller (host) must always transfer PCLK, VS, HS and DE signals to SPFD54126B.

In RGB Mode 2 (RCM1, RCM0 = “11”), blanking porch setting of VS and HS signals are defined by RGBBPCTR (B5h) command. When DE pin is high, valid data is directly stored to frame memory.

7.4.6. RGB Interface Timing Diagram
7.4.6.1. General Timings for RGB I/F

Fig. 7.4.6.1.1 General Timing for RGB I/F
Table 7.4.6.1.1 General Timing for RGB I/F

Item	Symbol	Condition	Specification			Unit
			Min	Type.	Max	
Pixel low pulse width	T_{PCLKLT}		15			
Pixel high pulse width	T_{PCLKHT}		15			
Vertical Sync. set-up time	T_{VSST}		15			ns
Vertical Sync. hold time	T_{VSHT}		15			ns
Horizontal Sync. set-up time	T_{HSST}		15			ns
Horizontal Sync. hold time	T_{DSST}		15			ns
Data Enable set-up time	T_{DST}		15			
Data Enable hold time	T_{DEHT}		15			
Data set-up time	T_{DST}		15			
Data hold time	T_{DHT}		15			

Note 1: $V_{DDI}=1.6$ to $3.6V$, $V_{DD}=2.6$ to $3.5V$, $AGND=DGND=0V$, $T_a=-30$ to $70^{\circ}C$ (to $+85^{\circ}C$ no damage)

Note 2: The input signal rise time and fall time (t_r , t_f) is specified at 15 ns or less.

Note 3: Data lines can be set to "High" or "Low" during blanking time – Don't care.

Note 4: Logic high and low levels are specified as 30% and 70% of V_{DDI} for Input signals.

Note 1. VDD1=1.6 to 3.6V, VDD=2.6 to 3.5V, AGND=DGND=0V, Ta=-30 to 70°C (to +85°C no damage)

Note 2. Data lines can be set to "High" or "Low" during blanking time – Don't care.

7.4.6.4. Power On Sequence on RGB Mode 2

The Driver operates power up and display ON by VDD, VDDI, SHUT, VS, HS, DE, PCLK on RGB mode 2 as show as following figure.

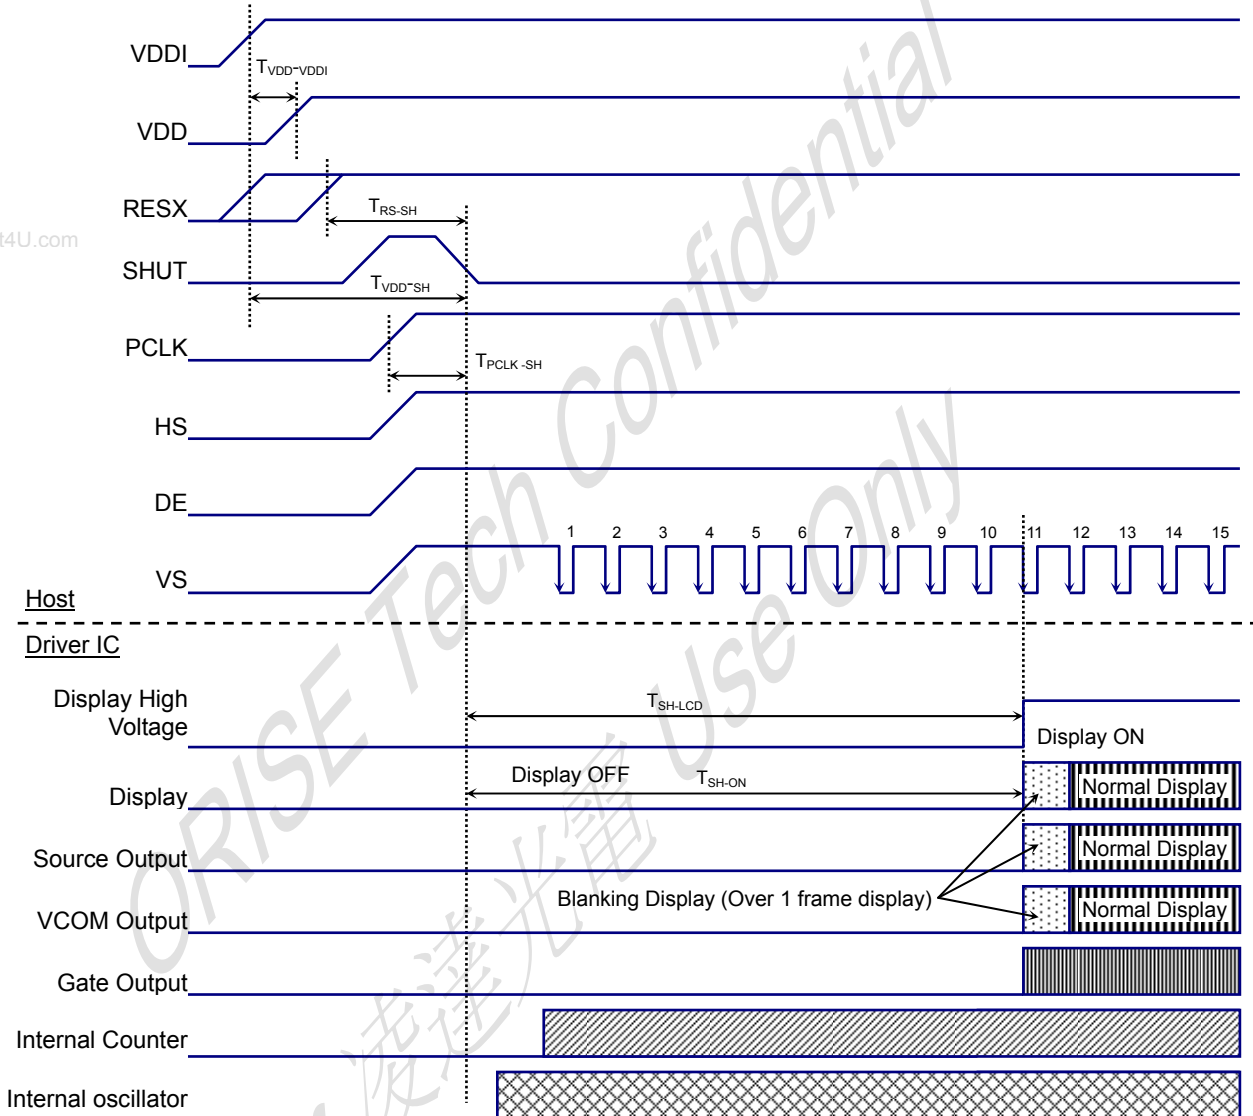

Fig. 7.4.6.4.1 Power On Sequence on RGB Mode 2

Table 7.4.6.4.1 Power ON AC Characteristics

Characteristics	Symbol	Min	Typ	Max	Unit	Remark
VDDI On to VDD On	$T_{VDDI-VDD}$	0			ns	Note1
VDDI/VDD on to falling edge of SHUT	T_{VDD-SH}	1			ms	
RESX to falling of SHUT	T_{RS-SH}	10			us	
Signals input to falling edge of SHUT *	T_{CLK-SH}	1			PCLK	Note2
Falling edge of SHUT to LCD power ON	T_{SH-LCD}			120	ms	
Falling edge of SHUT to Display start	T_{SH-ON}		10		VS	

Note 1: $T_{VDDI-VDD}$ can be $\leq 0ns$, $> 0ns$. In any case, VDDI and VDD power up sequence should not have any impact on the driver / display functionalities / performance.

Note 2: Signals mean VS, HS, DE and PCLK signal.

Note 3: DP='0', EP='0', HSP='0' and VSP='0' of RGBCTR (B0h) command.

7.4.6.5. Power OFF Sequence on RGB Mode 2

The Driver operates power off and display OFF by VDD, VDDI, SHUT, VS, HS and DE on RGB mode 2 as show as following figure.

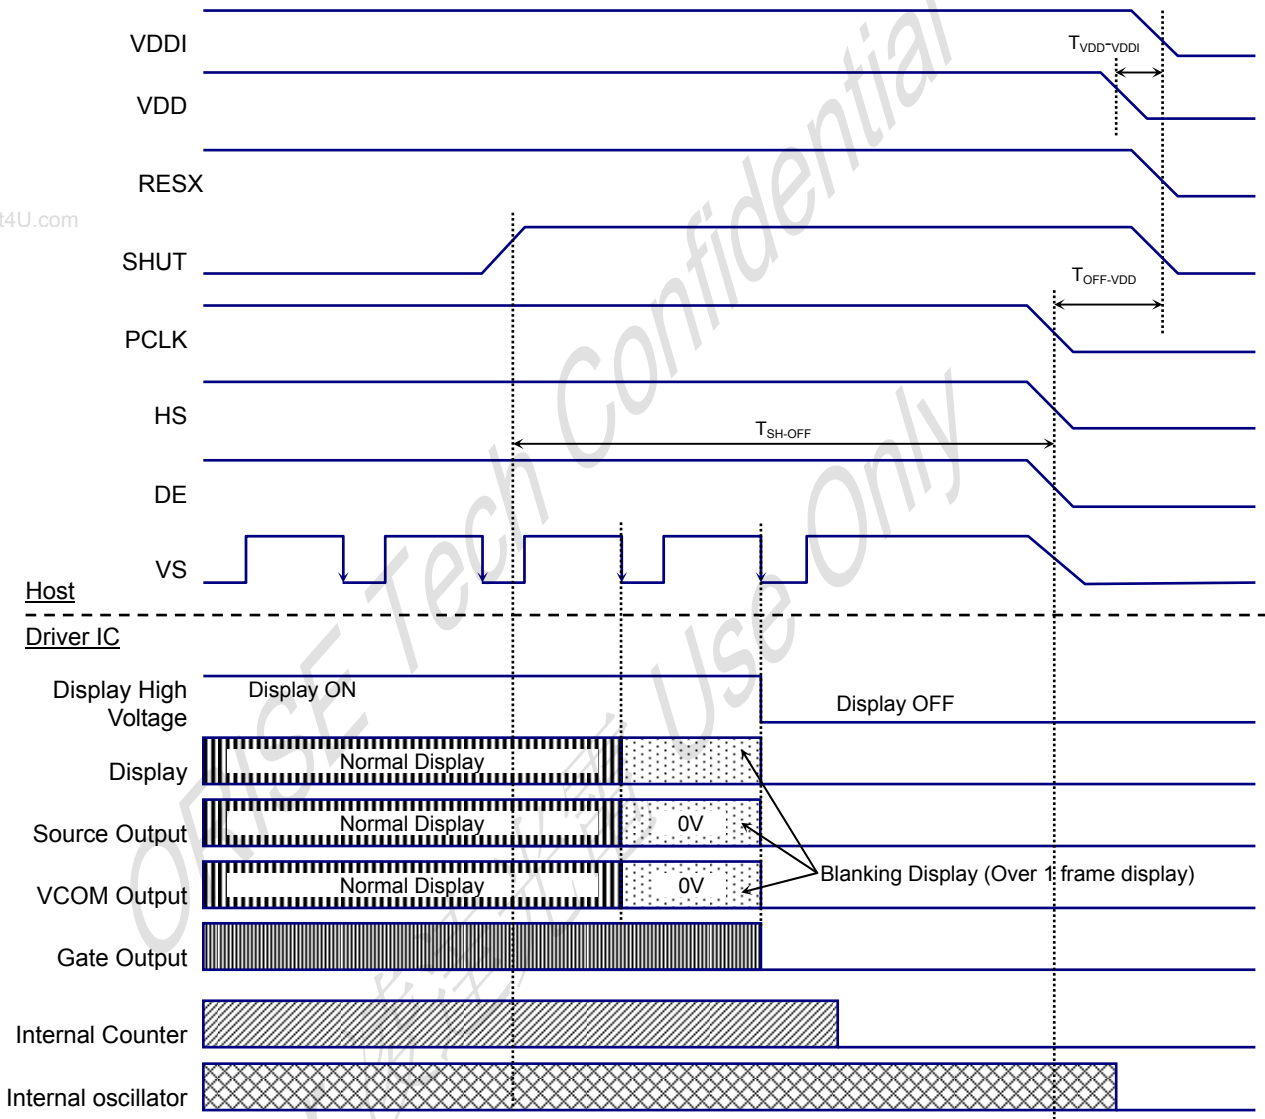

Fig. 7.4.6.5.1 Power OFF Sequence on RGB Mode 2

Table 7.4.6.5.1 Power OFF AC Characteristics

Characteristics	Symbol	Min	Typ	Max	Unit	Remark
VDDI On to VDD On	$T_{VDDI-VDD}$	0			ns	Note1
Signals input to VDDI/VDD off	$T_{off-VDD}$	1			us	Note2
Rising edge of SHUT to Display off	T_{SH-OFF}	2			VS	

Note 1: $T_{VDDI-VDD}$ can be $\leq 0ns$, $>0ns$. In any case, VDDI and VDD power up sequence should not have any impact on the driver / display functionalities / performance.

