

TELETEXT DECODER WITH 8 INTEGRATED PAGES

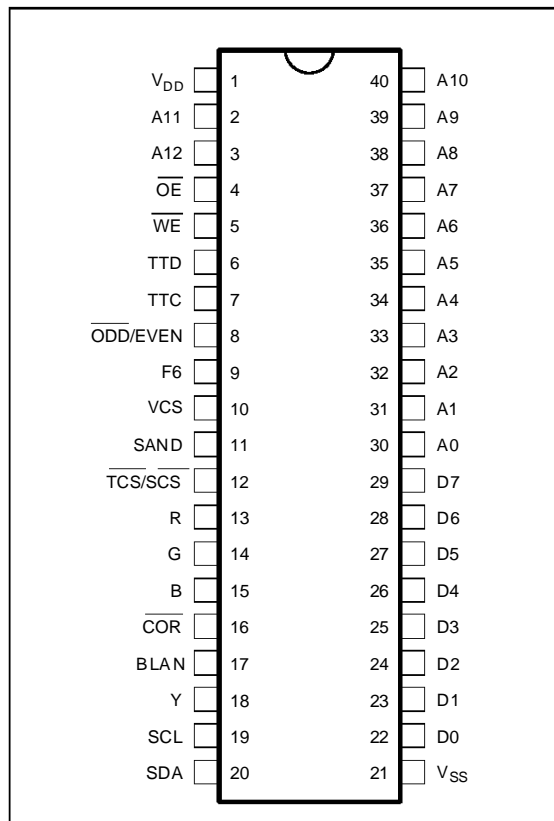

- COMPLETE TELETEXT DECODER INCLUDING ON-CHIP 8 PAGES MEMORY, REDUCING EMC RADIATIONS
- UPWARD SOFTWARE AND HARDWARE COMPATIBLE WITH PREVIOUS SGS-THOMSON's DECODER SDA5243
- DIRECT INTERFACE TO AN EXTERNAL STATIC RAM OF 8kBYTES FOR UP TO 16 PAGES APPLICATION
- AUTOMATIC SELECTION OF UP TO SIX NATIONAL LANGUAGES
- FOUR SIMULTANEOUS PAGE REQUESTS
- DISPLAY OF THE 25TH STATUS ROW
- MICROPROCESSOR CONTROL VIA AN I²C BUS (SLAVE ADDRESS 0010001 R/W)
- DATA ACQUISITION AVAILABLE FROM LINES 2 TO 22 OR FROM A COMPLETE FIELD
- HIGH QUALITY DISPLAY USING A CHARACTER MATRIX OF 12 x 10 DOTS
- SINGLE + 5V SUPPLY VOLTAGE
- ON-CHIP MASK PROGRAMMABLE ROM CHARACTER GENERATORS
- HCMOS PROCESS

DESCRIPTION

The STV5345 is a HCMOS integrated circuit which performs all the processing of logical data within a 625 lines system teletext decoder. It is designed to operate in conjunction with one-chip : the SAA5231 integrated chip which extracts Teletext information embedded in a composite video signal. Up to 8 pages of display data can be stored in internal memory. Using 8Kbytes of external memory leads to a 16 pages application. A complete system also comprises a microprocessor controlling the STV5345 via a 2-wires serial bus. An on-chip ROM memory contains the character sets. The STV5345 performs automatic selection of one of up to six natural languages. Data bytes may be decoded in either 7-Bit plus parity or in full 8-Bit formats. The chip set also supports facilities for reception and display of higher-level protocol data.

