## 320-CHANNEL LOW-VOLTAGE SEGMENT DRIVER FOR DOT-MATRIX STN LIQUID CRYSTAL DISPLAY

### 1. GENERAL DESCRIPTION

The SPLC563A is a 320-channel segment driver for driving a dot-matrix STN liquid-crystal panel at a low voltage. The driver can also correspond to 240-channel output by switching mode. It operates at a low voltage: a liquid-crystal drive voltage of 5.0V and a logic drive voltage of 3.0V, and is used together with common driver SPLC564A. The package, which adopts a flexible TCP, can be applied to various liquid crystal panels.

### 2. FEATURES

- Display duty: Up to 1/240
- Liquid crystal drive voltage: 2.6V to 5.5V
- Number of liquid crystal drive circuits: 320 circuits
- Operating voltage: 2.5V to 5.5V
- Number of data bits: 4 or 8 bits
- Shift clock speed: 8.0MHz max @ 5.0V, 6.5MHz max @ 3.0V
- Together with the common drivers SPLC564A
- Low power consumption
- Switching output mode: 320 output mode, 240 output mode
- Display-off function
- Flexible TCP
- Automatic generation of chip-enable signals
- Standby function

### 3. BLOCK DIAGRAM

**Note:** PINs V0L, VML, and V1L are internally connected to pins V0R, VMR, and V1R, respectively.

**3.1. Block Function Descriptions****3.1.1. Liquid crystal drive circuit**

Selects and outputs the liquid crystal drive level V0, VM, or V1 by DISPOFF and a combination of data for latch circuit 2 and signal M.

**3.1.2. Level shifter**

Converts logic signals to liquid crystal drive signals.

**3.1.3. Latch circuit 2**

320-bit latch circuit, which latches the data of latch circuits 1 at the fall of CL1 and outputs the data to the level shifter.

**3.1.4. Latch circuit 1**

4/8-bit parallel data latch circuit, which latches display data D0 to D7 according to signals transmitted from the shift register.

**3.1.5. Shift register**

80-bit shift register, which generates data-capture signals for latch circuits 1 at the fall of CL2.

**3.1.6. Data rearrangement circuit**

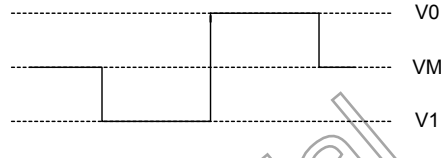

Inverts the order of data output crosswise.

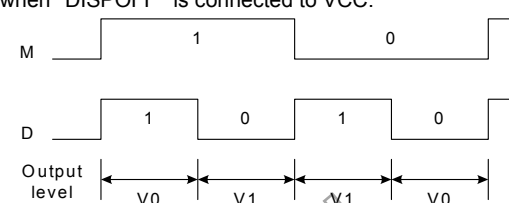

**3.1.7. Timing generator circuit**

The timing generator circuit generates data latch pulses for latch circuit2 and changes pulse the LCD drive outputs to AC.

