GENERAL DESCRIPTION

The SSD1325 is a single-chip CMOS OLED/PLED driver with controller for organic/polymer light emitting diode dot-matrix graphic display system. It consists of 208 high voltage/current driving output pins for driving 128 segments and 80 commons. This IC is designed for Common Cathode type OLED/PLED panel.

The SSD1325 displays data directly from its internal 128x80x4 bits Graphic Display Data RAM (GDDRAM). Data/Commands are sent from general MCU through the hardware selectable 6800-/8080-series compatible Parallel Interface or Serial Peripheral Interface.

It has a 128-step contrast control and a 16 gray level control. The embedded on-chip oscillator and DC-DC voltage converter reduce the number of external components.

FEATURES

- Support max. 128 x 80 matrix panel
- Power supply: VDD=2.4V - 3.5V
VCC=8.0V - 16.0V
- OLED driving output voltage, 14V maximum
- DC-DC voltage converter
- Segment maximum source current: 300uA
- Common maximum sink current: 40mA
- Embedded 128 x 80 x 4 bit SRAM display memory
- External current reference
- 128 step contrast control on monochrome passive OLED panel
- 16 gray scale
- On-Chip Oscillator
- Programmable Frame Rate
- 8-bit 6800-series Parallel Interface, 8-bit 8080-series Parallel Interface, Serial Peripheral Interface.
- Row re-mapping and Column re-mapping
- Low power consumption (<5.0uA @sleep mode)
- Wide range of operating temperature: -40 to 85 °C

PIN DESCRIPTION

M, DOF#

These pins are No Connection pins. Nothing should be connected to these pins, nor they are connected together. These pins should be left open individually.

www.datasheet4u.com

CL

This pin is the system clock input. When internal clock is enabled, this pin should be left open. Nothing should be connected to this pin. In this case, the output clock frequency equals to the internal clock frequency. When internal oscillator is disabled, this pin receives display clock signal from external clock source.

M/S#

This pin is an input pin and must be pulled high to enable the chip function.

CLS

This pin is internal clock enable. When this pin is pulled high, internal clock is enabled. The internal clock will be disabled when it is pulled low, an external clock source must be connected to CL pin for normal operation.

BS0, BS1, BS2

These pins are MCU interface selection input. See the following table:

Table 3 - MCU interface setting

	6800-parallel interface	8080-parallel interface	Serial interface
BS0	0	0	0
BS1	0	1	0
BS2	1	1	0

CS#

This pin is the chip select input. The chip is enabled for MCU communication only when CS# is pulled low.

RES#

This pin is reset signal input. When the pin is low, initialization of the chip is executed.

D/C#

This pin is Data/Command control pin. When the pin is pulled high, the input at D₇-D₀ is treated as display data. When the pin is pulled low, the input at D₇-D₀ will be transferred to the command register. For detail relationship to MCU interface signals, please refer to the Timing Characteristics Diagrams.

R/W# (WR#)

This pin is MCU interface input. When interfacing to a 6800-series microprocessor, this pin will be used as Read/Write (R/W#) selection input. Pull this pin to "High" for read mode and pull it to "LOW" for write mode. When 8080 interface mode is selected, this pin will be the Write (WR#) input. Data write operation is initiated when this pin is pulled low and the CS# is pulled low.

E (RD#)

This pin is MCU interface input. When interfacing to a 6800-series microprocessor, this pin will be used as the Enable (E) signal. Read/write operation is initiated when this pin is pulled high and the CS# is pulled low. When connecting to an 8080-microprocessor, this pin receives the Read (RD#) signal. Data read operation is initiated when this pin is pulled low and CS# is pulled low.

www.datasheet4u.com

D₇-D₀

These pins are 8-bit bi-directional data bus to be connected to the microprocessor's data bus. When serial mode is selected, D₁ will be the serial data input SDIN and D₀ will be the serial clock input SCLK.

V_{DD}

This is a voltage supply pin. It must be connected to external source.

V_{SS}

This is a ground pin. It also acts as a reference for the logic pins and the OLED driving voltages. It must be connected to external ground.

V_{CC}

This is the most positive voltage supply pin of the chip. It can be supplied externally or generated internally by using internal DC-DC voltage converter.

V_{REF}

This pin is the voltage reference for pre-charge voltage in driving OLED device. Voltage should be set to match with the OLED driving voltage in current drive phase. It can be either supplied externally or connected to V_{CC}.

I_{REF}

This pin is segment current reference pin. A resistor should be connected between this pin and V_{SS}. Set the current at 10uA.

V_{COMH}

This pin is the input pin for the voltage output high level for COM signals. It can be supplied externally or internally. When V_{COMH} is generated internally, a capacitor should be connected between this pin and V_{SS}.

V_{SL}

This pin is the output pin for the voltage output low level for SEG signals. A capacitor should be connected between this pin and V_{SS}.

V_{SLCAP}

This pin is the output pin for the voltage output low level for SEG signals. A capacitor should be connected between this pin and V_{SS}.

V_{CL}

This pin is the output pin for the voltage output low level for COM signals. This pin should be connected to V_{SS}.

V_{DBB}

This is the power supply pin for the GDR pin buffer. It must be connected when the converter is used.

V_{SSB}

This is the GND pin for the GDR pin buffer. It must be connected when the converter is used.

GDR

This output pin drives the gate of the external NMOS of the booster circuit.

FB

This pin is the feedback resistor input of the booster circuit. It is used to adjust the booster output voltage level (Vcc).

www.datasheet4u.com

RESE

This pin connects to the source current pin of the external NMOS of the booster circuit.

VB_{REF}

This pin is the internal voltage reference of booster circuit. A stabilization capacitor should be connected between this pin and Vss for both internal and external VCC usage.

COM0-COM79

These pins provide the Common switch signals to the OLED panel. These pins are in high impedance state when display is off.

SEG0-SEG127

These pins provide the OLED segment driving signals. These pins are in high impedance state when display is off.

NC

These pins should be left open individually.

FUNCTIONAL BLOCK DESCRIPTIONS

Command Decoder

This module determines whether the input data is interpreted as data or command. Data is interpreted based upon the input of the D/C# pin.

www.datasheet4u.com

If D/C# pin is high, the input at D₇-D₀ is written to Graphic Display Data RAM (GDDRAM). If it is low, the input at D₇-D₀ is interpreted as a Command which will be decoded and be written to the corresponding command register.

MPU Parallel 6800-series Interface

The parallel interface consists of 8 bi-directional data pins (D₇-D₀), R/W#(WR#), D/C#, E (RD#), CS#. R/W#(WR#) input High indicates a read operation from the Graphic Display Data RAM (GDDRAM) or the status register. R/W# (WR#) input Low indicates a write operation to Display Data RAM or Internal Command Registers depending on the status of D/C# input. The E (RD#) input serves as data latch signal (clock) when high provided that CS# is low. Refer to Parallel Interface Timing Diagram of 6800-series microprocessors.

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 3 below.

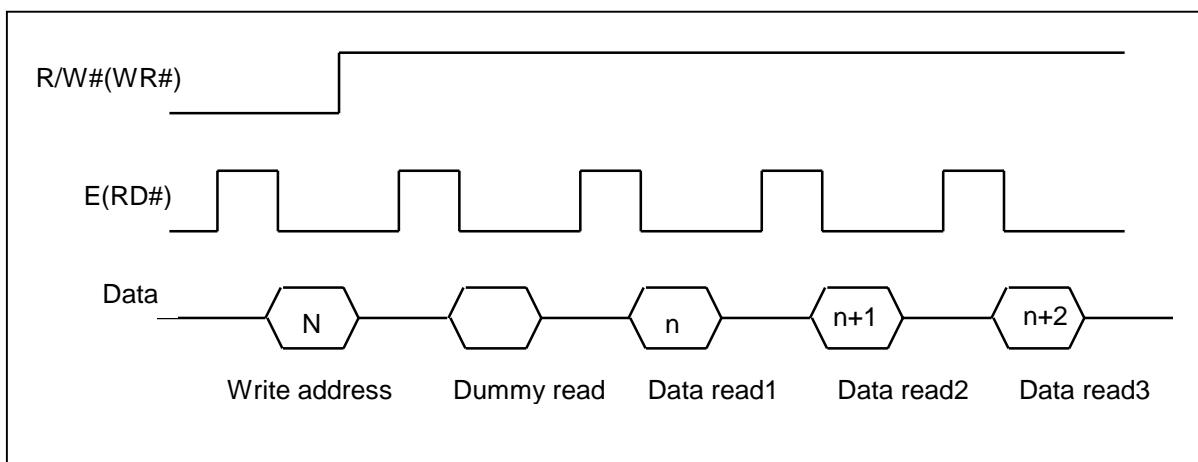

Figure 3 - Display Data Read Back Procedure - Insertion of Dummy Read

MPU Parallel 8080-series Interface

The parallel interface consists of 8 bi-directional data pins (D₇-D₀), E (RD#), R/W#(WR#), D/C#, CS#. The E (RD#) input serves as data read latch signal (clock) when it is low, and provided that CS# is low. Data read latch signal is disable when E (RD#) is high. Display data or status register read is controlled by D/C#. R/W# (WR#) input serves as data write latch signal (clock) when it is low and provided that CS# is low. Display data or command register write is controlled by D/C#. Refer to Parallel Interface Timing Diagram of 8080-series microprocessor. Similar to 6800-series interface, a dummy read is also required before the first actual display data read.