PIN CONNECTIONS

5345-01.EPS

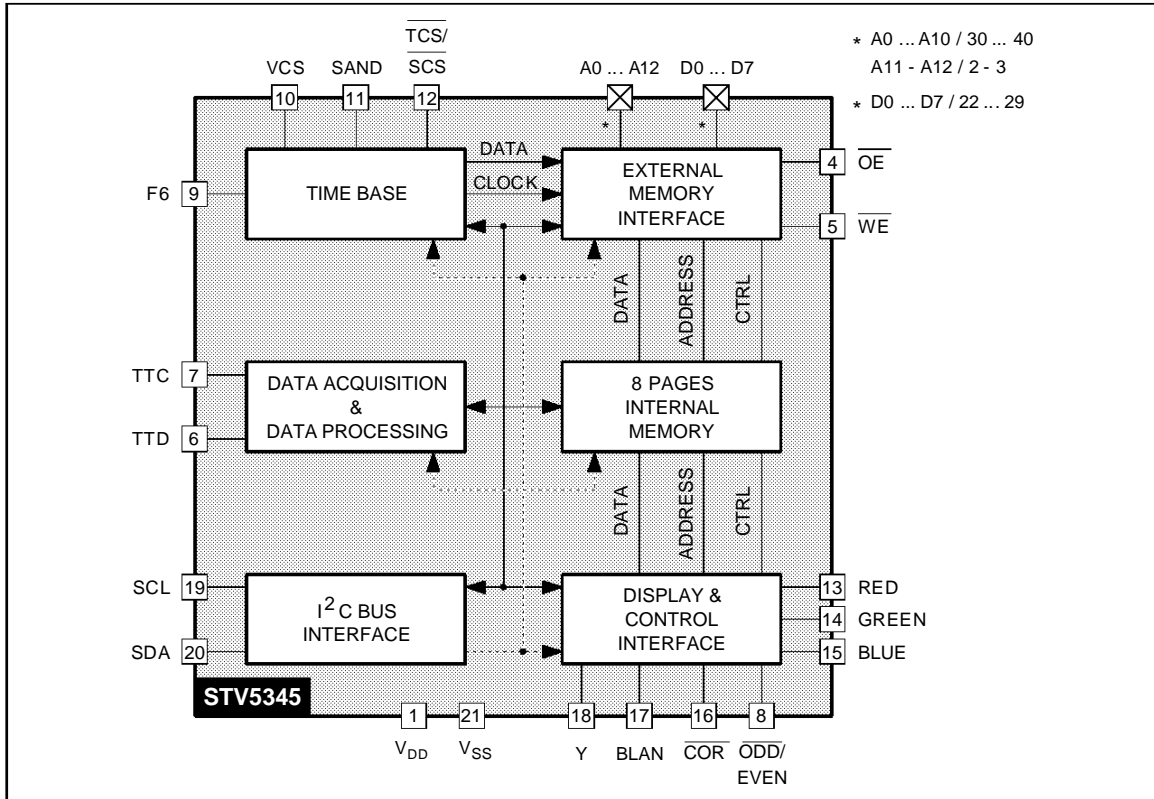

PIN DESCRIPTION

Pin	Symbol	Function	Description
1	V _{DD}	+5V	Positive supply voltage
2,3,40 *	A11, A12, A10	Chapter address	Address selection outputs for 1 of 8 external static RAM chapters each of 1 kBytes.
4 *	$\overline{\text{OE}}$	Output enable	Active-low external static RAM output enable control signal.
5 *	$\overline{\text{WE}}$	Write enable	Active-low external static RAM write enable control signal. It supports write-cycles interleaved with read-cycles.
6	TTD	Teletext data input	An A.C. coupled teletext data input supplied by the SAA5231 chip is latched to V _{SS} between 4 and 8 μ s after each TV line.
7	TTC	Teletext clock input	A 6.9375MHz clock signal, supplied by the SAA5231 chip, is internally A.C. coupled, clamped and buffered.
8	$\overline{\text{ODD/EVEN}}$	Interlaced mode state output	High for even numbered and low for odd-numbered frames. The value is valid 2 μ s before the end of lines 311 and 624.
9	F6	Character display clock signal	The 6MHz clock signal, supplied by the SAA5231 chip is internally A.C. coupled, clamped and buffered.
10	VCS	Video composite synchronization input signal	Active high VCS input.
11	SAND	Sandcastle	Three level output pulse to the SAA5231 device. Phase lock, blanking signal, and color burst components are contained in this signal.
12	$\overline{\text{TCS/SCS}}$	Input / output composite synchronization signal	Scan composite input signal (SCS) for the display synchronization or Text composite sync. (TCS) output signal to the SAA5231. Both signals are active low.
13,14,15	R G B	Red, green, blue	Character and background colors active-high open-drain outputs.
16	$\overline{\text{COR}}$	Contrast reduction	Open-drain active-low output supporting optimal display of characters in "mixed mode" operation.
17	BLAN	Blanking signal output	Open-drain active high output for TV-image blanking in normal and mixed-mode operation.
18	Y	Foreground output	Open-drain active-high output with foreground information. Can be used for printer command.
19	SCL	Serial clock	Microprocessor clock input via serial bus.
20	SDA	Serial data input / output	Open-drain microprocessor serial data input/output via serial bus.
21	V _{SS}	0 Volt	Ground.
22-29 *	D0-D7	Parallel data input / output	Eight tri-state input/output for data read/write from/to an external static RAM.
30-39 *	A0-A9	Address signals	Ten addresses output pins for accessing to individual Bytes of a 1 kByte chapter stored in an external Static RAM.

5345-01.TBL

* Pins only activated when 8KBytes of external memory are addressed, otherwise pins $\overline{\text{OE}}$ and $\overline{\text{WE}}$ remain high, and others remain low.

APPLICATION NOTES

ORGANIZATION OF A PAGE-MEMORY

The organization of a page-memory is shown in Figure 10.

The STV5345 chip provides a display format of 25 rows of 40 characters per row.

The organization is as follows :

Row zero contains the page header.

The first seven characters (0 - 6) are used for messages regarding the operational status.

The eighth character is an alphanumeric control character either "white" or "green" defining the "search" status of the page. When it is "white" the operational state is normal and the header appears

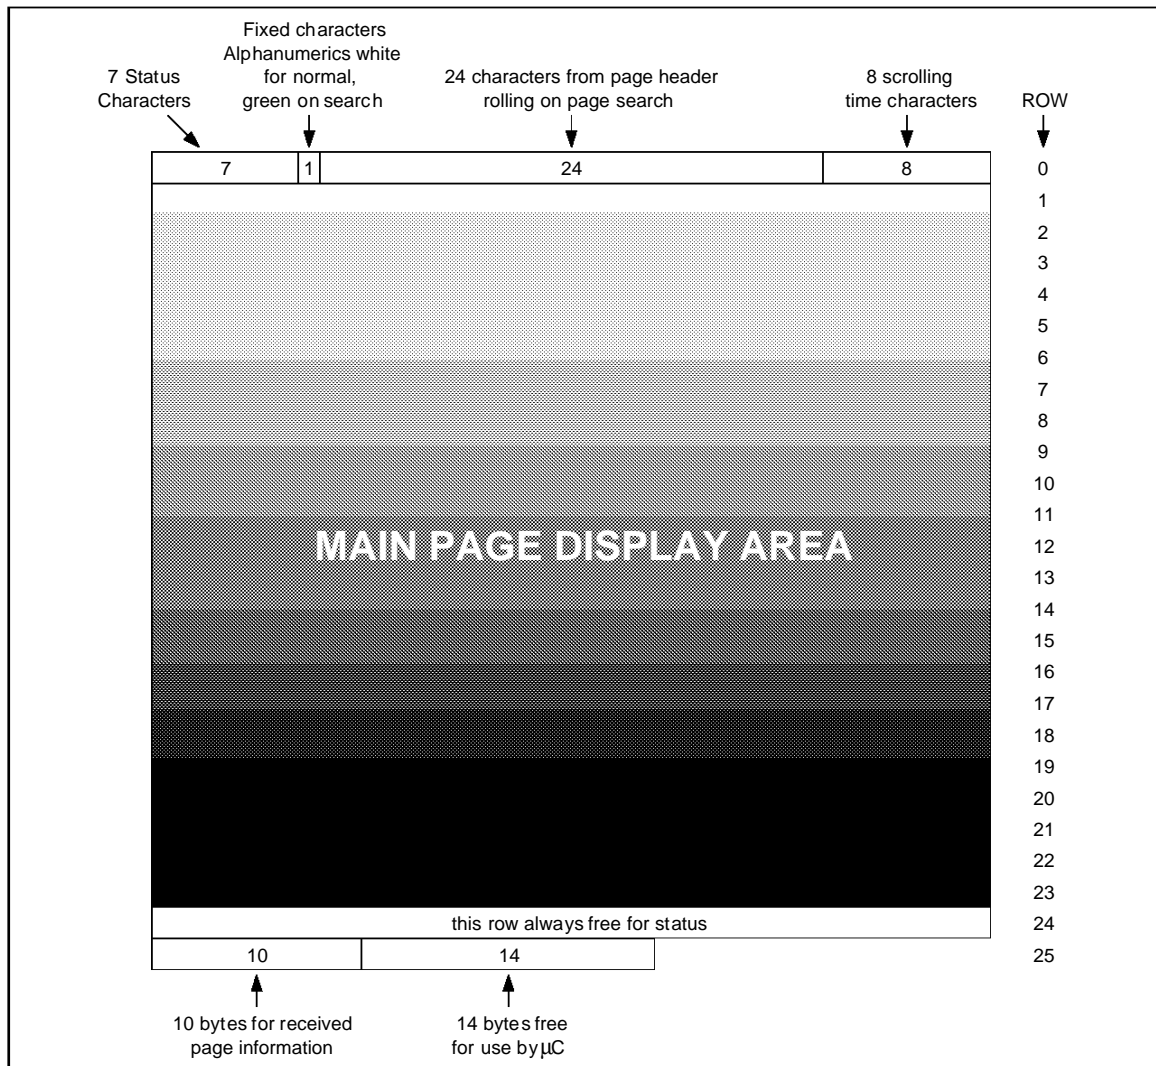

white ; when it is "green" the operational state corresponds to "search mode" and the header appears green. The following twenty-four characters give the header of the requested page when the system is in search mode. The last eight characters display the time of day.

