This product datasheet contains a detailed description of the SX1242 performance and functionality.

1. General Description

The SX1242 is a fully-integrated multi-band, single chip transmitter IC capable of OOK modulation of an input data stream. The SX1242 is configured, by default, to operate without a microcontroller at a pre-configured RF setting of 344.940 MHz.

Another key feature of the SX1242 is its low current consumption in transmit and sleep modes and its wide voltage operating range from 1.8 V to 3.7 V. This makes the SX1242 suitable for low-cost battery chemistries or energy harvesting applications.

The internal architecture of the SX1242 is shown in Figure 1. The SX1242 comprises a low-consumption PLL and power amplifier. OOK Modulation is performed via ramping of the PA reference DAC.

The SX1242 is designed for use with a variety of low-cost antenna technologies including PCB-etched loop or electrically-short stub.

Further application information may be found in Section 4.

2. Electrical Characteristics

2.1. ESD Notice

The SX1242 is a high performance radio frequency device, and satisfies Class 2 of the JEDEC standard JESD22-A114-B (human body model) on all pins.

It should thus be handled with all necessary ESD precautions to avoid any permanent damage.

2.2. Absolute Maximum Ratings

Stresses above the values listed below may cause permanent device failure. Exposure to absolute maximum ratings for extended periods may affect device reliability.

Table 2 Absolute Maximum Ratings

VDDmr	Supply Voltage	-0.5	3.9	V
Tmr	Temperature	-55	+115	° C
Tjunc	Junction Temperature	-55	+125	° C
Tstor	Storage Temperature	-55	150	° C

2.3. Operating Range

Operating ranges define the limits for functional operation and the parametric characteristics of the device as described in this section. Functionality outside these limits is not implied.

Table 3 Operating Range

3. Circuit Description

The SX1242 comprises a low-consumption fractional-N Sigma-Delta type PLL and power amplifier.

A simplified block diagram of the internal architecture and application schematic is illustrated below in Figure 3

Figure 3. SX1242 Simplified Block Diagram and Application Schematic

3.1. PLL

The VCO operates at twice the RF channel frequency and is derived from a 26 MHz crystal oscillator reference

3.2. Transmitter

The Power Amplifier (PA) is connected to the RFOUT pin and delivers 12 dBm in a 50 ohm load. The bit stream to be transmitted over the air is sent to the chip via the pin DATA. During modulation, the rising and falling transitions are smoothed with a ramp-up/ramp-down time of typically 20 μ s via the PA reference DAC.

3.3. SX1242 Operating Modes

The SX1242 operating modes are defined by the status of the pin TX ENABLE and are documented in Table 5.

Table 5 SX1242 Operating Modes

TX Enable Status	Mode	Enabled Blocks
0 (GND)	Sleep	All blocks are off
1 (VDD)	Transmit	The blocks are switched on according to a predefined sequence and the data is transmitted once the sequence is completed

The behavior of the SX1242 is illustrated in the timing diagram below:
