

### General Description

The SY67221 is a four half-bridge driver solution for DC brush motors, bipolar stepper motors, solenoids, or other inductive loads. The highly integrated half-H-bridge driver block consists of half-H-bridge with internal logic control, gate driver, over current protection and charge pump circuit. I<sup>2</sup>C communication is also supported.

The SY67221 provides complete protection functions with a fault output pin for open circuit detection (OCD), over current protection (OCP), short circuit protection (SCP), under voltage lockout (UVLO) and thermal shutdown (TSD). A low-power sleep mode is also provided. The device is packaged in a 16-pin TSSOP.

### Ordering Information

Ordering Number	Package type	Note
SY67221HKP	TSSOP-16	

### Features

- Power Supply Voltage Range from 2.7V to 18V
- Different Operation Mode
  - Two H-bridge Operation with Four INx Input
  - Two H-bridge Operation with Two INx Input
  - One H-bridge Operation with Two INx Input, Parallel Operation
  - Four Half-H-bridge Operation with Four INx Input
- Maximum Drive Current of 1.5A RMS Current for Each H-bridge@T<sub>A</sub>=25°C
- Internal Integrated Open Circuit Detection, Over Current Protection, Short Circuit Protection, Under Voltage Lockout and Thermal Shutdown
- Low-power Sleep Mode
- Fault Indication
- TSSOP16 Package

### Applications

- Refrigerators
- DC Brush Motors
- Solenoid Valve Load

### Typical Application

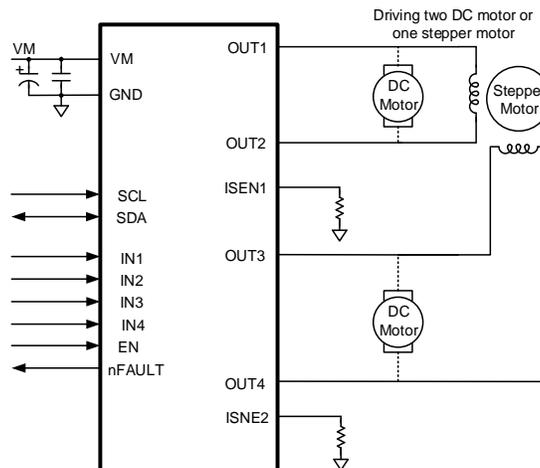

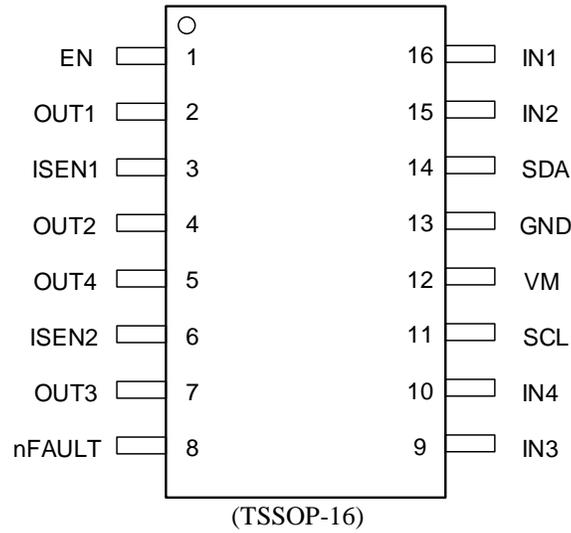

Figure1. Typical Application Circuit

## Pin out (Top View)

**Top Mark: ENExyz** (device code: **ENE**, *x=year code*, *y=week code*, *z=lot number code*)

Pin Name	Pin No.	Description
EN	1	Internal logic enable pin. Set this pin to logic high to enable the device. Logic low puts device in low-power sleep mode, this pin has an internal pulldown resistor.
OUT1	2	Half bridge 1 output pin. Connect this pin to motor winding.
ISEN1	3	Half bridge 1 and Half bridge 2 current sense pin. Connect a resistor between this pin and GND for current control, or connect to GND if current control is not needed.
OUT2	4	Half bridge 2 output pin. Connect this pin to motor winding.
OUT4	5	Half bridge 4 output pin. Connect this pin to motor winding.
ISEN2	6	Half bridge 3 and Half bridge 4 current sense pin. Connect a resistor between this pin and GND for current control, or connect to GND if current control is not needed
OUT3	7	Half bridge 3 output pin. Connect this pin to motor winding.
nFAULT	8	Fault state output pin. Logic low if fault is detected.
IN3	9	Half bridge 3 input pin. Control the state of bridge 3, this pin has an internal pull-down resistor.
IN4	10	Half bridge 4 input pin. Control the state of bridge 4, this pin has an internal pull-down resistor
SCL	11	I <sup>2</sup> C clock input pin.
VM	12	Motor power supply pin. Decouple this pin to GND pin with a 0.1μF ceramic capacitor and a sufficient electrolytic capacitor.
GND	13	Device ground pin.
SDA	14	I <sup>2</sup> C data signal pin.
IN2	15	Half bridge 2 input pin. Control the state of bridge 2, this pin has an internal pull-down resistor.
IN1	16	Half bridge 1 input pin. Control the state of bridge 1, this pin has an internal pull-down resistor.

Note 1: Stresses listed as the above “Absolute Maximum Ratings” may cause permanent damage to the device. These are for stress ratings. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may remain possibility to affect device reliability.

Note 2:  $\theta_{JA}$ ,  $\theta_{JCTOP}$  is measured in the natural convection at  $T_A = 25^\circ\text{C}$  on Silergy EVB.

Note 3: Power dissipation and thermal limits must be observed.

Note 4: Guaranteed by design and sample tested at bench.

## Functional Description

### PWM Motor Drivers

SY67221 contains two identical H-bridge motor drivers with current-control PWM circuitry. A block diagram of the circuitry is shown below:

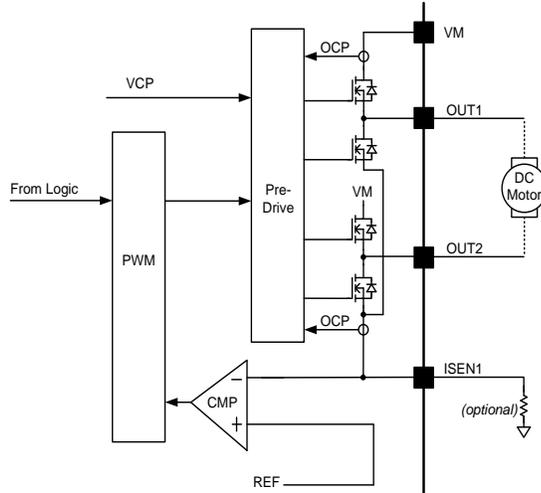

Figure 5. Motor Control Circuitry

Figure 6 shows the current paths in different drive and decay modes.

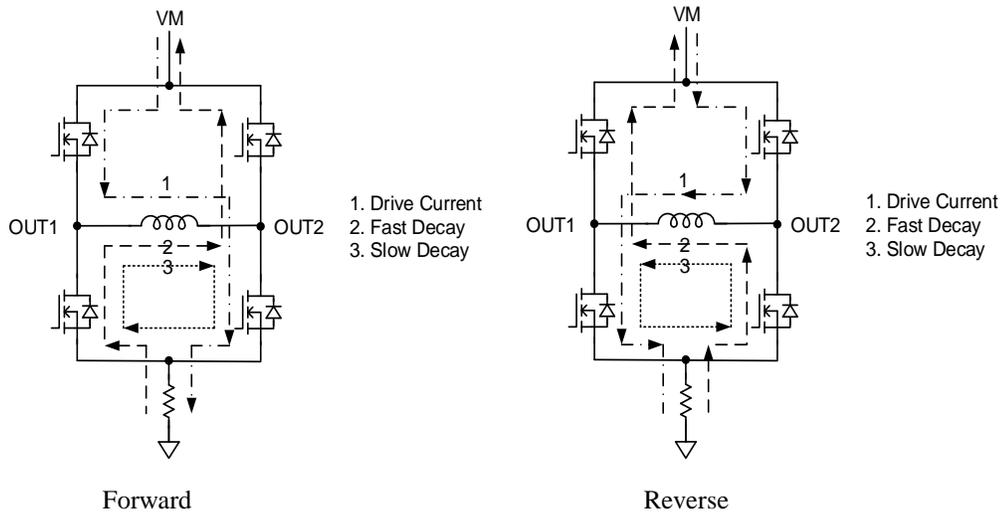

Figure 6. Decay Mode

### Power MOSFETs Driving Control

The Bridge is controlled by I<sup>2</sup>C or by INx input interface. The following table shows the operation mode control logic of the device:

Table 1 Mode Control Logic

PIN control	I <sup>2</sup> C control	Four Half-H bridge work mode
HWMODE=4'b0000	MODE REGISTER	
SDA=L, SCL=L	11b	Half-H-bridge, Mode3
SDA=L, SCL=H	10b	One H-bridge, Mode2
SDA=H, SCL=L	01b	Two H-bridge, Mode1

SDA=H, SCL=H	00b	Two H-bridge, Mode0
--------------	-----	---------------------

### MODE 0 (Two H-bridge, four INx control input)

In this mode, SY67221 is configured to driver a stepper motor or two brushed DC motor.

Table 2 Mode 0 Truth table

EN	IN1	IN2	IN3	IN4	OUT1	OUT2	OUT3	OUT4	Function
0	X	X	X	X	Z	Z	Z	Z	Sleep mode
1	0	0			Z	Z			Coast
1	0	1			L	H			Reverse
1	1	0			H	L			Forward
1	1	1			L	L			Brake
1			0	0			Z	Z	Coast
1			0	1			L	H	Reverse
1			1	0			H	L	Forward
1			1	1			L	L	Brake

### MODE 1 (Two H-bridge, IN1, IN2 control input)

In this mode, SY67221 is configured to driver a stepper motor or two brushed DC motor with lower number of control inputs to save the I/O of MCU.

Table 3 Mode 1 Truth table

EN	IN1	IN2	IN3	IN4	OUT1	OUT2	OUT3	OUT4	Function
0	X	X	X	X	Z	Z	Z	Z	Sleep mode
1	0		X	X	L	H			Reverse
1	1		X	X	H	L			Forward
1		0	X	X			L	H	Reverse
1		1	X	X			H	L	Forward

### MODE 2 (One H-bridge, IN1, IN2 control input)

In this mode, SY67221 is configured to driver a brushed DC motor with larger current.

Table 4 Mode 2 Truth table

EN	IN1	IN2	IN3	IN4	OUT1	OUT2	OUT3	OUT4	Function
0	X	X	X	X	Z	Z	Z	Z	Sleep mode
1	0	0	X	X	Z	Z	Z	Z	Coast
1	0	1	X	X	L	H	L	H	Reverse
1	1	0	X	X	H	L	H	L	Forward
1	1	1	X	X	L	L	L	L	Brake

### MODE 3 (Four Half-H-bridge, four INx control input)

In this mode, SY67221 is configured to driver four independent loads such as relays and other inductive loads.

Table 5 Mode 3 Truth table

EN	IN1	IN2	IN3	IN4	OUT1	OUT2	OUT3	OUT4	Function
0	X	X	X	X	Z	Z	Z	Z	Sleep mode
1	0				L				OUT1=L

1			1				H		OUT3=H
1				0				L	OUT4=L

1				1				H	OUT4=H
---	--	--	--	---	--	--	--	---	--------

### Current Control

The current through the motor windings may be limited, or controlled, by a fixed-frequency PWM current regulation, or current chopping. For DC motors, current control is used for limiting the start-up and stalling current of the motor. For stepper motors, current control is used frequently at all times.