Row number twenty-four is used by the microprocessor for the display of information.

Row twenty-five comprises ten bytes of control data concerning the received page (see Table 1) and fourteen free bytes which can be used by the microprocessor.

COLUMN	0	1	2	3	4	5	6	7	8	9

Page number : - MAG = magazine, PU = page units, PT = page tens.
Page sub-code : - MU = minutes units, MT = minutes tens, HU = hours units, HT = hours tens.
PBLF = page being looked for, FOUND = low for page found, HAM = hamming error in byte, C4-14 = control bits.

5345-08.TBL

REGISTER MAP (see Table 2)

Registers R0 to R10 and R12 are write only whilst R11A is a read/write and R11B is a read only register respect to the microprocessor.

The automatic succession on a byte basis is indicated by the arrows in Table 2.

In the normal operating mode TA, TB and TC should be set to logic level 0.

After power-up the contents of the registers are as

follows : all bits in registers R0 to R12 are cleared to zero with the exception of bits D0 and D1 in registers R5 and R6 which are set to logical one.

After power-up all the memory bytes are preset to hexadecimal value 20 H (space) with the exception of the byte corresponding to row 0 of column 7 of chapter 0 which is set to the value corresponding to "alpha white" hexadecimal value 07 H.

REFRESH ON DISPLAY FUNCTION

This function allows independently to fill the memory using 3 acquisition circuits when the 4th one refreshes the displayed page.

When EROD (D5 of Reg. 12) is 0, refresh on display function is not active. Four teletext pages are filled into memory corresponding to addresses of acquisition registers.

Two blocks of 8 pages are selected with A3 (D7 of Reg. 2)

Upper or lower bank of 4 pages is selected with A2 (D6 of Reg. 2).

Acquisition circuits are selected with A1/A0 (D5/D4 of Reg. 2). This 2 bits also determine the 1KByte of RAM (the chapter) allocated to each acquisition

circuit.

When EROD = 1, refresh on display function is active.

3 acquisition circuits store pages as described above. The 4th one stores data into the current displayed chapter. The chapter is selected with addresses A3/A2/A1/A0 (D3/D2/D1/D0 of Reg. 4). Notice that A1/A0 (D1/D0 of Reg. 4) give the circuit number to be used to refresh this displayed chapter. That means A1/A0 of refresh on display function (D4/D3 of Reg. 12) have to be written identical to A1/A0 (D1/D0 of Reg. 4), as A2 of acquisition circuit (D6 of Reg. 2) has to be identical to A2 of displayed chapter (D2 of Reg. 4).

5345-09.TBL

REGISTER FUNCTIONS

Register	Function	Bit(s)	Description
R0 Address 00H	R11 addressing and pin functions control	SEL 11B (D0)	Selection of register 11B (D0 = 1) or 11A (D0 = 0)
		TC (D1)	Test bit, must be cleared in the normal working mode
		EVEN OFF (D2)	Control of ODD/EVEN pin : EVEN signal output (D2 = 0) or grounded (D2 = 1)
R1 Address 01H	Operating mode controls	T1 T0 0 0 0 1 1 0 1 1	312/313 line MIX - mode with interlace 312/313 line TEXT - mode without interlace 312/312 line Terminal mode without interlace External synchronization TCS/SCS is an input
		TCS ON (D2)	D2 = 1, TCS output on Pin $\overline{TCS/SCS}$ D2 = 0, SCS input on Pin TCS/SCS
		\overline{DEW} / FULLFIELD (D3)	Selection of field flyback mode or full channel mode (D3 = 1)
		GHOST ROW ENABLE (D4)	Selection of ghost row mode (D4 = 1)
		ACQUISITION ON / OFF (D5)	Control of acquisition operation (D5 = 0 enables acquisition)
		$\overline{7\text{ bits} + \text{parity}}$ or 8 bits without parity (D6)	Selection of received data format either 7 bits with parity (D6 = 0) or 8 bits without parity (D6 = 1).
		TA (D7)	Test bit, must be cleared in the normal working mode
R2 Address 02H	Addressing information for a page request	SC0, SC1, SC2 (D0, D1, D2)	Address the first column of the on chip page request RAM to be written.
		TB (D3)	Test bit, must be cleared in the normal working mode.
		A0, A1 (D4, D5)	Address a group of four consecutive pages currently used for data acquisition;
		A2 (D6)	Address of one of the two groups of four pages for acquisition in normal mode.
R3 Address 03H	Data relative to the requested page (see Table 3)	A3 (D7)	Block select: D7 = 0 internal memory, D7 = 1 external memory
		PRD0 - PRD4 (D0 - D4)	Written data in the page request RAM, starting with the columns addressed by SC0, SC1, SC2.
		A0, ... A3 (D0, ... D3)	These 4 bits correspond to the logical states of the 4 address lines (A10, ... A13) during memory read cycles.
R5 Address 05H	Display control for normal operation	PON (D0, D1)	Picture on (IN: D0, OUT: D1)
		TEXT (D2, D3)	Text on (IN: D2, OUT: D3)
		\overline{COR} (D4, D5)	Contrast reduction on (IN: D4, OUT: D5)
		BKGND (D6, D7)	Background colour on (IN: D6, OUT: D7)
		IN / OUT	Enable inside/outside the box
R6 Address 06H	Display control for news-flash subtitle generation	See R5	See R5
R7 Address 07H	Display mode	BOX ON 0, 1-23, 24 (D0, D1, D2)	The "boxing" function is enabled on row 0, 1-23 and 24 by D0, D1 and D2 set to one.
		$\overline{TOP/BOTTOM}$ Single/Double Height (D4/D3)	X0 = Normal 01 = double height Rows 0 to 11 11 = double height Rows 12 to 23
		Conceal/Reveal (D5)	Conceal Reveal Function
		Cursor ON/OFF (D6)	Cursor position given by row/column value of R9/R10
		$\overline{STATUS\ ROW}$ BTM / TOP (D7)	The 25th row is displayed before the "Main text Area" (lines 0-23) or after (D7 = 0).

5345-10.TBL

REGISTER FUNCTIONS (continued)

Register	Function	Bit(s)	Description
R8 to R11A Address 08H to 0BH*	Active chapter address (R8), active row address (R9), active column address (R10). Data contained in R11A read (written) from (to) memory by microprocessor via I ² C.		
R11B Address 0BH*	Status	VCS Signal Quality (D0)	Good VCS quality signal detected (D0 = 1) or disturbed (D0 = 0)
		60Hz (D7)	VCS received with 60Hz frequency (D7 = 1) or 50Hz (D7 = 0). Only valid when VCS is good (D0 = 1)
R12 Address 0CH	Page request address	A0, A1 (D3, D4)	A0, A1 addresses of displayed page to refresh when using refresh on display function
		EROD (D5)	Enable refresh on displayed page function when = 1 normal acquisition storage if EROD = 0

* Reading of R11A or R11B is determined by register 0, bit D0. Nevertheless, write operation is always performed on R11A register.

Table 3 : Register R3

START COLUMN	PRD4	PRD3	PRD2	PRD1	PRD0
0	Do care magazine	HOLD	MAG2	MAG1	MAG0
1	Do care page tens	PT3	PT2	PT1	PT0
2	Do care page units	PU3	PU2	PU1	PU0
3	Do care hours tens	X	X	HT1	HT0
4	Do care hours units	HU3	HU2	HU1	HU0
5	Do care minutes tens	X	MT2	MT1	MT0
6	Do care minutes units	MU3	MU2	MU1	MU0

The abbreviations have the same significance as in Table 1 with the exception of the "DO CARE" entries. It is only when this bit is "1" that the corresponding digit is taken into consideration on page request. For example, a page defined as "normal" or one defined as "timed" may be selected.
If "HOLD" is low the page is held. The addressing of successive bytes via the I²C bus is automatic.

CHARACTER SETS

The complete character set with 8-bit decoding is given in Tables 4a, 4b and 4c.

Characters in columns 0 and 1 are normally displayed as blanks. Black dots represent the character shape whereas white dots represent the background.

Each character can be identified by a pair of corre-

sponding row and column integers : for example the character "3" may be indicated by 3/3.

A rectangle may be represented as follows :

The characters 8/6, 8/7, 9/5, 9/7 are used as special characters, always in conjunction with 8/5.

The 13 national characters are placed in columns with bit 8 = 0.

Table 4a : Complete character set (with 8 bit codes) - West European Languages (STV5345)

Case using C12 C13 C14 = 001 (German Set)

* These control characters are reserved for compatibility with other data codes.
 ** These control characters are presumed before each row begins

The basic set of the 96 characters is shown in Table 5. The location of the 13 national characters

are shown in Table 5 whilst full national character sets are depicted in Tables 6, 7 and 8.