Note 2: Signals mean VS, HS, DE and PCLK signal.

Note 3: DP='0', EP='0', HSP='0' and VSP='0' of RGBCTR (B0h) command.

7.4.7. RGB Data Color Coding

7.4.7.1. 16-bits/pixel Colour Order on the RGB Interface

Note 1: The data order is as follows, MSB=D23, LSB=D0 and picture data is MSB=Bit5, LSB=Bit0 for Green data and MSB=Bit4, LSB=Bit0 for Red and Blue data.

Note 2: '-' Don't care, but need set to VDDI or DGND level.

7.4.7.2. 18-bits/pixel Colour Order on the RGB Interface

Note 1: The data order is as follows, MSB=D23, LSB=D0 and picture data is MSB=Bit5, LSB=Bit0 for Red, Green and Blue data.

Note 2: '-' Don't care, but need set to VDD1 or DGND level.

7.4.7.3. 6-bits/pixel Colour Order on the RGB Interface

Note 1: The data order is as follows, MSB=D17, LSB=D0 and picture data is MSB=Bit5, LSB=Bit0 for Red, Green and Blue data.

Note 2: '-' Don't care, but need set to VDDI or DGND level.

7.5. Display Data RAM

7.5.1. Configuration

The display module has an integrated 176x220x18-bit graphic type static RAM. This 696,960-bits memory allows to store on-chip a 176xRGBx220 image with an 18-bpp resolution (262K-color).

There will be no abnormal visible effect on the display when there is a simultaneous Panel Read and interface Read or Write to the same location of the Frame Memory.

Display Data RAM Organization (GM='00')

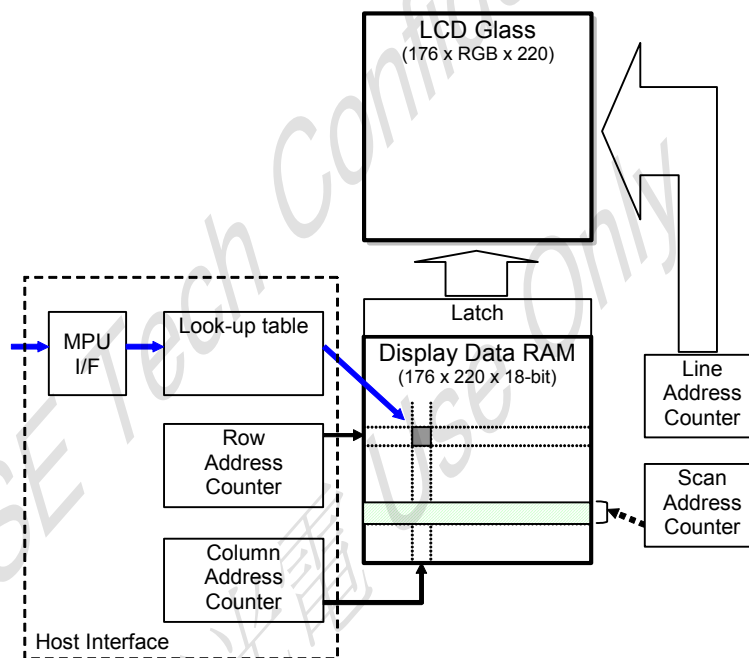

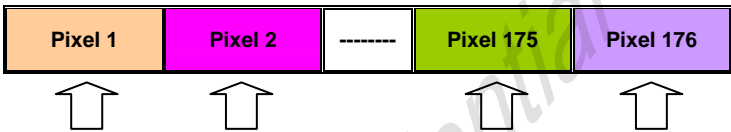

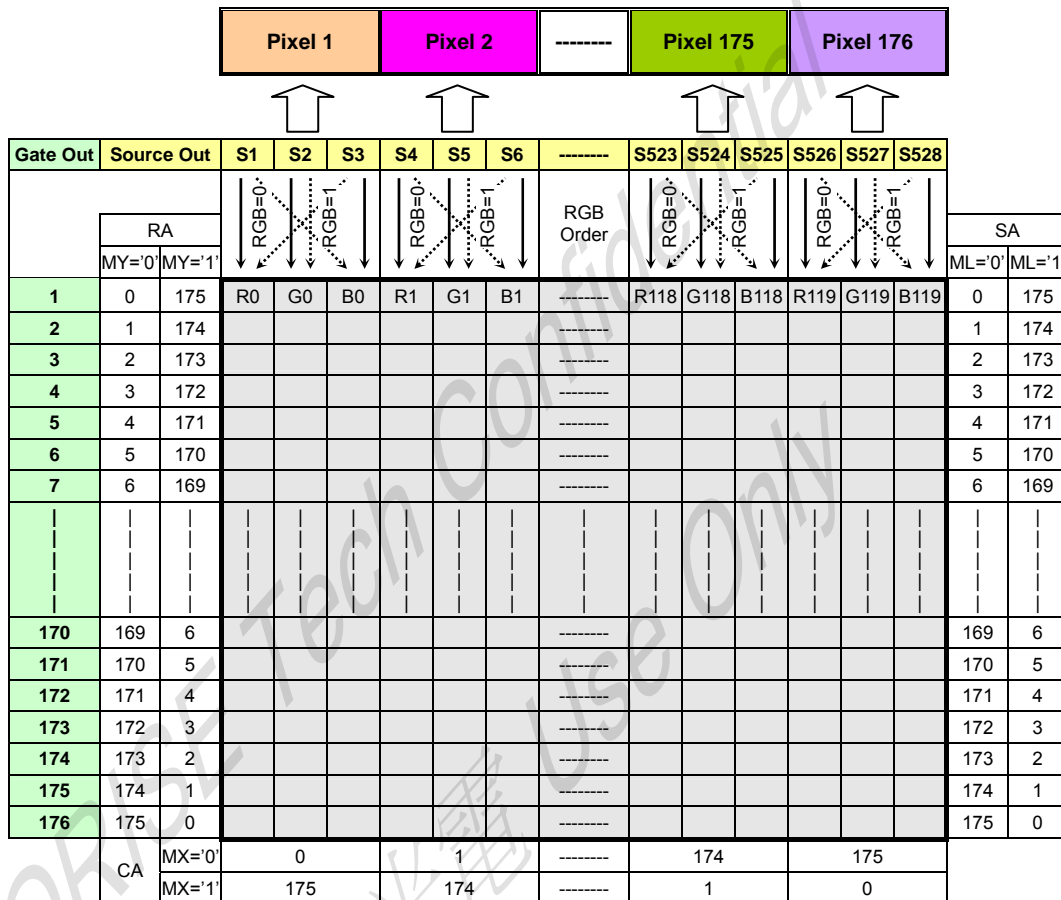

Fig. 7.5.1.1 Display Date RAM Organization

7.5.2. Memory to Display Address Mapping
7.5.2.1. When using 176RGB x 220 resolution (GM1, GM0 = "00", SMX=SMY=SRGB='0')

Gate Out	Source Out		S1	S2	S3	S4	S5	S6	-----	S523	S524	S525	S526	S527	S528	SA

220	219	0							-----							219	0		
CA	MX='0'		0			1			-----	174			175						
	MX='1'		175			174			-----	1			0						

Note
RA = Row Address,
CA = Column Address
SA = Scan Address
MX = Mirror X-axis (Column address direction parameter), D6 parameter of MADCTL command
MY = Mirror Y-axis (Column address direction parameter), D7 parameter of MADCTL command
MX = Scan direction parameter, D4 parameter of MADCTL command
RGB = Red, Green and Blue pixel position change, D3 parameter of MADCTL command

7.5.2.2. When using 176RGB x 176 resolution (GM1, GM0 = "01", SMX=SMY=SRGB='0')

Note

RA = Row Address,

CA = Column Address

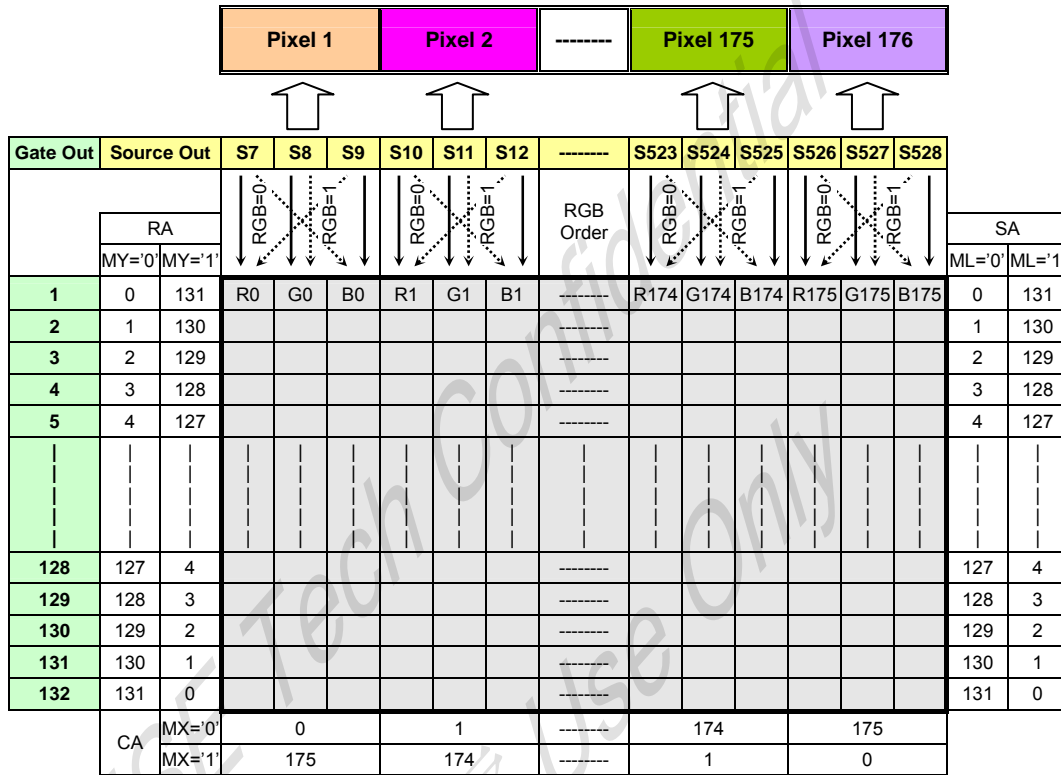

SA = Scan Address

MX = Mirror X-axis (Column address direction parameter), D6 parameter of MADCTL command

MY = Mirror Y-axis (Column address direction parameter), D7 parameter of MADCTL command

MX = Scan direction parameter, D4 parameter of MADCTL command

RGB = Red, Green and Blue pixel position change, D3 parameter of MADCTL command

7.5.2.3. When using 176RGB x 132 resolution (GM1, GM0 = "11", SMX=SMY=SRGB='0')

Note

RA = Row Address,

CA = Column Address

SA = Scan Address

MX = Mirror X-axis (Column address direction parameter), D6 parameter of MADCTL command

MY = Mirror Y-axis (Column address direction parameter), D7 parameter of MADCTL command

MX = Scan direction parameter, D4 parameter of MADCTL command

RGB = Red, Green and Blue pixel position change, D3 parameter of MADCTL command

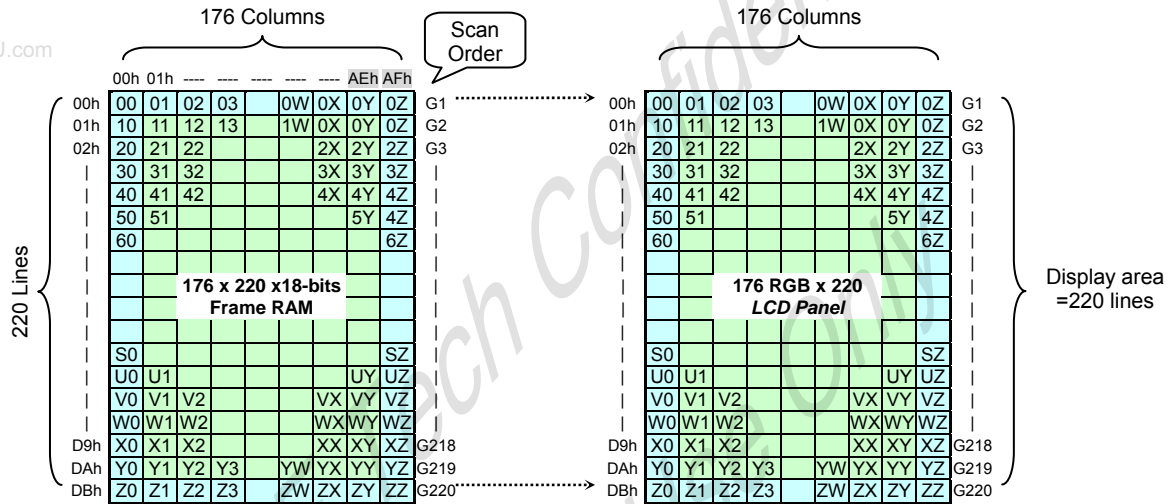

7.5.3. Normal Display On or Partial Mode On, Vertical Scroll Off

7.5.3.1. When using 176RGB x 220 resolution (GM1, GM0 = "00")

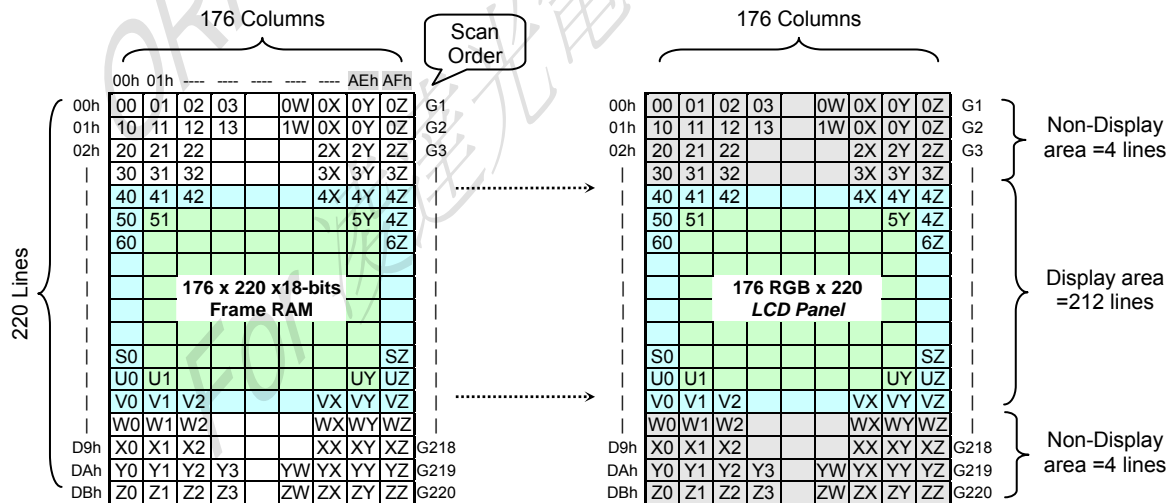

In this mode, content of the frame memory within an area where column pointer is 00h to AFh and page pointer is 00h to DBh is displayed.

To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

(1) Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

(2). Example for Partial Display On (PSL[7:0]=04h, PEL[7:0]=D7h, MX=MV=ML='0', SMX=SMY='0')

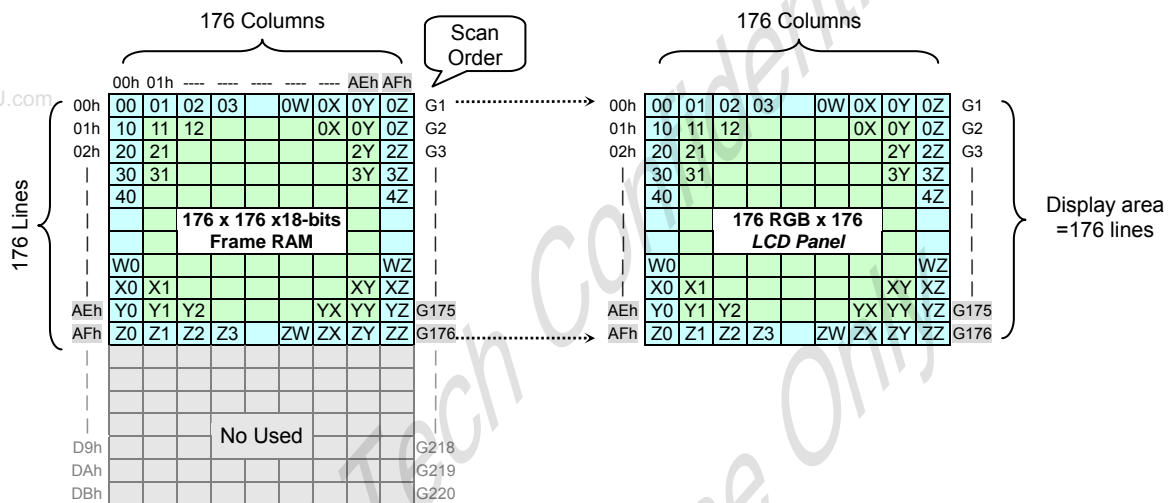

7.5.3.2. When using 176RGB x 176 resolution (GM1, GM0 = "01")

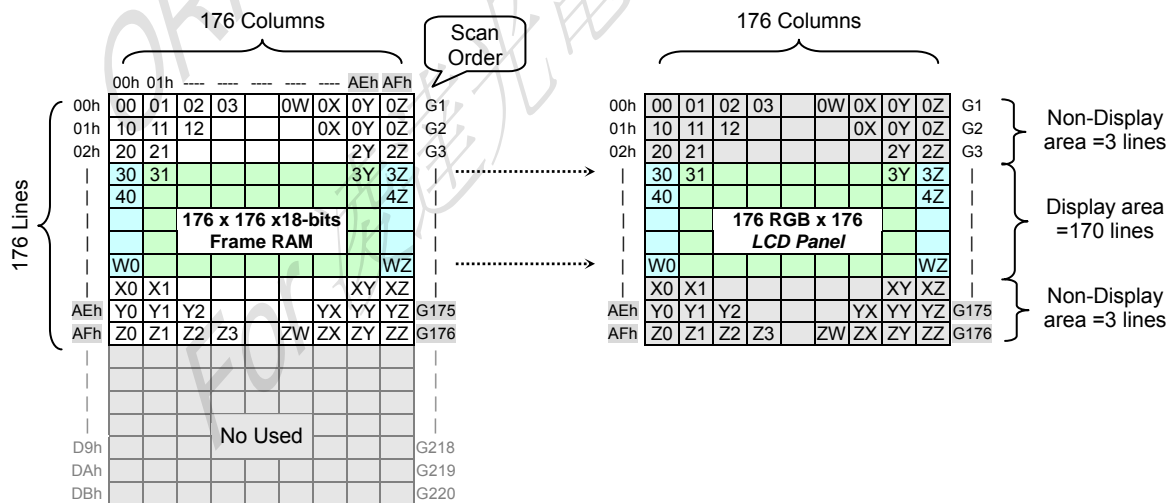

In this mode, contents of the frame memory within an area where column pointer is 00h to AFh and page pointer is 00h to AFh is displayed.

To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

(1) Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

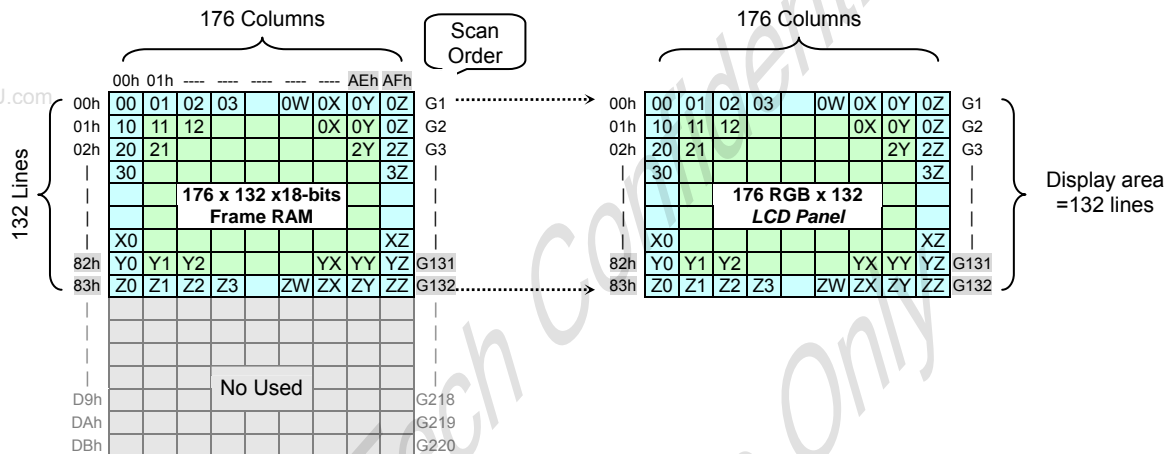

(2) Example for Partial Display On (PSL[7:0]=03h, PEL[7:0]=ACh, MX=MV=ML='0', SMX=SMY='0')

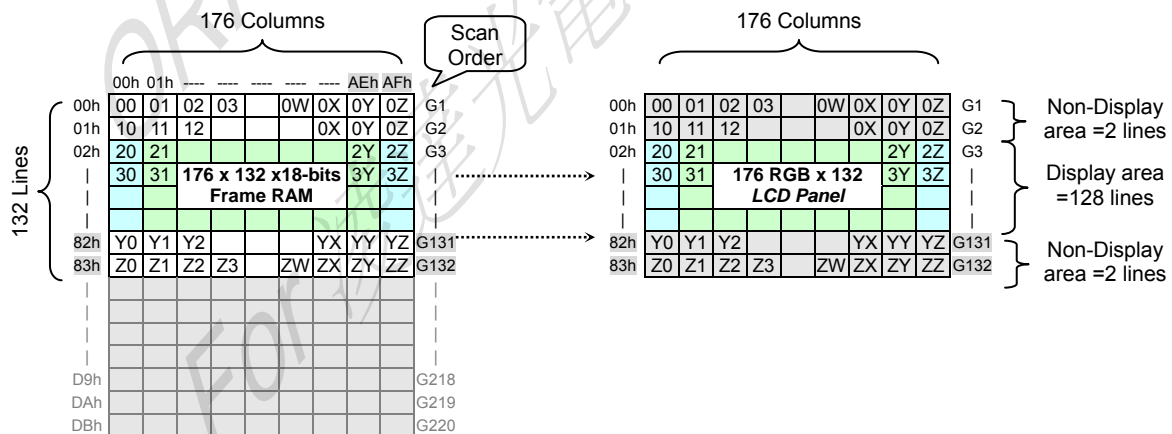

7.5.3.3. When using 176RGB x 132 resolution (GM1, GM0 = "11")

In this mode, contents of the frame memory within an area where column pointer is 00h to AFh and page pointer is 000h to 83h is displayed.
To display a dot on leftmost top corner, store the dot data at (column pointer, row pointer) = (0, 0).

(1) Example for Normal Display On (MX=MY=ML='0', SMX=SMY='0')

(2) Example for Partial Display On (PSL[7:0]=02h, PEL[7:0]=81h, MX=MV=ML='0', SMX=SMY='0')

7.5.4. Vertical Scroll Mode

There is vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

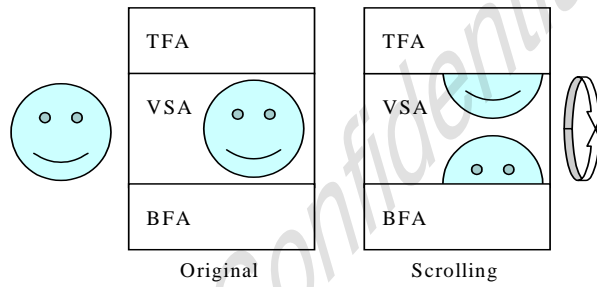

Fig. 7.5.4.1 Difference between Scrolling and original

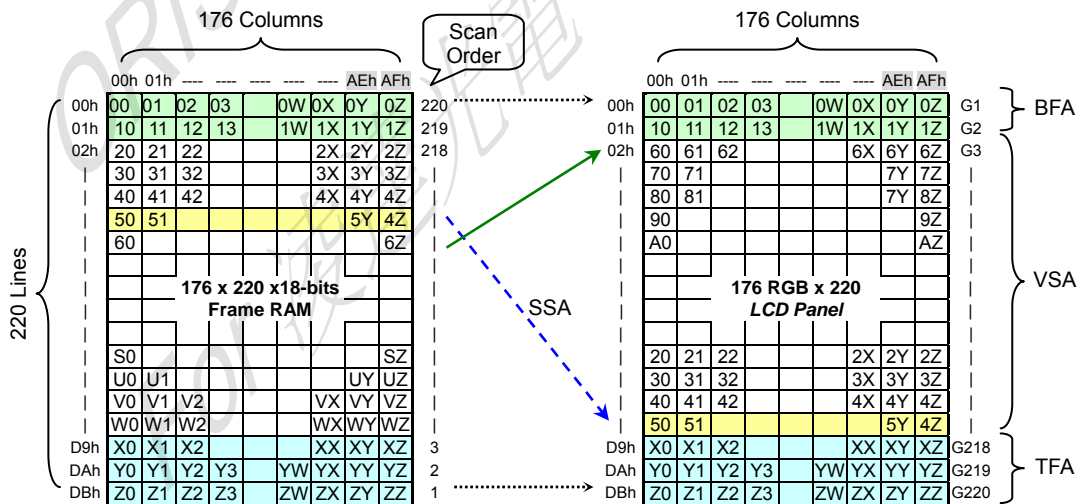

7.5.4.1. When using 176RGB x 220 resolution (GM1, GM0 = "00")

When Vertical Scrolling Definition Parameters (TFA+VSA+BFA)=220. In this case, scrolling is applied as shown below.

(1) Example for TFA =3, VSA=215, BFA=2, SSA=4, ML=0: Scrolling

(2) Example for TFA =3, VSA=215, BFA=2, SSA=215, ML=1: Scrolling: TFA and BFT are exchanged

7.5.5. Vertical Scroll Example

Vertical Scroll Example (GM1, GM0 = "00")

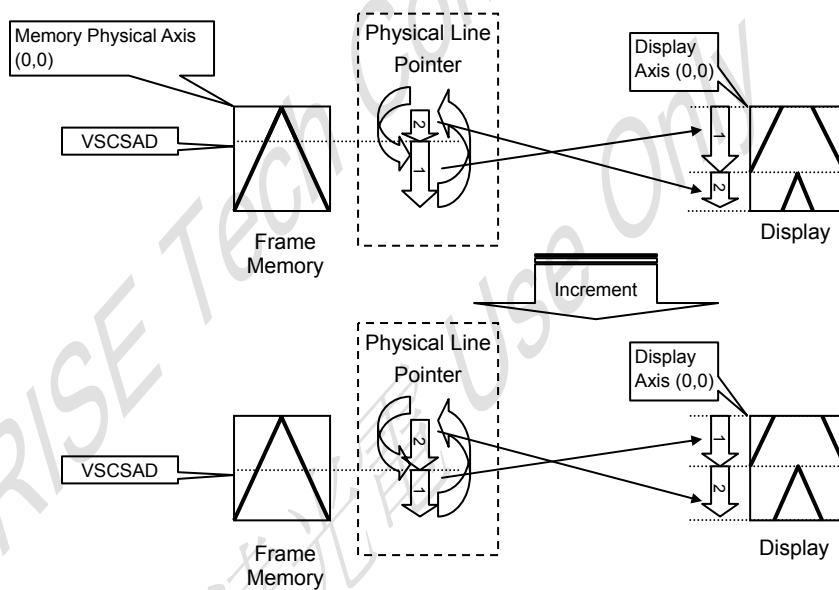

There are 2 types of vertical scrolling, which are determined by the commands "Vertical Scrolling Definition" (33h) and "Vertical Scrolling Start Address" (37h).

Case 1: TFA + VSA + BFA ≠ 220

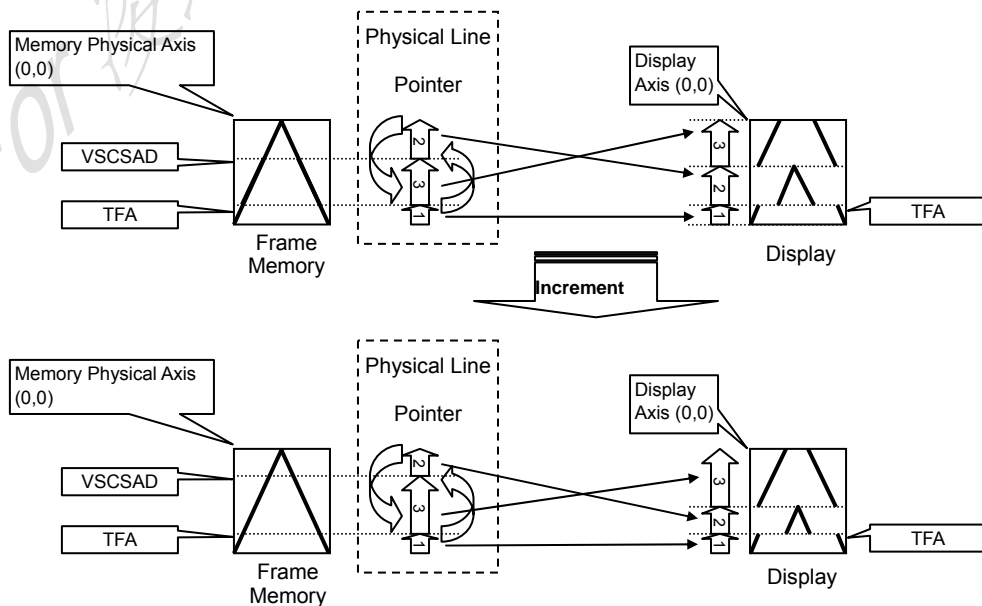

N/A. Do not set TFA + VSA + BFA ≠ 160. In that case, unexpected picture will be shown.

Case 2: TFA + VSA + BFA = 220 (Scrolling)

Example1) When MADCTR parameter ML="0", TFA=0, VSA=220, BFA=0 and VSCSAD=80.

Example2) When MADCTR parameter ML="1", TFA=30, VSA=190, BFA=0 and VSCSAD=80.

7.6. Address Counter

The address counter sets the addresses of the display data RAM for writing and reading. (Example for GM1, GM0 = "00")

Data is written pixel-wise into the RAM matrix of DRIVER. The data for one pixel or two pixels is collected (RGB 8-8-8-bit), according to the data formats. As soon as this pixel-data information is complete the "Write access" is activated on the RAM. The locations of RAM are addressed by the address pointers. The address ranges are X=0 to X=175 (AFh) and Y=0 to Y=219 (DBh). Addresses outside these ranges are not allowed. Before writing to the RAM a window must be defined into which will be written. The window is programmable via the command registers XS, YS designating the start address and XE, YE designating the end address.

For example the whole display contents will be written, the window is defined by the following values: XS=0 (0h) YS=0 (0h) and XE=175 (AFh), YE=219 (DBh).

In vertical addressing mode (MV=1), the Y-address increments after each byte, after the last Y-address (Y=YE), Y wraps around to YS and X increments to address the next column. In horizontal addressing mode (V=0), the X-address increments after each byte, after the last X-address (X=XE), X wraps around to XS and Y increments to address the next row. After the every last address (X=XE and Y=YE) the address pointers wrap around to address (X=XS and Y=YS).

For flexibility in handling a wide variety of display architectures, the commands "CASET, RASET" and "MADCTR", define flags MX and MY, which allows mirroring of the X-address and Y-address. All combinations of flags are allowed. Fig. 6.6.1 show the available combinations of writing to the display RAM. When MX, MY and MV will be changed the data must be rewritten to the display RAM.

For each image condition, the controls for the column and row counters apply as Fig. 7.6.1 below:

Condition	Column Counter	Row Counter
When RAMWR/RAMRD command is accepted	Return to "Start Column (XS)"	Return to "Start Row (YS)"
Complete Pixel Read / Write action	Increment by 1	No change
The Column counter value is larger than "End Column (XE)"	Return to "Start Column (XS)"	Increment by 1
The Column counter value is larger than "End Column (XE)" and the Row counter value is larger than "End Row (YE)"	Return to "Start Column (XS)"	Return to "Start Row (YS)"

7.7. Memory Data Write/ Read Direction

The data is written in the order illustrated above. The Counter which dictates where in the physical memory the data is to be written is controlled by "Memory Data Access Control" Command, bits B5 (MV), B6 (MX), B7 (MY) as described below.