MPU Serial Interface

The serial interface consists of serial clock SCLK, serial data SDIN, D/C#, CS#. SDIN is shifted into an 8-bit shift register on every rising edge of SCLK in the order of D₇, D₆, ... D₀. D/C# is sampled on every eighth clock and the data byte in the shift register is written to the Display Data RAM or command register in the same clock.

Oscillator Circuit and Display Time Generator

www.datasheet4u.com

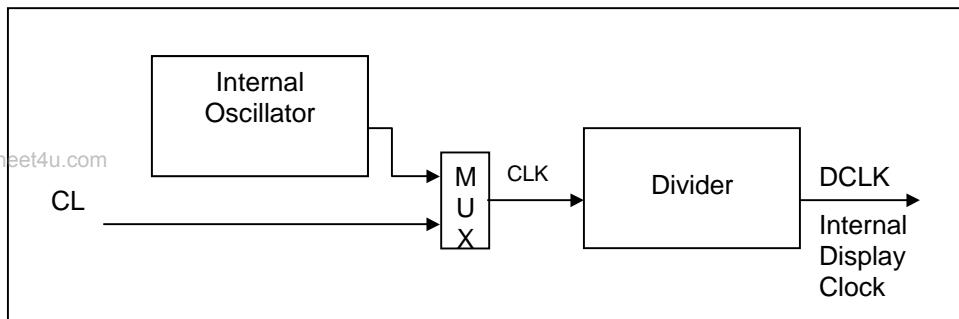

Figure 4 - Oscillator Circuit

This module is an On-Chip low power RC oscillator circuitry (Figure 4). The oscillator generates the clock for the Display Timing Generator.

Current Control and Voltage Control

This block is used to derive the incoming power sources into the different levels of internal use voltage and current. V_{CC} and V_{DD} are external power supplies. V_{REF} is reference voltage, which is used to derive driving voltage for segments and commons. I_{REF} is a reference current source for segment current drivers.

Segment Drivers/Common Drivers

Segment drivers deliver 128 current sources to drive OLED panel. The driving current can be adjusted from 0 to 300uA with 128 steps. Common drivers generate voltage scanning pulse.

Graphic Display Data RAM (GDDRAM)

The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 128x80x4 bits. For mechanical flexibility, re-mapping on both Segment and Common outputs can be selected by software. (Refer to Table 3-7 for GDDRAM address map description)

Table 4 – GDDRAM address map showing Horizontal Address Increment A[2]=0, Column Address Re-map A[0]=0, Nibble Re-map A[1]=0, COM Re-map A[4]=0, and Display Start Line=00H (Data byte sequence: D0, D1, ..., D5118, D5119)

Re-map A[1]=0, COM Re-map A[4]=1, and Display Start Line=16H (Data byte sequence: D0, D1, ..., D5118, D5119)

Table 8 – GDDRAM address map showing Horizontal Address Increment A[2]=0, Column Address Re-map A[0]=0, Nibble Re-map A[1]=0, COM Re-map A[4]=0, Display Start Line=00H (Data byte sequence: D0, D1, ..., D4834, D4835), Column Start Address=01H, Column End Address=3EH, Row Start Address=01H and Row End Address=4EH

The diagram illustrates the GDDRAM address map. It shows a 6x8 grid of memory locations. The columns are labeled SEG0, SEG1, SEG2, SEG3, (empty), SEG124, SEG125, SEG126, and SEG127. The rows are labeled COM0, COM1, |, COM78, and COM79. The first two rows (COM0 and COM1) have specific data values: COM0 has 00 in the first column and 01 in the second; COM1 has 01 in the first column and 00 in the second. Rows 3 through 5 (|, COM78, and COM79) have data values in the third and fourth columns: | has D0[3:0] and D0[7:4]; COM78 has D4774[3:0] and D4774[7:4]; COM79 has D4835[3:0] and D4835[7:4]. The fifth column is empty. The last three columns (SEG124, SEG125, SEG126, SEG127) have data values in the sixth, seventh, and eighth columns respectively: SEG124 has 3E in the sixth column; SEG125 has D61[3:0] and D61[7:4] in the seventh column; SEG126 has D4835[3:0] and D4835[7:4] in the eighth column; SEG127 has empty cells. Arrows point from the data values in the third and fourth columns to the corresponding SEG outputs in the last three columns. The first two rows (COM0 and COM1) have empty cells in the third and fourth columns.

Gray Scale Decoder

There are 16 gray levels from GS0 to GS15. The gray scale of the display is defined by the pulse width (PW) of current drive phase, GS0 has no pre-charge and no current drive. Each L value represents an offset to the corresponding gray scale level. See below table and graphical representation:

Table9 - Gray scale pulse width set table

	Description	Number of DCLKs
L1	Set GS1 level Pulse Width	0-7
L2	Set GS2 level Pulse Width Offset	1-8
L3	Set GS3 level Pulse Width Offset	1-8
.	.	.
.	.	.
.	.	.
L13	Set GS13 level Pulse Width Offset	1-8
L14	Set GS14 level Pulse Width Offset	1-8
L15	Set GS15 level Pulse Width Offset	1-8

DCLK: Internal Display Clock. It is used for defining phase clock period.

