

## Asynchronous Boost Controller

### General Description

The SX1302 is a boost topology switching regulator control IC for battery-powered applications. The SX1302 includes a totem-pole single output stage for driving NPN transistor or N-MOS, high precision reference voltage(0.5V) to compare output voltage with feedback amplifier, an internal duty time control for controlling the minimum duty cycle, programmable soft start with short circuit protection function and logic level control for operating mode or standby mode.

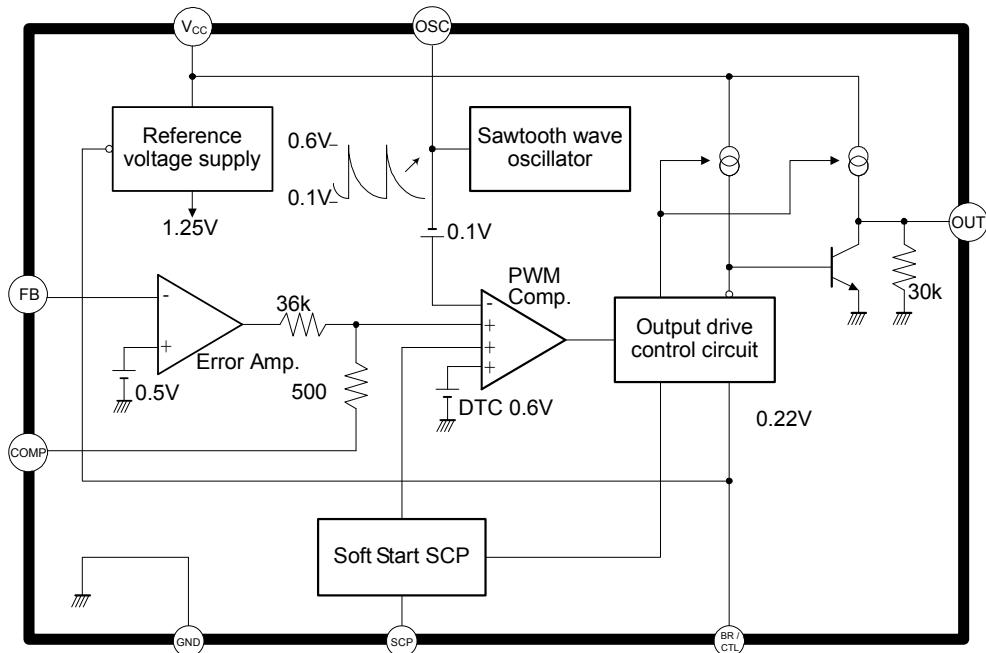

### Features

- Wide Supply Voltage Operating Range: 1.8 to 15V
- Precision Reference Voltage: 0.5V ±2%
- Low Current Consumption: 5.5mA in Operation Mode
- Low Current Consumption: 1µA in Standby Mode
- High Oscillator Frequency: 1MHz max.
- Totem-Pole Output with Adjustable ON / OFF Current (for NPN Transistors or n-Channel MOSFET)
- Logic Level Control Stand-by Mode Function
- Programmable Soft Start Function (SS)
- Short Circuit Protection Function (SCP)
- Package: TSSOP-8L

### Applications

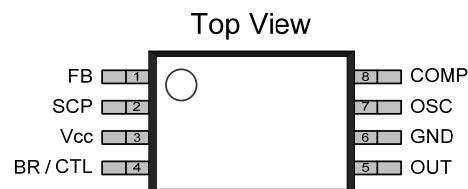

- Digital Camera
- PDA
- Portable Equipment

## Function Block Diagram

## Pin Descriptions

**TSSOP-8L**

Name	No.	I / O	Description
FB	1	I	Error Amplifier Inverting Input
SCP	2	I	Soft Start and SCP Function Connect a Capacitor to this pin
V <sub>CC</sub>	3	P	IC power supply
BR / CTL	4	I	Output Current Setting and Control
OUT	5	O	Totem-Pole Output
GND	6	P	IC Ground
OSC	7	I	Oscillator Output: Connect Capacitor and Resistor to this pin for Frequency Adjustment
COMP	8	O	Error Amplifier Compensation Output

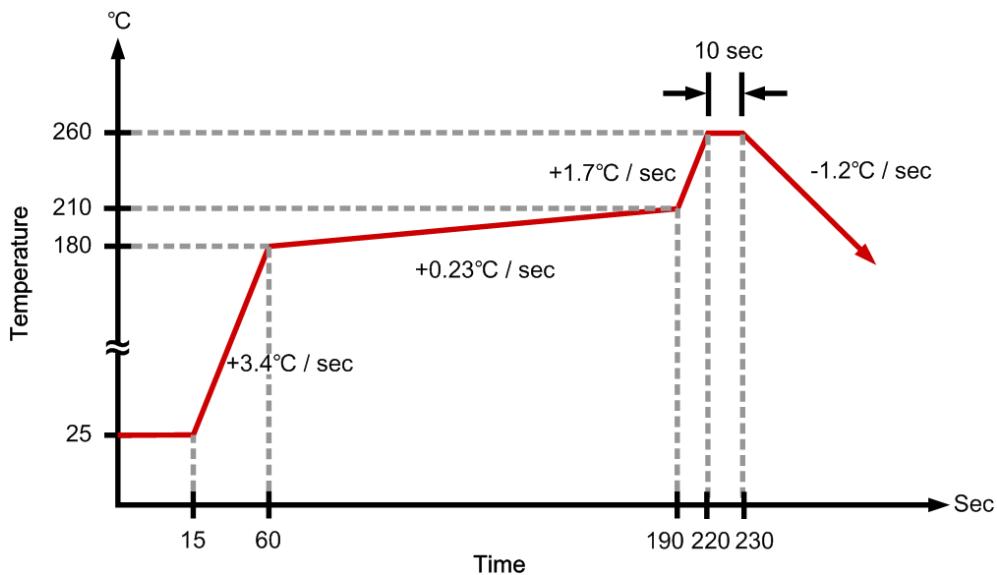

## Ordering Information

Part Number	Operating Temperature	Package	MOQ	Description
SX1302BWR-LF	-10°C ~ +85°C	TSSOP-8L	2500EA	Tape & Reel

## Absolute Maximum Ratings

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Power Supply Voltage	$V_{IN}$				15	V
Output Source Current					-50	mA
Output Sink Current					50	mA
Allowable Power Dissipation		SOP-8L, $T_A \leq +25^\circ C$			570	mW
		MSOP-8L, $T_A \leq +25^\circ C$			400	mW
		TTSOP-8L, $T_A \leq +25^\circ C$			400	mW
Storage Temperature			-55		+125	°C
Lead Temperature		SOP-8L, (soldering, 10 sec)			+260	°C
		TSSOP-8L, (soldering, 10 sec)			+260	°C
		MSOP-8L, (soldering, 10 sec)			+260	°C

## Function Description

### Voltage Reference

A 1.25V regulator operating from  $V_{CC}$  is used to power the SX1302 internal circuitry. An internal resistive divider provides 0.5V reference for the error amplifier, Soft-start (0.9V typ.) and SCP (0.8V typ.) circuits.

### Error Amplifier

The error amplifier compares a sample of the DC-DC converter output voltage to the 0.5V reference and generates an error signal for the PWM comparator. Output voltage of DC-DC converter is setting with the resistor divider using the following equation (see figure12):