Data Stream order is like in this figure

Fig. 7.7.1 Data streaming order

-When 176RGBx220 (GM='00')

MV	MX	MY	CASET	RASET
0	0	0	Direct to Physical Column Pointer	Direct to Physical Row Pointer
0	0	1	Direct to Physical Column Pointer	Direct to (219-Physical Row Pointer)
0	1	0	Direct to (127-Physical Column Pointer)	Direct to Physical Row Pointer
0	1	1	Direct to (127-Physical Column Pointer)	Direct to (219-Physical Row Pointer)
1	0	0	Direct to Physical Row Pointer	Direct to Physical Column Pointer
1	0	1	Direct to (159-Physical Row Pointer)	Direct to Physical Column Pointer
1	1	0	Direct to Physical Row Pointer	Direct to (175-Physical Column Pointer)
1	1	1	Direct to (159-Physical Row Pointer)	Direct to (175-Physical Column Pointer)

Note: Data is always written to the Frame Memory in the same order, regardless of the Memory Write Direction set by MADCTL bits B7 (MY), B6 (MX), B5 (MV). The write order for each pixel unit is

D17	D16	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R5	R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B5	B4	B3	B2	B1	B0

Frame Data Write Direction According to the MADCTR parameters (MV, MX and MY)

Display Data Direction	MADCTR Parameter			Image in the Host (MPU)	Image in the Driver (DDRAM)
	MV	MX	MY		
Normal	0	0	0		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: CASET Y: RASET</p>
Y-Mirror	0	0	1		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: CASET Y: RASET</p>
X-Mirror	0	1	0		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: CASET Y: RASET</p>
X-Mirror Y-Mirror	0	1	1		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: CASET Y: RASET</p>
X-Y Exchange	1	0	0		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: RASET Y: CASET</p>
X-Y Exchange Y-Mirror	1	0	1		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: RASET Y: CASET</p>
X-Y Exchange X-Mirror	1	1	0		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: RASET Y: CASET</p>
X-Y Exchange X-Mirror Y-Mirror	1	1	1		<p>H/W position (0,0) →</p> <p>X-Y address (0,0) X: RASET Y: CASET</p>

7.8. Tearing Effect Output Line

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

7.8.1. Tearing Effect Line Modes

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

t_{vdh} = The LCD display is not updated from the Frame Memory

t_{vdl} = The LCD display is updated from the Frame Memory (except Invisible Line – see below)

Mode 2, the Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 162 H-sync pulses per field.

t_{hdh} = The LCD display is not updated from the Frame Memory

t_{hdh}' = The LCD display is updated from the Frame Memory (except Invisible Line – see above)

Note: During Sleep In Mode, the Tearing Output Pin is active Low.

7.8.2. Tearing Effect Line Timings

The Tearing Effect signal is described below:

Table 7.8.2.1 AC characteristics of Tearing Effect Signal Idle Mode Off (Frame Rate = 58.9 Hz)

Symbol	Parameter	min	max	unit	description
t_{vdl}	Vertical Timing Low Duration	13	-	ms	
t_{vdh}	Vertical Timing High Duration	1000	-	μ s	
t_{hdl}	Horizontal Timing Low Duration	33	-	μ s	
t_{hdh}	Horizontal Timing High Duration	25	500	μ s	

NOTE: The timings in Table 7.8.2.1 apply when MADCTR ML=0 and ML=1

The signal's rise and fall times (t_r , t_f) are stipulated to be equal to or less than 15ns.

The Tearing Effect Output Line is fed back to the MPU and should be used as shown below to avoid Tearing Effect:

7.8.3. Example 1: MPU Write is faster than panel read.

Data write to Frame Memory is now synchronized to the Panel Scan. It should be written during the vertical sync pulse of the Tearing Effect Output Line. This ensures that data is always written ahead of the panel scan and each Panel Frame refresh has a complete new image:

7.8.4. Example 2: MPU write is slower than panel read.

The MPU to Frame Memory write begins just after Panel Read has commenced i.e. after one horizontal sync pulse of the Tearing Effect Output Line. This allows time for the image to download behind the Panel Read pointer and finishing download during the subsequent Frame before the Read Pointer "catches" the MPU to Frame memory write position.

7.9. Preset Values

ORISE has already set all preset values in SPFD54126B. Any of these preset values do not need customer's SW support.

7.10. Power ON/OFF Sequence

VDDI and VDD can be applied in any order.

VDDI and VDD can be powered down in any order.

During power off, if LCD is in the Sleep Out mode, VDD and VDDI must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, VDDI or VDD can be powered down minimum 0msec after RESX has been released.

CSX can be applied at any timing or can be permanently grounded. RESX has priority over CSX.

Note 1: There will be no damage to the display module if the power sequences are not met.

Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

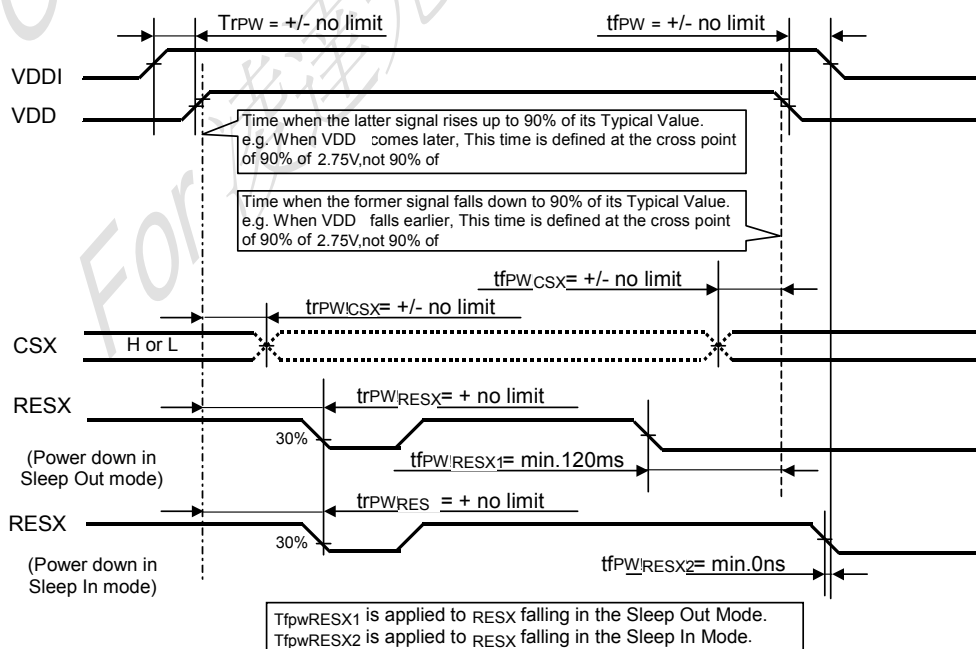

Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

If RESX line is not held stable by host during Power On Sequence, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

The power on/off sequence is illustrated below:

7.10.1. Case 1 – RESX Line is held High or Unstable by Host at Power On

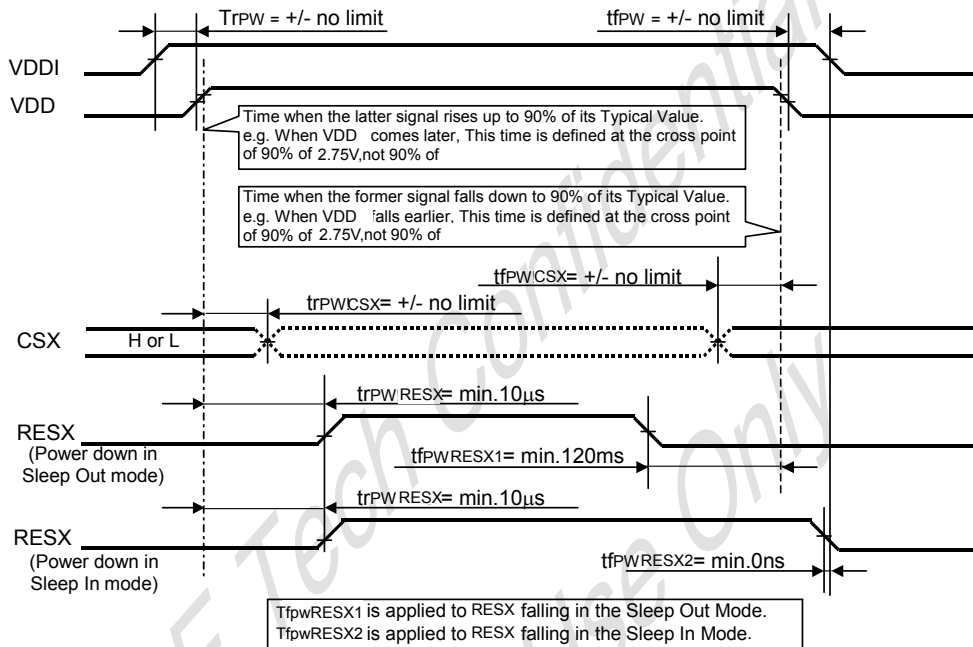

If RESX line is held High or unstable by the host during Power On, then a Hardware Reset must be applied after both VDD and VDDI have been applied – otherwise correct functionality is not guaranteed. There is no timing restriction upon this hardware reset.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

7.10.2. Case 2 – RESX Line is Held Low by Host at Power On

If RESX line is held Low (and stable) by the host during Power On, then the RESX must be held low for minimum 10 μ sec after both VDD and VDDI have been applied.

Note: Unless otherwise specified, timings herein show cross point at 50% of signal/power level.

7.10.3. Uncontrolled Power Off

The uncontrolled power off means a situation when e.g. there is removed a battery without the controlled power off sequence. There will not be any damages for the display module or the display module will not cause any damages for the host or lines of the interface.

At an uncontrolled power off the display will go blank and there will not be any visible effects within (TBD) second on the display (blank display) and remains blank until "Power On Sequence" powers it up.

7.11. Power Level Definition

7.11.1. Power Level

6 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption:

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 262,144 colors.

2. Partial Mode On, Idle Mode Off, Sleep Out.

In this mode part of the display is used with maximum 262,144 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

4. Partial Mode On, Idle Mode On, Sleep Out.

In this mode, part of the display is used but with 8 colors.

5. Sleep In Mode

In this mode, the DC: DC converter, Internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VDDI power supply. Contents of the memory are safe.

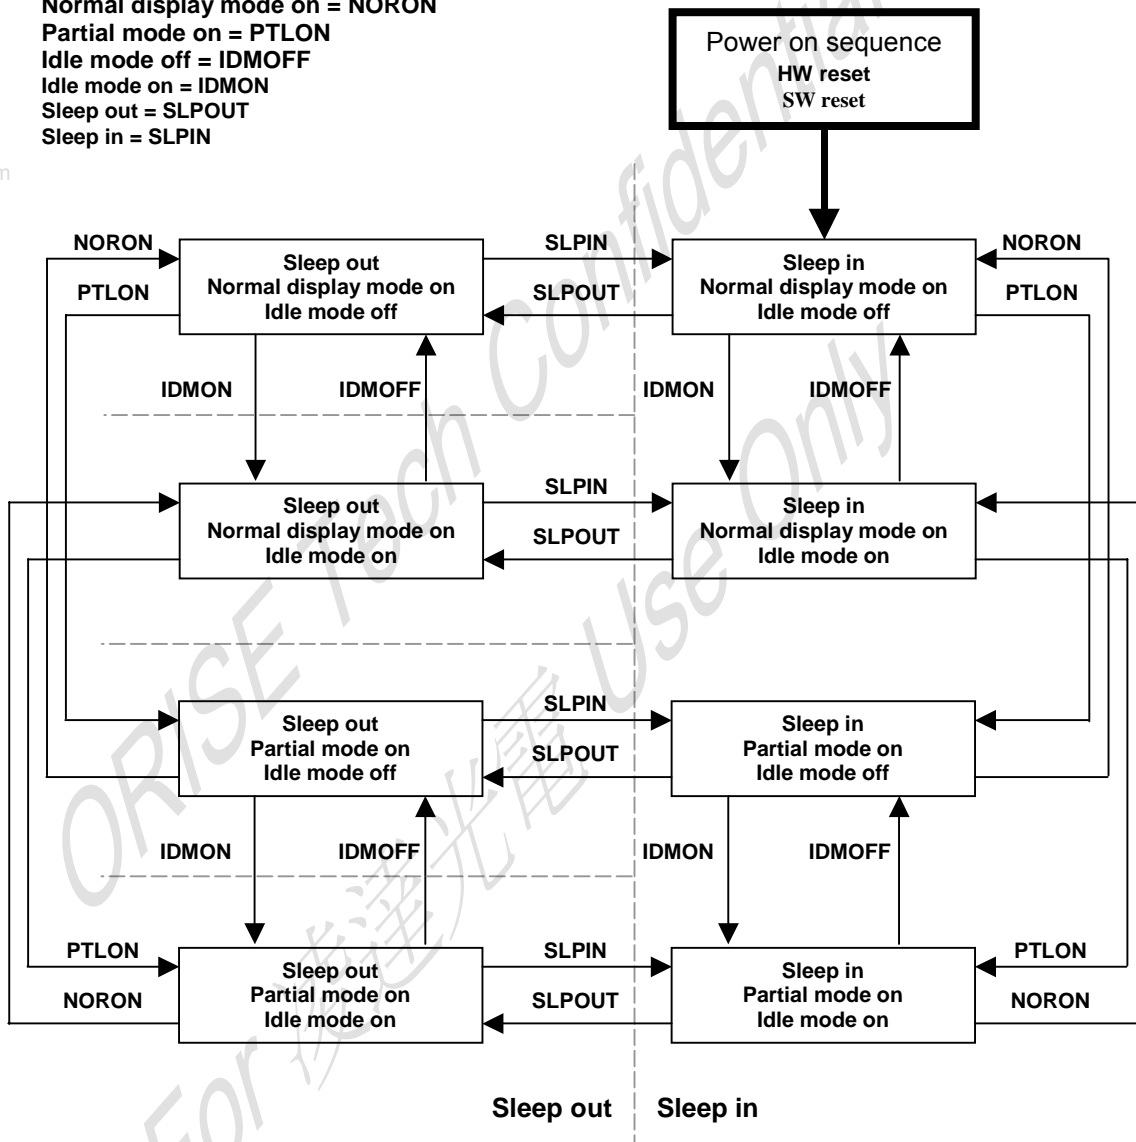

6. Power Off Mode

In this mode, both VDD and VDDI are removed.

Note: Transition between modes 1-5 is controllable by MCU commands. Mode 6 is entered only when both Power supplies are removed.

7.11.2. Power Flow Chart

Normal display mode on = NORON
 Partial mode on = PTLON
 Idle mode off = IDMOFF
 Idle mode on = IDMON
 Sleep out = SLPOUT
 Sleep in = SLPIN

Note 1: There is not any abnormal visual effect when there is changing from one power mode to another power mode.

Note 2: There is not any limitation, which is not specified by this spec, when there is changing from one power mode to another power mode.

7.12. Gamma Curves

7.13. Reset
7.13.1. Reset Value
7.13.1.1. Reset Table (Default Value, GM=00, 176RGB x 220)

Item	After Power On	After Hardware Reset	After Software Reset
Frame memory	Random	No Change	No Change
Sleep In/Out	In	In	In
Display On/Off	Off	Off	Off

Notes 1. There will be no abnormal visible effects on the display when S/W or H/W Reset is applied.

Notes:2. Powered-On Reset finishes within 10 μ s after both VDD & VDDI are applied.

Notes:3. TE Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

Notes:2. Powered-On Reset finishes within 10 μ s after both VDD & VDDI are applied.

Notes:3. TE Mode 1 means Tearing Effect Output Line consists of V-Blanking Information only.

7.13.2. Module Input/Output Pins

7.13.2.1. Output or Bi-directional (I/O) Pins

Output or Bi-directional pins	After Power On	After Hardware Reset	After Software Reset
TE	Low	Low	Low
D7 to D0 (Output driver)	High-Z (Inactive)	High-Z (Inactive)	High-Z (Inactive)

Note: There will be no output from D7-D0 during Power On/Off sequence, Hardware Reset and Software Reset.

7.13.2.2. Input Pins

Input pins	During Power On Process	After Power On	After Hardware Reset	After Software Reset	During Power Off Process
RESX	See 6.10	Input valid	Input valid	Input valid	See 6.10
CSX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D/CX	Input invalid	Input valid	Input valid	Input valid	Input invalid
WRX	Input invalid	Input valid	Input valid	Input valid	Input invalid
RDX	Input invalid	Input valid	Input valid	Input valid	Input invalid
D7 to D0	Input invalid	Input valid	Input valid	Input valid	Input invalid
P/SX	Input invalid	Input valid	Input valid	Input valid	Input invalid

7.13.3. Reset Timing

Table 7.13.3.1 Reset input timing

VSS=0V, VDDI=1.6V to 3.6V, VDD=2.6V to 3.5V, Ta = -30 to 70°C)

Symbol	Parameter	Related Pins	MIN	TYP	MAX	Note	Unit
t_{RESW}	*1) Reset low pulse width	RESX	10	-	-	-	μ s
t_{REST}	*2) Reset complete time	-	-	-	5	When reset applied during Sleep in mode	ms
		-	-	-	120	When reset applied during Sleep out mode	ms

Note 1) Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below.

RESX Pulse	Action
Shorter than 5 μ s	Reset Rejected
Longer than 10 μ s	Reset
Between 5 μ s and 10 μ s	Reset starts (It depends on voltage and temperature condition.)

Note 2. During the resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out -mode. The display remains the blank state in Sleep In -mode) and then return to Default condition for H/W reset.

 Note 3. During Reset Complete Time, ID2 and VCOMOF value in OTP will be latched to internal register during this period. This loading is done every time when there is H/W reset complete time (t_{REST}) within 5ms after a rising edge of RESX.

Note 4. Spike Rejection also applies during a valid reset pulse as shown below:

Note 5. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

7.15. Sleep Out-Command and Self-Diagnostic Functions of the Display Module

7.15.1. Register Loading Detection

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if the display module loading function of factory default values from OTP (one-time programming memory) to registers of the display controller is working properly.

There are compared factory values of the OTP and register values of the display controller by the display controller. If those both values (OTP and register values) are same, there is inverted (=increased by 1) a bit in "Read Display Self-Diagnostic Result (0Fh)" (=RDDSDR) (The used bit of this command is D7). If those both values are not same, this bit (D7) is not inverted (= increased by 1).

The flow chart for this internal function is following:

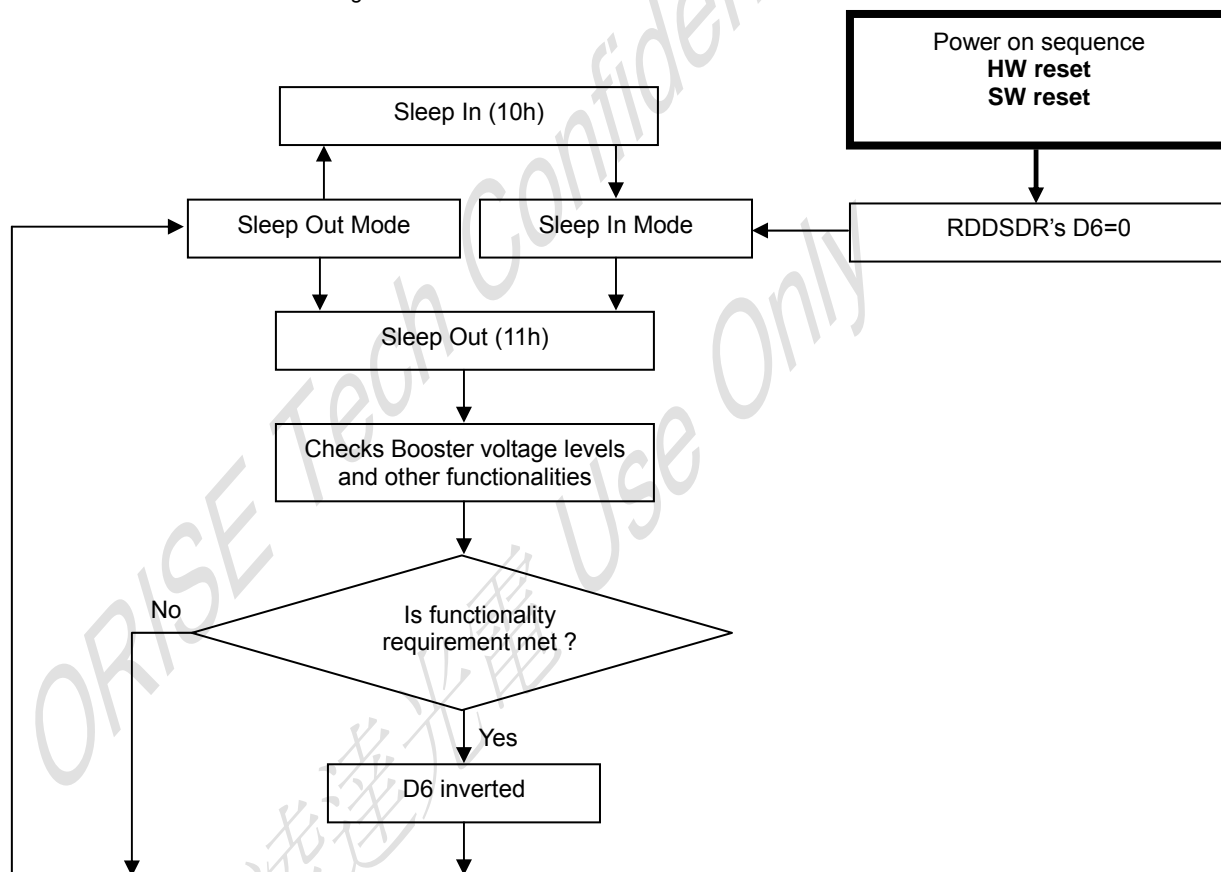

Note: There is not compared and loaded register values, which can be changed by user (00h to AFh and DAh to DDh), by the display module.

7.15.2. Functionality Detection

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if the display module is still running and meets functionality requirements.

The internal function (= the display controller) is comparing, if the display module is still meeting functionality requirements (only Booster voltage level). If functionality requirement is met, there is inverted (= increased by 1) a bit in "Read Display Self- Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D6). If functionality requirement is not same, this bit (D6) is not inverted (= increased by 1).

The flow chart for this internal function is following:

Note: There is needed 120msec after Sleep Out -command, when there is changing from Sleep In -mode to Sleep Out -mode, before there is possible to check if functionality requirements are met and a value of RDDSDR's D6 is valid. Otherwise, there is 5msec delay for D6's value, when Sleep Out -command is sent in Sleep Out -mode.

7.15.3. Chip Attachment Detection

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if a chip or chips (e.g. driver, etc.) of the display module is/are attached to the circuit route of a flex foil or display glass ITO.