**5. REARRANGING OUTPUT DATA (SHL)**

**6. OPERATION TIMING**
**6.1. 4-Bit Capture Mode (1line, 640 dots)**

**BS = GND (4-bit capture mode)**

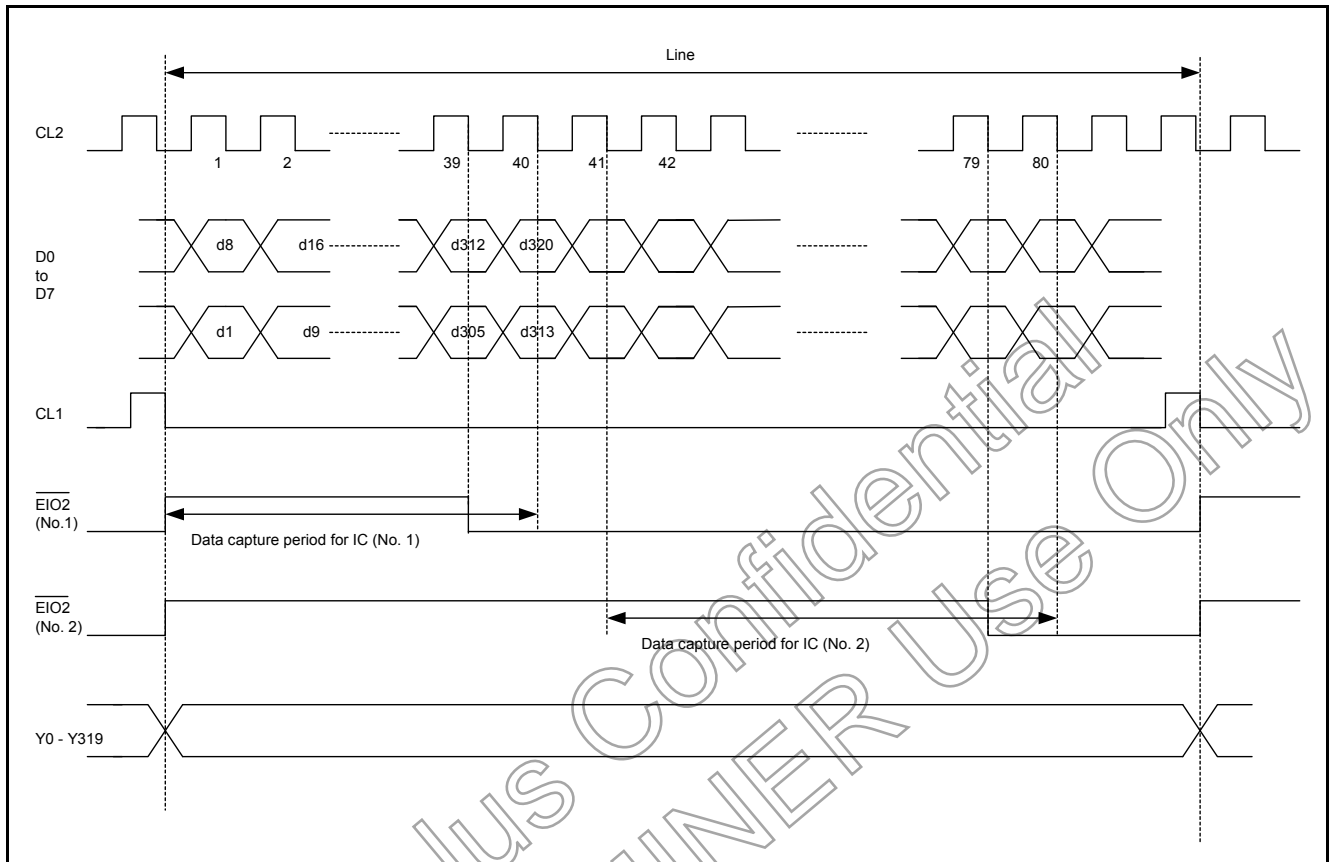

During the data standby state when the data capture operation enable signal is low (SHL = GND:  $\overline{\text{EIO1}}$ ), the next data capture clock (CL2) cancels the standby state. The 4-bit data is captured at the fall of CL2. When 316 bits are captured, the enable signal becomes the GND level (SHL = GND:  $\overline{\text{EIO2}}$ ). When 320 bits are captured, the operation automatically stops (the standby state is entered). The second IC is then activated when pin  $\overline{\text{EIO2}}$  is

connected to pin  $\overline{\text{EIO1}}$  of the second IC.

Data output changes at the fall of CL1.

During SHL = GND, captured data d1 and d320 are output to Y0 and Y319, respectively. During SHL = VCC, data d1 and d320 are output to Y319 and Y0, respectively.