$$V_{OUT} = \left(1 + \frac{R1}{R2}\right) \times 0.5$$

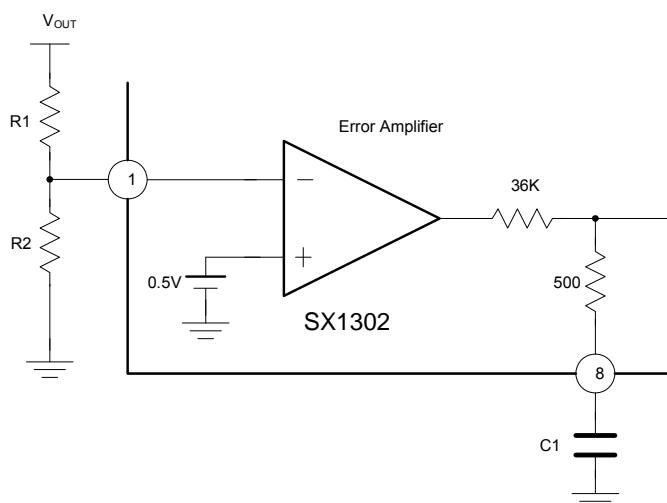

Figure 12 Error Amplifier with Feedback resistance divider

### Oscillator

The oscillator frequency can be set from 20KHz to 1MHz by connecting a resistor and a capacitor at OSC pin of SX1302 to ground. The oscillator frequency can be determined by using the graph shown in Figure 9.

The oscillator output is a sawtooth wave with a minimum value of approximately 0.1V and a maximum value of approximately 0.6V. The PWM comparator compares the oscillator voltage with error amplifier output voltage, internal maximum duty control voltage (0.6V typ.) and soft start setting voltage. When the sawtooth wave voltage is lower than all of above three-output voltage, the output of SX1302 is high (Turn on external NPN transistor or NMOS).

### Under Voltage Lockout (UVLO)

The under voltage lockout circuits turn the output off whenever the supply voltage drops too low (approximately 0.9V at 25°C) for proper operation. A hysteresis voltage of 200mV eliminates false triggering on noise and chattering.

### Soft Start/ Short-circuit protection (SS / SCP)

The soft start is functional after power on. The interval of soft start time is determined by a capacitor connected to SCP pin (pin 2). When soft start function finished, the internal soft start voltage is setting high, but external SCP pin is setting low in order to change to short circuit detection / protection function.

The time of soft start is:

$$T_{ss}[\text{mS}] = 0.35 \times C[\mu\text{F}]$$

The short circuit protection is triggered when a heavy loading makes output voltage drop and error amplifier output (COMP pin) is larger than  $V_{POS}$  (0.9V typ.). The SS pin capacitor will be charged to the SCP threshold voltage (0.8V typ.), then SX1302 output is disabled (internal pull-low) and the capacitor is discharged to low.

The time of short circuit protection is:

$$T_{scp}[\text{mS}] = 0.8 \times C[\mu\text{F}]$$

### Output Transistor

The SX1302 has a totem-pole transistor with a 40mA source/sink current capability to drive an external NPN transistor or NMOS directly. The driving current capability depends on a resistor R that is connected to BR / CTL pin (Pin4) of SX1302. (see figure 13)

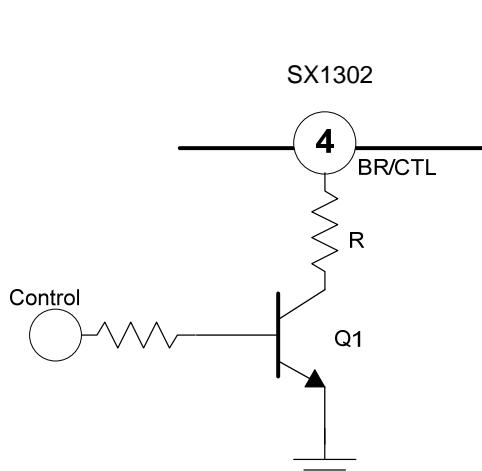

Figure 13 Output Transistor Driving Control Circuit

BR / CTL pin can also use to control the output of SX1302 for disable or enable function of system.

Control Pin	Q1	BR / CTL Pin	Output Transistor Function	Mode
Low	Off	Open	Disable	Stand-by
High	On	Bias Current	Enable	Operation