K: number of DCLKs

- [Light Gray Box] no precharge and current drive
- [Dark Gray Box] Precharge
- [White Box] Current Drive

Figure 5 - Gray scale pulse width set diagram

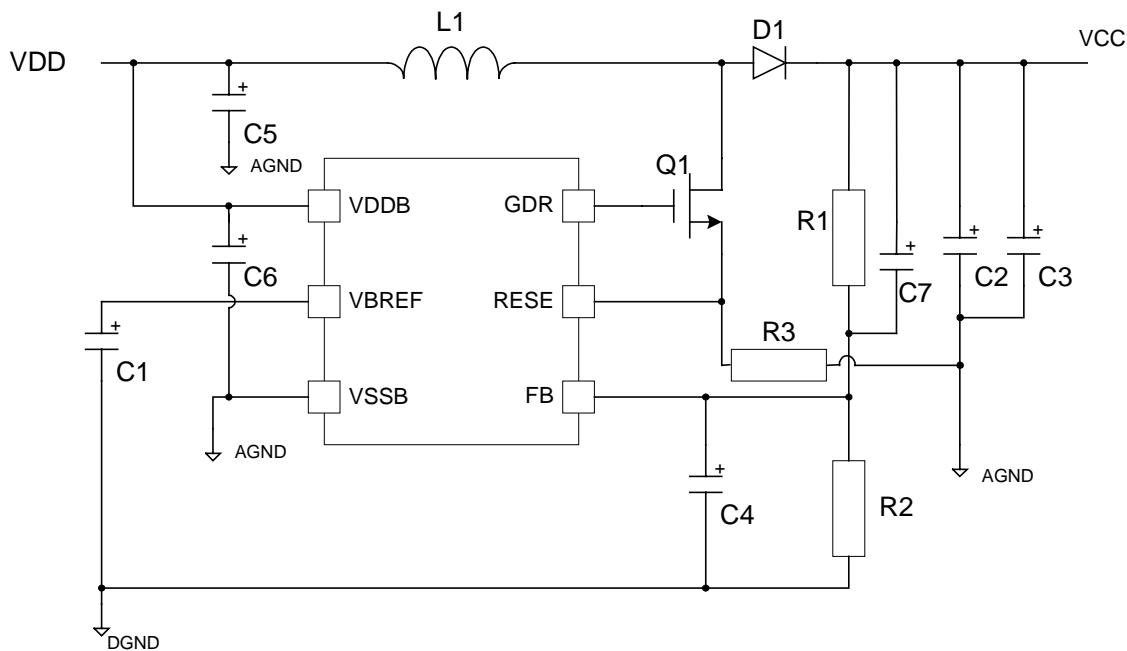

Table 10 - Gray scale pulse width default values

POR	Result
L1=1	GS1 level Pulse width=1
L2=1	GS2 level Pulse width=3
L3=1	GS3 level Pulse width=5
L4=1	GS4 level Pulse width=7
L5=1	GS5 level Pulse width=9
L6=1	GS6 level Pulse width=11

L10=1	GS10 level Pulse width=19
L11=1	GS11 level Pulse width=21
L12=1	GS12 level Pulse width=23
L13=1	GS13 level Pulse width=25
L14=1	GS14 level Pulse width=27
L15=1	GS15 level Pulse width=29

DC-DC Voltage Converter

It is a switching voltage generator circuit, designed for handheld applications. In SSD1325, internal DC-DC voltage converter accompanying with an external application circuit (shown in below figure) can generate a high voltage supply V_{CC} from a low voltage supply input V_{DD} . V_{CC} is the voltage supply to the OLED driver block. Below application circuit is an example for the input voltage of 3V V_{DD} to generate V_{CC} of 12V @20mA ~ 30mA application.

www.datasheet4u.com

Remark:

1. L1, D1, Q1, C5 should be grouped closed together on PCB layout.
2. R1, R2, C1, C4 should be grouped closed together on PCB layout.
3. The VCC output voltage level can be adjusted by R1and R2, the reference formula is:

$$V_{CC} = 1.2 \times (R_1 + R_2) / R_2$$
 The value of $(R_1 + R_2)$ should be between 500k to 1M Ohm.