**6.2. 8-Bit Capture Mode (1line, 640 dots)**

BS = VCC (8-bit capture mode)

The 8-bit display data is captured at the fall of CL2. Other basic operations are the same as those of the 4-bit capture mode.

**7. ELECTRICAL SPECIFICATIONS**
**7.1. Absolute Maximum Ratings**

Item	Symbol	Rating	Unit	Notes
Power supply voltage for logic circuits	VCC	- 0.3 to + 7.0	V	1, 4
Power supply voltage for LCD drive circuits	V <sub>0</sub>	- 0.3 to + 7.0	V	1, 4
Input voltage 1	VT1	- 0.3 to VCC + 0.3	V	1, 2
Input voltage 2	VT2	- 0.3 to V <sub>0</sub> + 0.3	V	1, 3, 4
Operating temperature	T <sub>OPR</sub>	- 30 to +75	°C	
Storage temperature	T <sub>STG</sub>	- 55 to +110	°C	

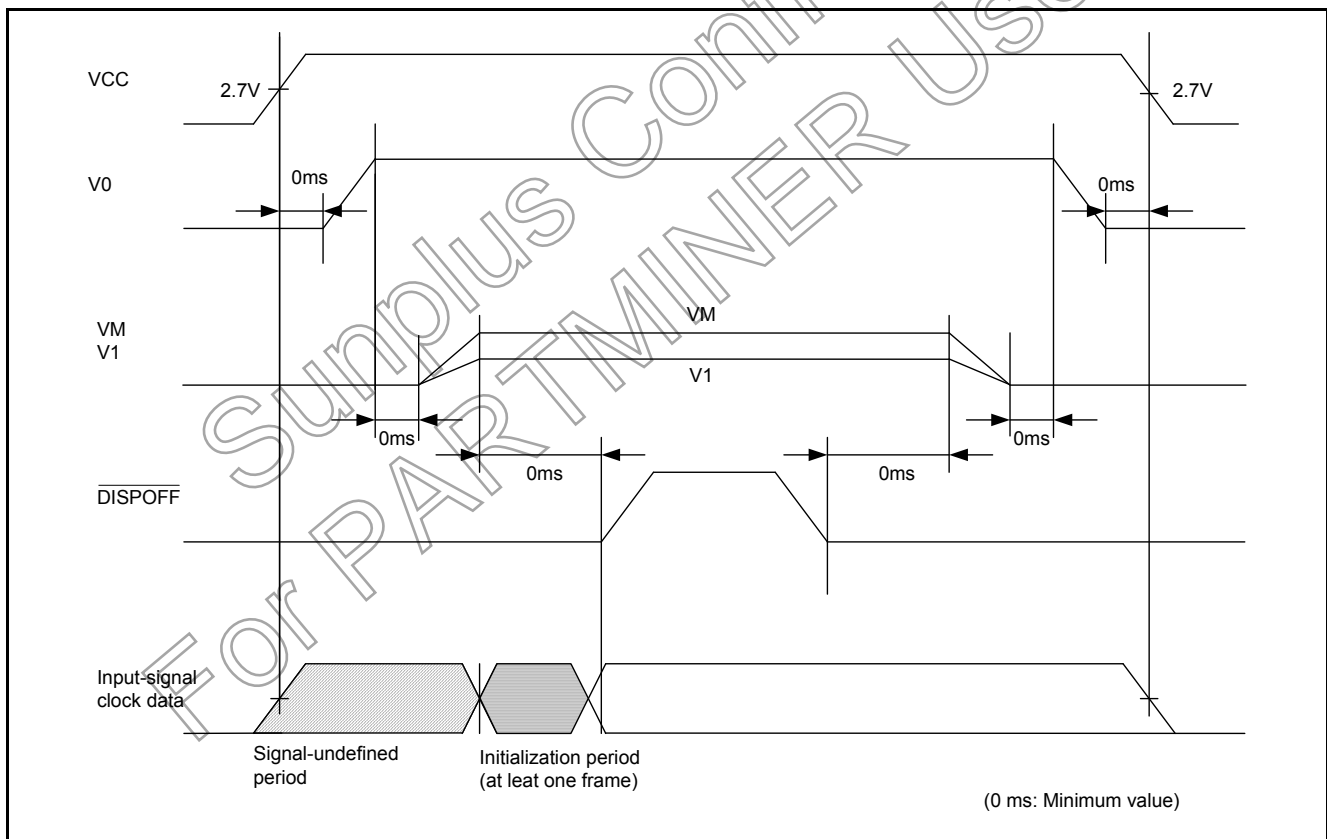

**Note1:** Potential from the GND

**Note2:** Applied to pins SHL, EIO1, EIO2, DISPOFF, D0 to D7, CL1, CL2, M, BS, and MODE.

**Note3:** Applied to VML, VMR, V1L, and VMR.

Operating the LSI in excess of the absolute maximum rating will result in permanent damage. Use the LSI observing electrical characteristic conditions in normal operation. Exceeding the conditions will cause malfunctions or will affect LSI reliability.

**Note4:** Conform to the following turn-on/off sequence of the power and signals. Otherwise, the LSI will malfunction or will be permanently damaged. In addition, LSI reliability will be affected.

### 7.1.1. Turning on the power

- 1). Turn on the power in the order of GND- VCC, GND-V0, and VM/V1. Then, ground the DISPOFF pin.
- 2). The LCD forcibly outputs the VM level by the DISPOFF function.
- 3). Even if an input signal is disturbed immediately after vcc is applied, the DISPOFF function has priority.
- 4). Input the specific signal to initialize registers in the driver. The initialization period must be at least one frame.
- 5). The preparation of normal display is completed. Input the vcc level to the DISPOFF pin to cancel the DISPOFF function. At this time, the level of pins V0, VM, and V1 must rise to the specific potential.

### 7.1.2. Turning off the power

The procedure is basically the reverse for turning on the power.

- 1). Ground the DISPOFF pin.
- 2). Turn off the liquid crystal power in the order of VM/V1 and GND-V0.
- 3). Ground VCC and an input signal.

At this time, the level of pins V0, VM, and V1 must fall to 0 V. Since the DISPOFF function stops when vcc falls to 0 V, the LCD may output a level other than VM. Therefore, a display failure may occur when the power is turned off or on.

**Note1:** Resistance between pins Y and V when a load current flows to one of the pins from Y0 to Y319. The following conditions are defined:

$$V0 - GND = 5.5V$$

$$VM = (V0 + V1)/2$$

$$V1 = GND + 1.0$$

The voltage range of the liquid crystal drive level power supply is described. A voltage around the GND is applied to pin V1, and an intermediate voltage of about V0 and V1 is applied to pin VM. Use the V1 in the range of DV = 0.25 x V0, in which the impedance Ron of driver output is stable.

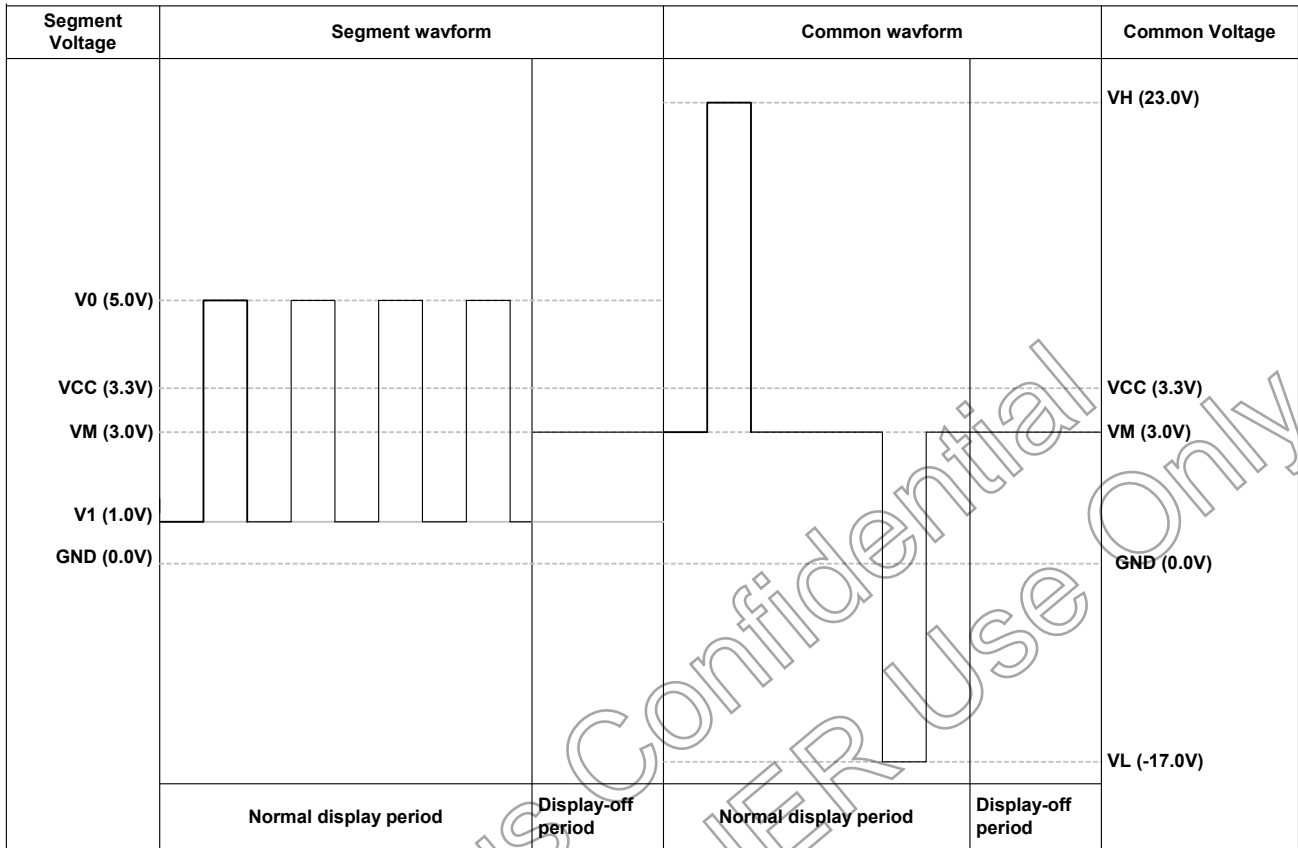

Relationship between the driver output waveform and each level voltage.

**Note2:** A current flowing in the input or output section is excluded. If an input signal is at an intermediate level for the CMOS, a through-current flows in the input circuit and power supply current increases. Therefore, V<sub>IH</sub> must be at the VCC level and V<sub>IL</sub> must be at the GND level.

**Note3:** Current at standby

**Note4:** The voltage of each signal is shown below.

**Note1:** A load must be 10pF or less for EI/O connection between drivers.

**Note2:** For output delay time 1 and 2, connect the load circuit shown below.

**8. APPLICATION CIRCUIT**

**Note1:** When designing the board, connect a capacitor near the IC to stabilize power supply. Use two capacitors of about 0.1 $\mu$ F for each IC (between VCC and GND, V0 and GND, VLCD and GND, and VEE and GND).

**Note2:** In addition, for the power supply circuit, connect a capacitor of several  $\mu$ F or several tens of  $\mu$ F between the liquid crystal power supply and GND. For set evaluation, confirm that there is no inversion of liquid crystal drive power supply and level power supply in the period between when the liquid crystal drive power supply is turned on and when it is turned off.

**Note3:** Configuring the LCD panel using the SPLC563A when using the select COMMON driver.