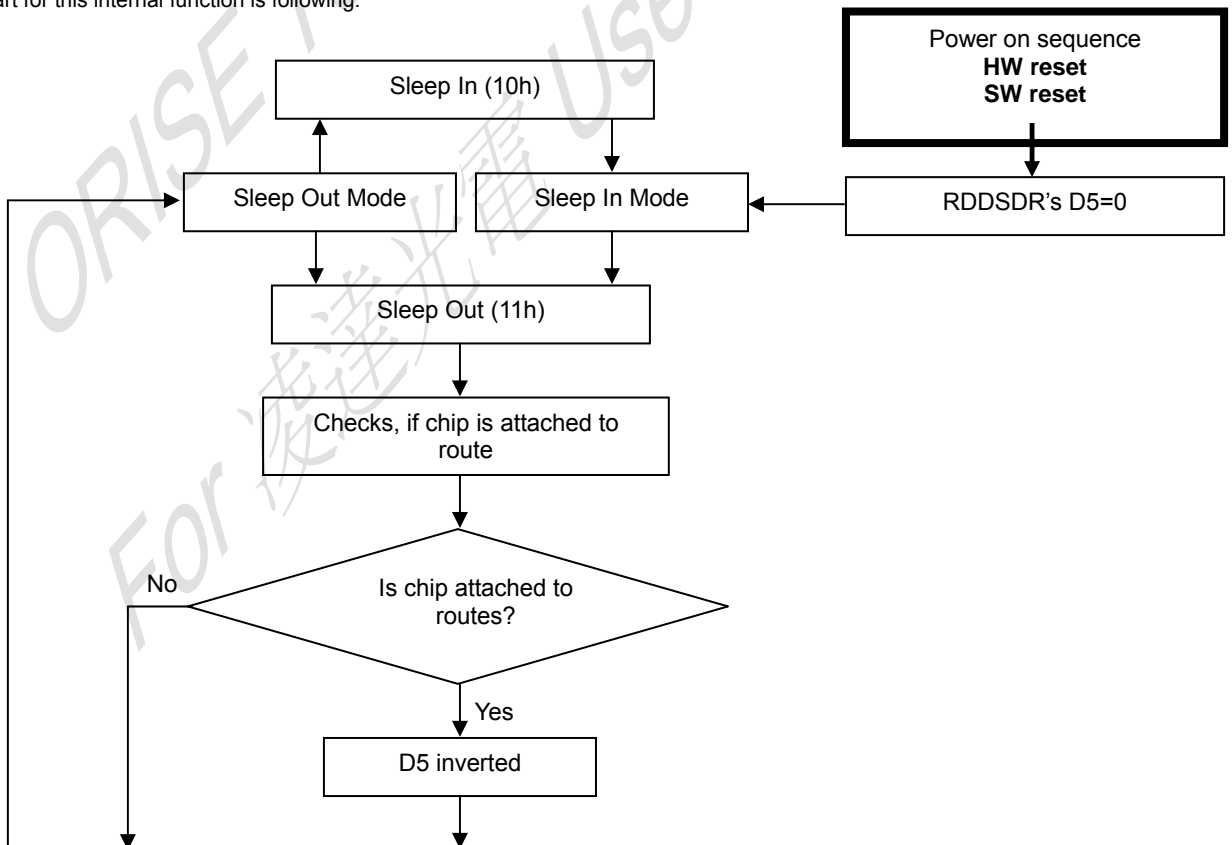

There is inverted (= increased by 1) a bit in command "Read Display Self- Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D5), if the chip or chips is/are attached to the circuit route of the flex or display glass. If this chip is or those chips are not attached to the circuit route of the flex or display glass, this bit (D5) is not inverted (= increased by 1).

The following figure is for reference purposes; how this chip attachment can be implemented e.g. there are connected together 2 bumps via route of ITO or the flex foil on 4 corners of the driver (chip).

www.DataSheet4U.com

The flow chart for this internal function is following:

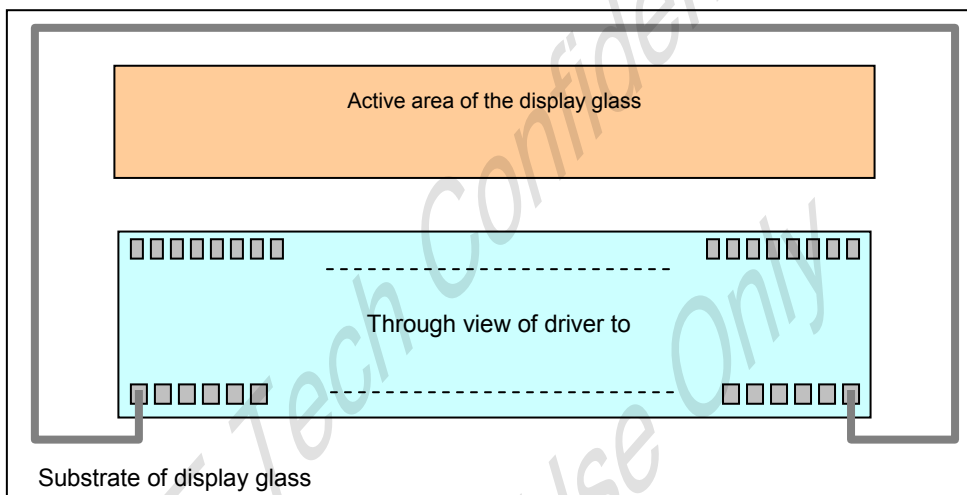

7.15.4. Display Glass Break Detection

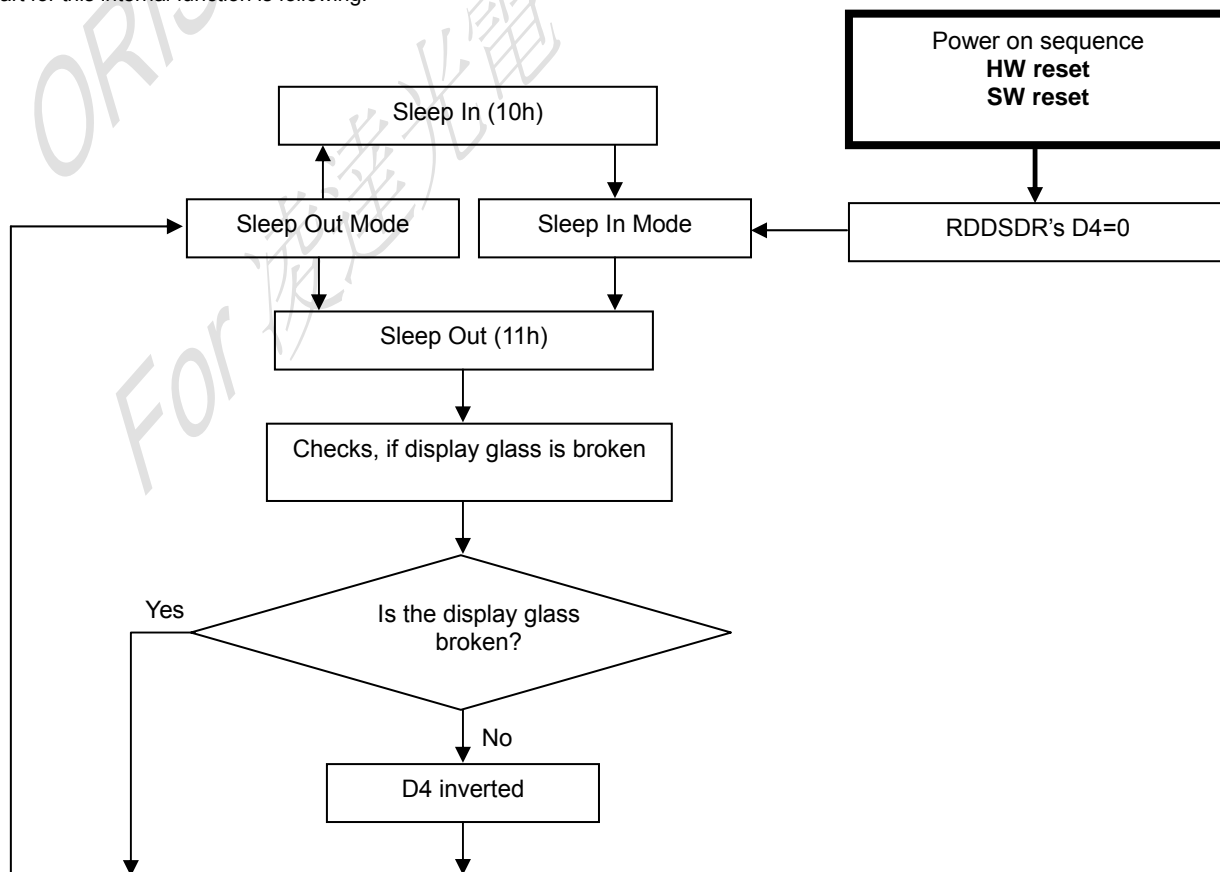

Sleep Out-command is a trigger for an internal function of the display module, which indicates, if the display glass of the display module is broken or not.

There is inverted (= increased by 1) a bit in "Read Display Self-Diagnostic Result (0Fh)" (= RDDSDR) (The used bit of this command is D4), if the display glass is not broken. If this display glass is broken, this bit (D4) is not inverted (= increased by 1).

The following figure is a reference, how this glass break detection can be implemented e.g. there is connected together 2 bumps via route of ITO. This route of ITO is the nearest route of the edge of the display glass.

The flow chart for this internal function is following:

7.16. Oscillator

The chip has on-chip oscillator that does not require external components. This oscillator output signal is used for system clock generation for internal display operation.

7.17. System Colck Generator

The timing generator produces the various signals to dirver the internal circuitty. Internal chip operation is not affected by operations on the data bus.

7.18. Instruction Decoder and Register

The instruction decoder indentifies command words arriving at the interface and routes the following data bytes to their destination. The command set can be found in "Command" section.

7.19. Source Driver

The source driver block includes 176x3 source outputs (S1 to S528), which should be connected directly to the TFT-LCD. The source output signals are generated in the data processing block after the data is read out of the RAM and latched, which represent the simulatance selected rows.

7.20. Gate Driver

The gate dirver block include 220 chanel gate output (G1 to G220) which should be connected directly to the TFT-LCD.

7.20.1. Gate Driver

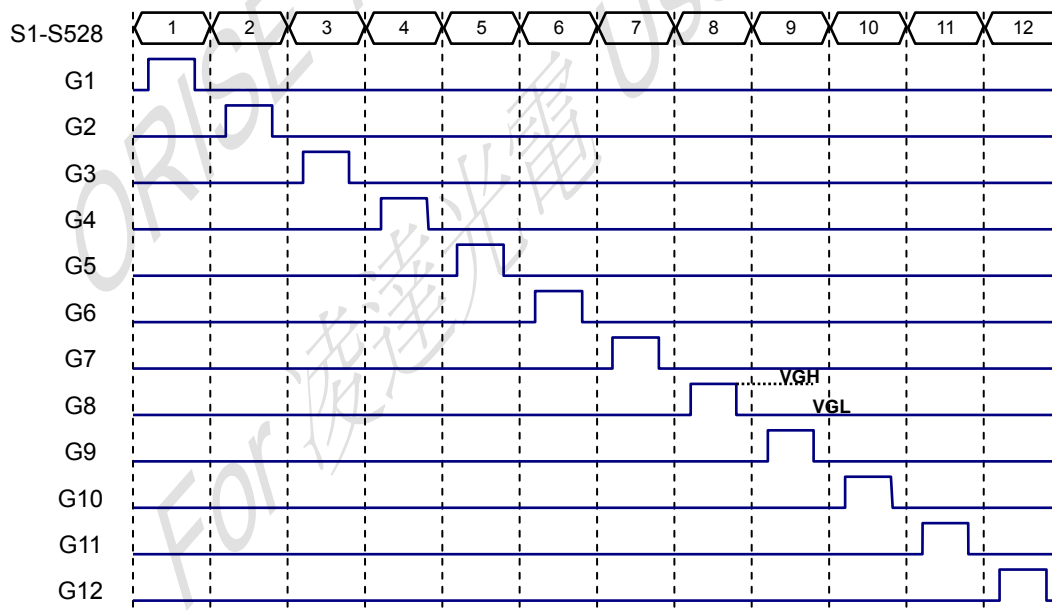

Fig. 7.20.1 Gate Driver Output Option 1

7.21. γ -CORRECTION FUNCTION

The SPFD54126B adopts true 6-bit OP-AMP with adjustable γ -correction function to display in 262,144 colors. The adjustable γ -correction can be set by 10 groups of registers to determine eight reference grayscale levels, which are gradient adjustment, amplitude adjustment and fine-adjustment registers. Each register group can be set independently to other register groups.

7.22. VSYNC Interface

The SPFD54126B incorporates a VSYNC-I/F, which enables to display a moving picture with only a system interface and frame-synchronizing signal (VS). This interface enables to display moving pictures with minimum modification to a conventional system.

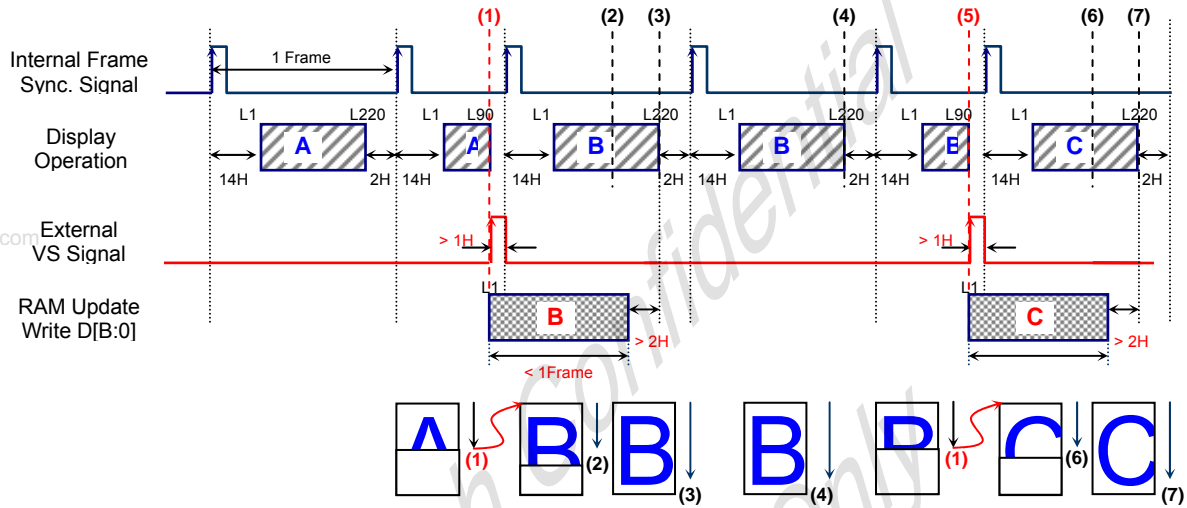

Fig. 7.21.1 VSYNC Interface for 8-bits data bus (Example)

The VSYNC-I/F is turned ON by **VSYNC-I/F ON (ADH)** command and turned OFF by **VSYNC-I/F OFF (ACH)** command. In VSYNC-I/F mode, internal display operations are synchronized with VS. The VSYNC-I/F enables to display a moving picture through a system interface and update screens without flicker by writing data to RAM through a system interface in higher speed than the internal display operations by some degree.

The VSYNC-I/F executes display operations only with internal clocks generated by internal oscillators and VS input. All display data are stored in RAM so that only the data relevant to updating a screen are transferred to minimize data transmission while displaying a moving picture.

- Leading Mode

- Lagging Mode

1. In RCM1, RCM0 = "01" mode, writing data to RAM on rising edge of VS signal
2. If high pulse of VS signal should be large than 1-lines.
3. The BP and FP should follow conditions : $BP \geq 2\text{-lines}$, $FP \geq 2\text{-lines}$ and $BP+FP = 16\text{-lines}$
4. The signals (CSX, WRX, D/CX and VS) of VSYNC I/F should follow MCU Parallel Interface AC timing.
5. B=17.

The VSYNC-I/F has limits on the minimum RAM write speed through the system interface and the frequency of the internal clocks. It requires a RAM write speed more than the calculated result from the following formula.

- Internal clock frequency (fosc) [Hz]

$$= \text{Frame Frequency} \times (\text{DisplayLines} + \text{Front Porch(VSFP)} + \text{BackPorch (VSBP)}) \times 16(\text{clocks}) \times \text{fluctuation}$$

$$\text{RAM Write Speed (Min) (Hz)} = \frac{176 \times \text{Display Line}(220\text{Line})}{\text{BackPorch (VSBP)} + \text{Display Line} - \text{margins}} \times 16(\text{clocks}) \times \frac{1}{fosc}$$

Note 1: When RAM write does not start right after the falling edge of VS, the time from the falling edge of VS until RAM write starts must also be taken into account.

Example of RAMs writes speed and the frequency of the internal clocks in VSYNC-I/F mode is as follows.

Example:

Display size: 176 RGB × 220 lines

Raster-rows: 220 lines

Back/ Front porch: 14/ 2 lines (VSBP = 1110/ VSFP = 0010 of AFH)

-When Frame frequency: 60 Hz

Internal clock frequency (fosc) [Hz] =

$$60\text{Hz} \times (220+2+14) \text{ lines} \times 16 \text{ Clocks} \times 1.1 / 0.9 = 277\text{kHz}$$

When calculating an internal clock frequency, possible causes of fluctuations must also be taken into consideration. In this example, the allowance for the fluctuation is ± 10 % from the center value, and the frequency must be within a VS cycle.

Also in this example, variations attributed to LSI fabrication and room temperature are taken into consideration as causes of fluctuations. Other possible causes of fluctuations, such as variations in external resistors or voltage changes are not considered in this example. It is necessary to make a setting with enough margins to accommodate

-When Frame frequency: 60Hz

Minimum speed for RAM writing [Hz] >

$$176 \times 220 / \{(14+220-2) \text{ lines} \times 16 \text{ clock}\} / 300 \text{ kHz} = 2.89\text{MHz}$$

Note 2: The above calculation is premised on the case of writing data to RAM on the falling edge of VS.

Note 3: There must at least be a margin of 2 processing lines when all one-frame data are written to RAM before the SPFD54126 starts processing display lines.

By writing data to RAM on rising edge of VS signal at speed of 2.89MHz (Frame rate=60Hz) or more, it is possible to overwrite an entire screen without flicker by completing data write operation of a line before it starts display operation of that line.

Fig. 7.28.3 Write/Display Operation Timing via VSYNC-I/F

Notes to the VSYNC Interface

1. The aforementioned example of calculation is just a result of calculation. In actual settings, possible causes of fluctuations should be taken into consideration. It is necessary to give enough margins when setting a RAM writing speed.
2. The aforementioned example of calculation is the value in case of overwriting full screen. If a moving picture display area is limited, it will result in more margins between RAMs write and display operations.

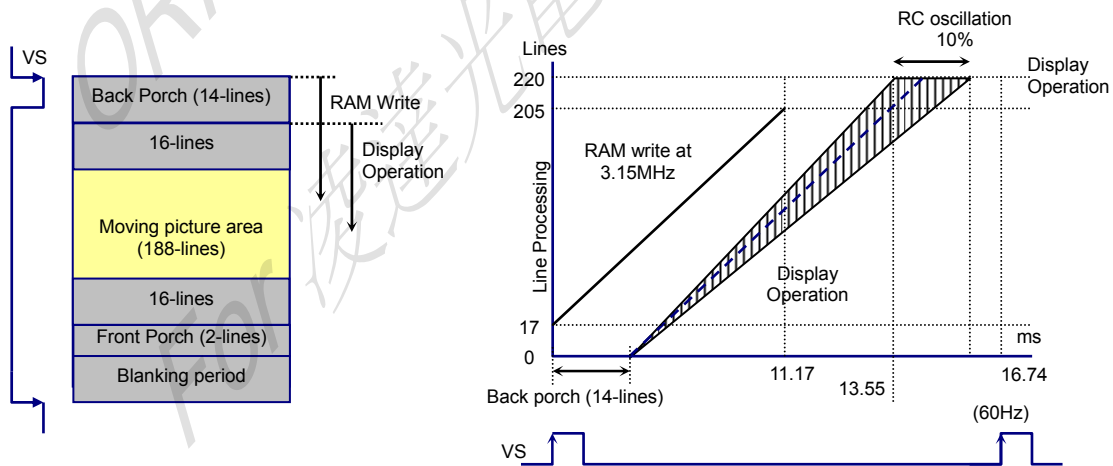

Fig. 7.28.4 RAM write speed margin

3. A front porch period continues after completion of 1 frame and until the next input of VS.
4. The partial display and vertical scroll functions are not available with the VSYNC-I/F.

8. ELECTRICAL SPECIFICATIONS
8.1. DC Characteristic AC Characteristic (VDD=2.6V~3.0V, VDDIO = 1.6V~3.0V, Ta = -40°C ~ 85°C)

	T_{SHW}	SCL "H" pulse width (Write)	35		ns	
	T_{SLW}	SCL "L" pulse width (Write)	35		ns	
	T_{SCYCR}	Serial clock cycle (Read)	150		ns	
	T_{SHR}	SCL "H" pulse width (Read)	60		ns	
SDA (DIN) (DOUT)	T_{SLR}	SCL "L" pulse width (Read)	60		ns	
	T_{SDS}	Data setup time	30		ns	
	T_{SDH}	Data hold time	30		ns	
	T_{ACC}	Access time	10		ns	For maximum $C_L=30\text{pF}$
	T_{OH}	Output disable time	15		ns	For minimum $C_L=8\text{pF}$

Note 1: $V_{DD1}=1.6$ to 3.6V , $V_{DD}=2.6$ to 3.5V , $AGND=DGND=0\text{V}$, $T_a=-30$ to 70°C (to $+85^\circ\text{C}$ no damage)

Note 2: The input signal rise time and fall time (t_r , t_f) is specified at 15 ns or less.

Logic high and low levels are specified as 30% and 70% of V_{DD1} for Input signals.

9. PAD LOCATIONS

9.1. PAD Assignment

Chip Information:

Basic Information:

Chip Size: 18650 um x 950 um

Chip thickness: 300um(Typ)

Coordinates origin: Pad Left-bottom side

Au Bump: Height = 15um (Typ)

1. Output Pads

Item	Symbol	Size
Bump Pitch	A	23um
Bump Width	B	21um
Bump height	C	96um
Bump space 1	D	35um
Bump space 2	E	25um
Bump area	B x C	2016um ²
Chip boundary	F	45~70um

2. Input Pads

Item	Symbol	Size
Bump Pitch	A	64um
Bump Pitch1	B	80um
Bump Width	C	55um
Bump height	D	96um
Bump space 1	E	9um
Bump space 2	F	25um
Bump area	B x C	5280um ²
Chip boundary	G	45~70um

3. Alignment Marks

Al layer
 Clearance area
 Polyimide
 Gap

Item	Symbol	Size
Alignment mark size	A	105um
Clearance gap1	B	15um
Clearance gap2	D	40um
Alignment mark width	C	25um
Alignment area	A x A	11025um ²
Gap width	E	40~48um

10. DISCLAIMER

The information appearing in this publication is believed to be accurate.

Integrated circuits sold by ORISE Technology are covered by the warranty and patent indemnification provisions stipulated in the terms of sale only. ORISE Technology makes no warranty, express, statutory implied or by description regarding the information in this publication or regarding the freedom of the described chip(s) from patent infringement. FURTHERMORE, ORISE Technology MAKES NO WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PURPOSE. ORISE Technology reserves the right to halt production or alter the specifications and prices at any time without notice. Accordingly, the reader is cautioned to verify that the data sheets and other information in this publication are current before placing orders. Products described herein are intended for use in normal commercial applications. Applications involving unusual environmental or reliability requirements, e.g. military equipment or medical life support equipment, are specifically not recommended without additional processing by ORISE Technology for such applications. Please note that application circuits illustrated in this document are for reference purposes only.

10. REVISION HISTORY

Date	Revision #	Description	Page
NOV. 20, 2006	0.2	1. Change title: Package/PAD Locations to PAD Locations	220
		2. Modify 2. FEATURE	6
		3. Modify Table 6.1.2. (4) to (4) ~ (9)	20-22
		4. Modify Description of 6.3.19.	108
		5. Modify 6.3.22 Table	112.113
		6. Modify 6.3.23 Table	114.115
		7. Modify 6.3.23 Table	116.117
		8. Modify 6.3.23 Table	118.119
		9. Modify 6.3.23 Table	120.121
		10. Modify 6.3.23 Table	122.123
OCT. 26, 2006	0.1	Original	218