Table 11 - Passive component selection:

Components	Typical Value	Remark
L1	Inductor, 22 μ H	2A
D1	Schottky diode	2A, 25V e.g. 1N5822
Q1	MOSFET	N-FET with low $R_{DS(on)}$ and low V_{th} voltage. e.g. MGSF1N02LT1 [ON SEMICONDUCTOR]
R1, R2	Resistor	1%, 1/10W
R3	Resistor, 1.5 Ω	1%, 1/2W
C1	Capacitor, 1 μ F	16V
C2	Capacitor, 22 μ F	Low ESR, 25V
C3	Capacitor, 1 μ F	16V
C4	Capacitor, 10nF	16V
C5	Capacitor, 1 ~ 10 μ F	16V
C6	Capacitor, 0.1 ~ 1 μ F	16V
C7	Capacitor, 15nF	16V

COMMAND TABLE

Table 12 - Command Table

Table 13 - Read Command Table

(D/C#=0, R/W#(WR#)=1, E(RD#)=1 for 6800 or E(RD#)=0 for 8080)

D ₇ D ₆ D ₅ D ₄ D ₃ D ₂ D ₁ D ₀	Status Register Read	D7 = 0:reserved D7 = 1:reserved D6 = 0:indicates the display is ON D6 = 1:indicated the display is OFF D5 = 0:reserved D5 = 1:reserved D4 = 0:reserved D4 = 1:reserved
---	----------------------	---

Note: Patterns other than that given in Command Table are prohibited to enter to the chip as a command;
Otherwise, unexpected result will occur

Data Read / Write

To read data from the GDDRAM, input High to R/W# (WR#) pin and D/C# pin for 6800-series parallel mode, Low to E (RD#) pin and High to D/C# pin for 8080-series parallel mode.

In horizontal address increment mode, GDDRAM column address pointer will be increased by one automatically after each data read. In vertical address increment mode, GDDRAM row address pointer will be increased by one automatically after each data read.

Also, a dummy read is required before the first data read. See Figure 3 in Functional Description.

To write data to the GDDRAM, input Low to R/W#(WR#) pin and High to D/C# pin for 6800-series parallel mode and 8080-series parallel mode. For serial interface mode, it is always in write mode. In horizontal address increment mode, GDDRAM column address pointer will be increased by one automatically after each data write. In vertical address increment mode, GDDRAM row address pointer will be increased by one automatically after each data write.

It should be noted that, in horizontal address increment mode, the row address pointer would be increased by one automatically if the column address pointer wraps around. In vertical address increment mode, the column address pointer will be increased by one automatically if the row address pointer wraps around.

Table 14 - Address Increment Table (Automatic)

D/C#	R/W# (WR#)	Comment	Address Increment
0	0	Write Command	No
0	1	Read Status	No
1	0	Write Data	Yes
1	1	Read Data	Yes

COMMAND DESCRIPTIONS

Set Column Address

This command specifies column start address and end address of the display data RAM. This command also sets the column address pointer to column start address.

www.datasheet4u.com

Set Row Address

This command specifies row start address and end address of the display data RAM. This command also sets the row address pointer to row start address.

Set Contrast Control Register

This command is to set Contrast Setting of the display. The chip has 128 contrast steps from 00H to 7FH. The segment output current increases linearly with the increase of contrast step. See Figure 6 below.

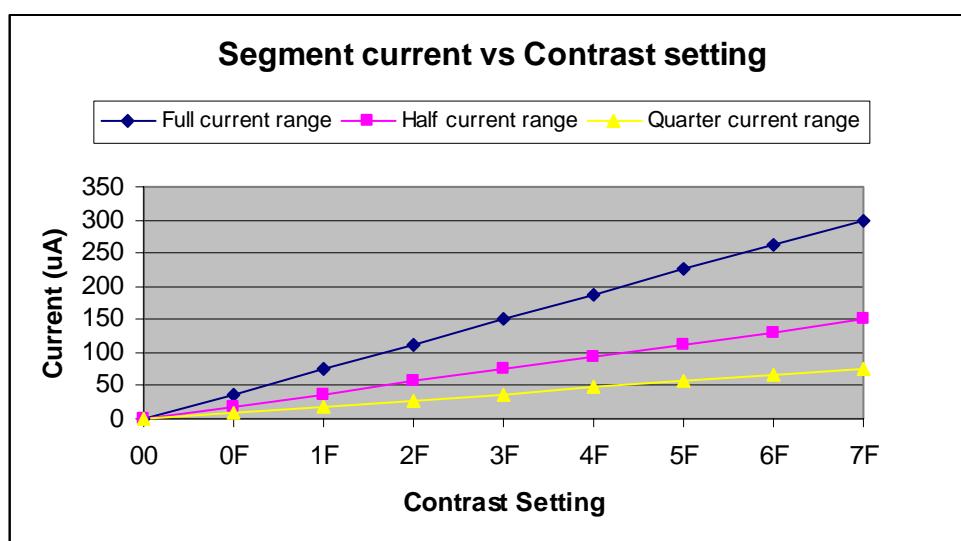

Figure 6 - Segment current vs Contrast setting

Set Current Range

This command is used to select quarter range or half range or full range current mode. With the same contrast level, quarter range mode will give a quarter of the current output of the full range mode. Similar to half range current mode, it will give a half of the current output of the full range mode. See Figure 6. In POR, quarter range current mode is default.

Set Re-map

This command changes the mapping between the display data column address and segment driver, row address and common driver. It allows flexibility in layout during OLED module assembly. See the Re-map setting below:

Column Address Re-map

If column address re-map is set, Col 0-63 map to SEG127-0, regardless of start column and end column commands.

Nibble Re-map

If nibble re-map is set, the two nibbles of the data bus for RAM access are re-mapped, such that (D7, D6, D5, D4, D3, D2, D1, D0) acts like (D3, D2, D1, D0, D7, D6, D5, D4)

This feature working with Column Address Re-map would produce an effect of flipping outputs SEG0-127 to SEG127-SEG0.

Address Increment Mode

If horizontal increment mode is set, the column address pointer advances after each RAM access.

If vertical increment mode is set, the row address pointer advances after each RAM access.

www.datasheet4u.com

COM Re-map

If COM re-map is set, ROW 0-79 map to COM79-0, regardless of start and end row commands.

Set Display Start Line

This command is to set Display Start Line register to determine starting address of display RAM to be displayed by selecting a value from 0 to 79.

Set Display Offset

This is a double byte command. The next command specifies the mapping of display start line (it is assumed that COM0 is the display start line, display start line register equals to 0) to one of COM0-79.

For example, to move the COMX towards the COM0 direction for L lines, the 7-bit data in the second command should be given by L. In other words, to move the COMX towards the COM79 direction for L lines, the 7-bit data in the second command should be given by 80-L.

Set Display Mode

This command is used to set Normal Display, Entire Display On, Entire Display Off and Inverse Display. Set Entire Display On forces the entire display to be at gray level "GS15" regardless of the contents of the display data RAM. Set Entire Display Off forces the entire display to be at gray level "GS0" regardless of the contents of the display data RAM. Normal Display will turn the data to ON at the corresponding gray level. Inverse display will turn the data as follow:

Table 15 - Mapping of data with each gray scale level at different display mode

Data D _{X4} D _{X3} D _{X2} D _{X1}	Normal Display (A4H)	Entire Display On (A5H)	Entire Display Off (A6H)	Inverse Display (A7H)
0000	GS0	GS15	GS0	GS15
0001	GS1	GS15	GS0	GS14
0010	GS2	GS15	GS0	GS13
0011	GS3	GS15	GS0	GS12
0100	GS4	GS15	GS0	GS11
0101	GS5	GS15	GS0	GS10
0110	GS6	GS15	GS0	GS9
0111	GS7	GS15	GS0	GS8
1000	GS8	GS15	GS0	GS7
1001	GS9	GS15	GS0	GS6
1010	GS10	GS15	GS0	GS5
1011	GS11	GS15	GS0	GS4
1100	GS12	GS15	GS0	GS3
1101	GS13	GS15	GS0	GS2
1110	GS14	GS15	GS0	GS1
1111	GS15	GS15	GS0	GS0

Set Multiplex Ratio

This command sets multiplex ratio from 16 to 80. In POR, multiplex ratio is 80.

Set DC-DC Converter

This command is used to enable or disable the internal DC-DC voltage converter. This command will be executed when display is on.

Set Display On/Off

This command turns the display on or off. When the display is off, the segment and common output are in high impedance state.

Set V_{COMH} Voltage

This command is used to set V_{COMH} voltage level

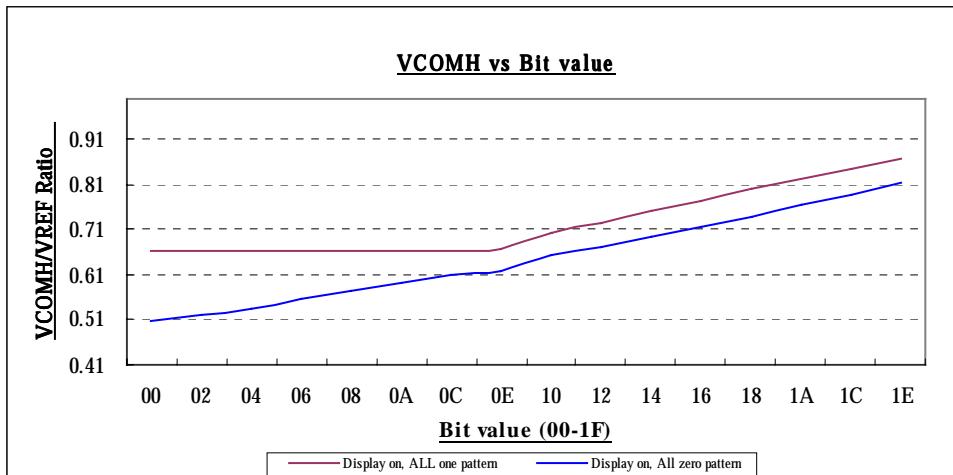

Figure 7 - VCOMH vs Bit value

Set Precharge Voltage

This command is used to set Precharge Voltage level

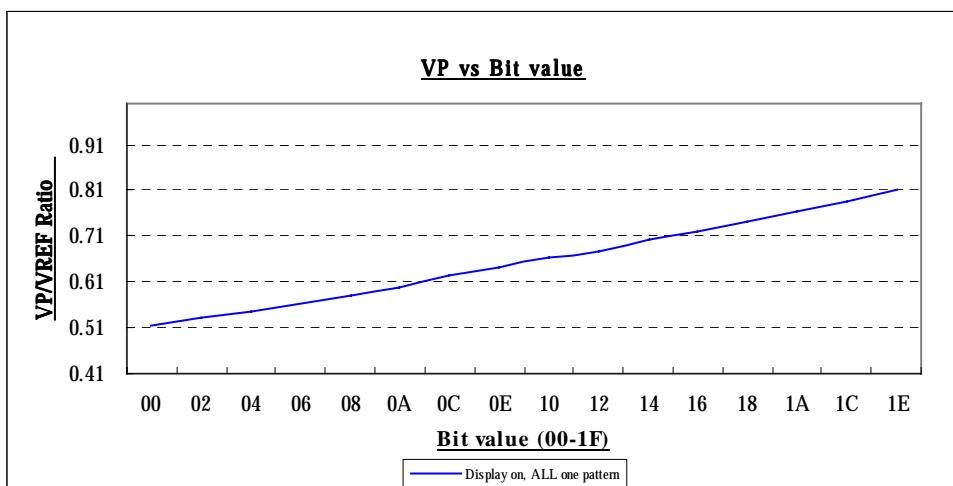

Figure 8 - VP vs Bit value

Set Phase Length

This is a double byte command. The lower nibble of the second byte selects phase 1 period (no pre-charge and current drive) from 1 to 16 DCLKs. POR is A[3:0]=3d. The higher nibble of the second byte is used to select phase 2 period (pre-charge) from 1 to 16 DCLKs. POR is A[7:4]=5d.

www.datasheet4u.com

Set Row Period

This command is used to set the row period. It is defined by multiplying the internal display clock period by the number of internal display clocks per row (Value from 2-158d). POR is 37d. The larger the value, the more precise of each gray scale level can be tuned. See "Gray Scale Table" command for details. Also, It is used to define the frame frequency with the use of "Display Clock Divide Ratio" command together.

Row period equals to the sum of phase 1, 2 periods and the pulse width of GS15. See equation in command table on page 12.

Set Display Clock Divide Ratio

This command is used to set the frequency of the internal display clocks, DCLKs. It is defined by dividing the oscillator frequency by the divide ratio (Value from 1 to 16). POR is 2. Frame frequency is determined by divide ratio, number of display clocks per row, MUX ratio and oscillator frequency. See equation on page 12.

Set Oscillator Frequency

This is a double byte command. The lower nibble of the second byte is used to select the oscillator frequency. Default value is shown in Table 12.

Set Gray Scale Table

This command is used to set the gray scale table for the display. Except GS0, which has no pre-charge and current drive, each GS level is programmed by a set of offset values. As shown in Table 8, GS1 is defined with pulse width equals to the first offset value, L1, select from 0-7 internal display clocks. GS2 is defined with pulse width equals to GS1 plus the next offset value, L2, select from 1-8 internal display clocks. Similarly, the next GS level is defined with pulse width equals to its lower one GS level plus the next offset value, select from 1-8 internal display clocks. In normal operation, GS15 should take the full current drive period as its pulse width. Therefore, the row period should be set as the sum of phase 1 period, phase 2 period, and the pulse width of GS15 with the use of "Row period" command.

NOP

No Operation Command.

Status register Read

This command is issued by setting D/C# low during a data read (refer to Figure 9 and Figure 10 parallel interface waveform). It allows the MCU to monitor the internal status of the chip.

MAXIMUM RATINGS

Table 16 - Maximum Ratings

(Voltage Reference to V_{SS})

Symbol	Parameter	Value	Unit
V_{DD}	Supply Voltage	-0.3 to +4	V
V_{CC}		0 to 16	V
V_{REF}		0 to 16	V
V_{COMH}	Supply Voltage/Output voltage	0 to 16	V
-	SEG/COM output voltage	0 to 16	V
V_{in}	Input voltage	V_{SS} -0.3 to V_{DD} +0.3	V
T_A	Operating Temperature	-40 to +85	°C
T_{stg}	Storage Temperature Range	-65 to +150	°C

*Maximum Ratings are those values beyond which damage to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description.

DC CHARACTERISTICS

Table 17 - DC Characteristics

(Unless otherwise specified, Voltage Referenced to V_{SS} , $V_{DD} = 2.4$ to $3.5V$, $T_A = 25^{\circ}C$)

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit

SSD1325T3R1 Pin Assignment

www.datasheet4u.com

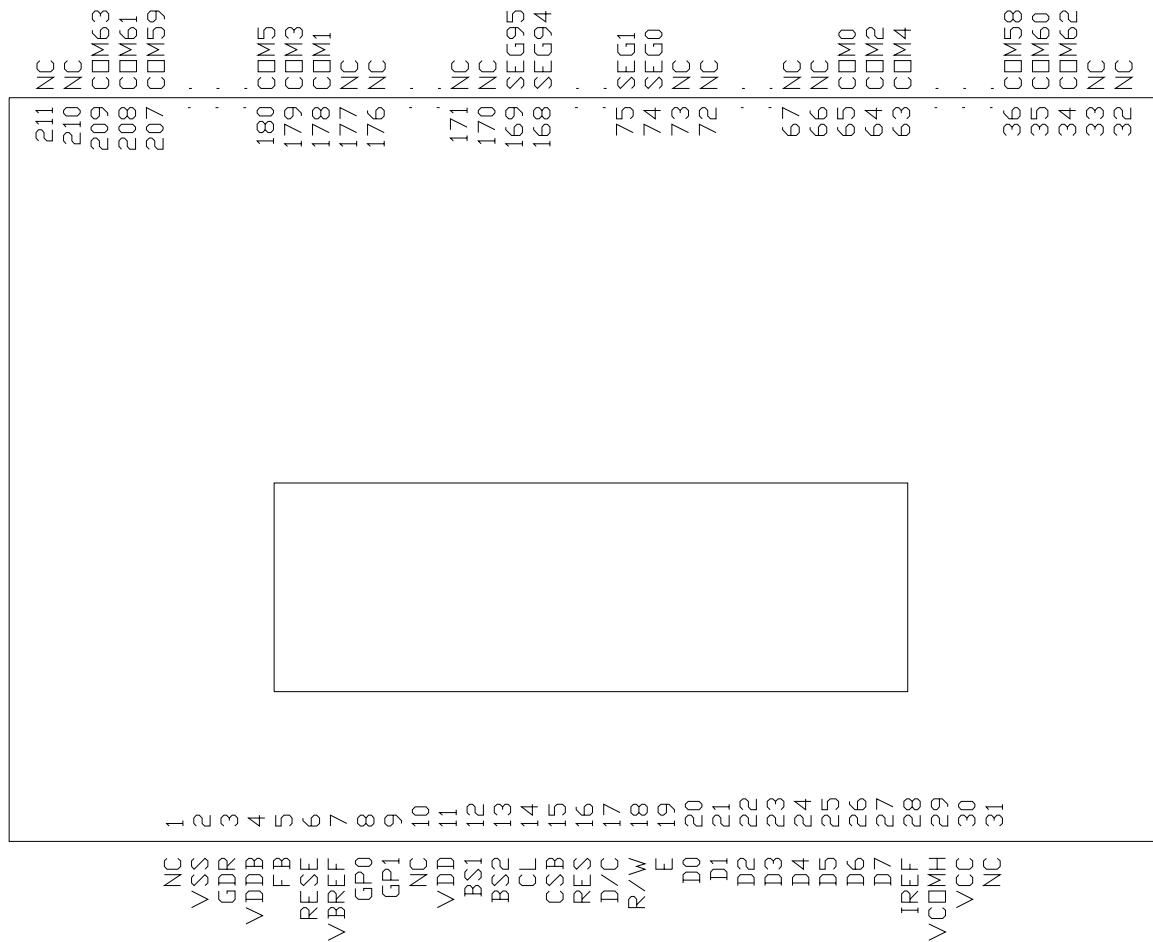

Figure 14 - SSD1325T3R1 pin assignment (Copper view, Normal TAB design)

Remark:

1. Use internal clock
2. VREF connect to VCC
3. VSSB, BGGND connect to VSS
4. BS0 connect to VSS
5. Support 6800, 8080, and SPI modes

Table 24 - SSD1325T3R1 pin assignment (enabled COM odd-even in "Set Re-map" command)

Solomon Systech reserves the right to make changes without further notice to any products herein. Solomon Systech makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Solomon Systech assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters can and do vary in different applications. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Solomon Systech does not convey any license under its patent rights nor the rights of others. Solomon Systech products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Solomon Systech product could create a situation where personal injury or death may occur. Should Buyer purchase or use Solomon Systech products for any such unintended or unauthorized application, Buyer shall indemnify and hold Solomon Systech and its offices, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Solomon Systech was negligent regarding the design or manufacture of the part.