When an H-bridge is enabled, current rises through the winding at a rate dependent on the DC voltage and inductance of the winding. If the current reaches the current chopping threshold, the bridge will disable the current until the beginning of the next PWM cycle. Note that immediately after the current is enabled, the voltage on the ISENx pin is ignored for a fixed period of time before enabling the current sense circuitry. This blanking time is fixed at about 2μs. This blanking time also sets the minimum on time of the PWM when operating in current chopping mode.

The PWM chopping current is set by a comparator which compares the voltage across a current sense resistor connected to the ISENx pins with a reference voltage.

The chopping current is calculated in Equation 1.

$$I_{CHOP} = \frac{Gain \times V_{TRIP}}{R_{SENSE}} \quad (1)$$

Example:

**CONT 2** bit[4] DECAy=1b, once the chopping current threshold is reached, the H-bridge will switch to slow decay mode. Winding current is re-circulated by enabling both of the low-side FETs in the bridge. This state is held until the beginning of the next fixed-frequency PWM cycle.

Note that if current control is not needed, the ISENx pins should be connected directly to ground.

### Current Recirculation and Decay Modes

During PWM current trip operation, the H-bridge is enabled to drive current through the motor winding until the trip threshold of the current regulation is reached. After the trip current threshold is reached, the drive current is interrupted, but, because of the inductive nature of the motor, current must continue to flow for some time. This continuous flow of current is called recirculation current. A mixed decay allows a better current regulation by optimizing the current ripple by using fast and slow decay.

Mixed decay is a combination of fast and slow decay modes. Mixed decay starts with fast decay, then goes to slow decay. In the SY67221 device, the mixed decay ratio is 25% fast decay and 75% slow decay as shown in Figure 7.

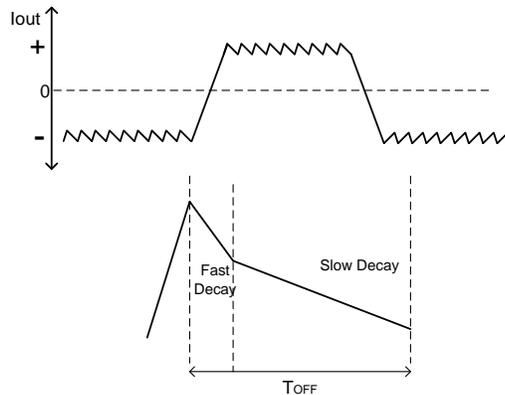

Figure 7. Current Regulation and Decay timing

### Sleep Mode

Driving EN pin low will put the device into a low power sleep state. In this state, the H-bridges are disabled, all internal logic is reset, and all internal clocks are stopped. All inputs are ignored until the EN pin is pulled logic high. When returning from sleep mode, some time needs to pass before the motor driver becomes fully operational.

## Multi-Slave Operation

Figure 8 shows the schematic diagram of SY67221 Multi-slave operation. Multi-slave operation can use a microcontroller to control multiple devices at the same time. The steps to configure the multi-slave of SY67221 are as follows:

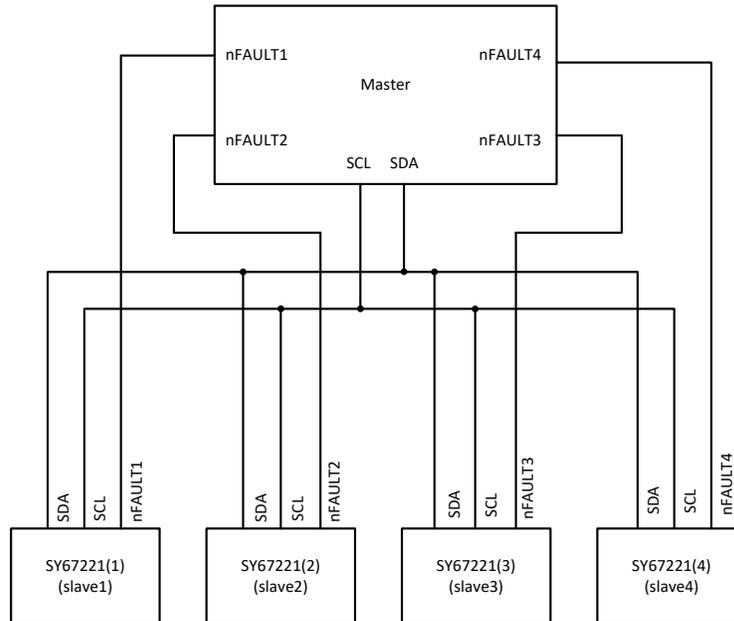

Figure 8. Multi-Slave Operation of SY67221

- Scan the addresses of all cascaded slavers, configure *CONT2*(0x02) to 0x40, disable nFAULT;
- Select a slaver, and then pull down the nFAULT PIN of the remaining slaver, 0x00 (address of 0x60) write an arbitrary number as the new address of the selected slaver (for example, write 0x61 for 0x00), Pull down the slaver's nFAULT
- Then select a slaver to cancel its external pull-down state, and write an arbitrary number with 0x00 as the new address (for example, 0x00 write 0x62, pay attention to be different from the previous 0x61), Pull down the slaver's nFAULT. other slavers can be deduced by analogy;
- Configure *CONT2*(0x02) to 0x00, restore the DISFLT bit to the default state, and then cancel the external pull-down of all slaver's nFAULT;
- Now all connected slave devices can be accessed using the newly reprogrammed address;
- The above steps should be repeated for any device in case of a power reset (EN).

## Protection Circuits

The device is fully protected against under voltage lockout, over current protection, open circuit detection and thermal shutdown.

### Under Voltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage lockout threshold voltage, all circuitry in the device will be disabled, and all internal logic will be reset. Operation will resume when VM rises above the UVLO threshold. nFAULT is driven low in the event of an undervoltage condition.

### Over Current Protection (OCP)

An analog current limit circuit on each FET limits the current through the FET. If this analog current limit persists for longer than the OCP regulation time, all FETs in the H-bridge will be disabled and the nFAULT pin will be driven low. The driver will be re-enabled after the OCP retry period (*t*<sub>OCP</sub>) has passed; nFAULT becomes high again at this time. If the fault condition is still present, the cycle repeats. If the fault is no longer present, normal operation resumes. Please note that only the H-bridge in which the OCP is detected will be disabled while the other bridge will function normally. The SY67221 has a programmable option for auto-retry or the latch mode. If *CONT2* bit[3] OCP=0b, OCP is in retry mode. If *CONT2* bit[3] OCP=1b, OCP is in latch mode. Overcurrent conditions

are detected independently on both high and low side devices; i.e., a short to ground, supply, or across the motor winding will all result in an overcurrent shutdown.

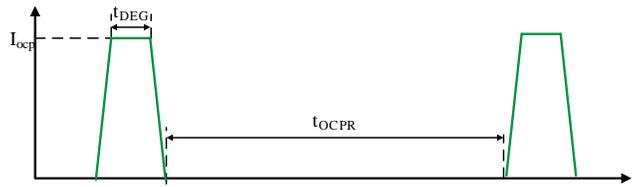

Figure 9. SY67221 OCP Waveform

### **Open Circuit Detection (OCD)**

Both high-side and low-side switches of the half-bridge power outputs are capable of detecting an open circuit. OCD runs at power up or when the device comes out from sleep mode, and also can run at any time by using OCDOD bit. The OCD implementation is done on the full-bridge and the half-bridge. In the SY67221 device, during an open circuit condition, the half-bridges, full-bridges, or both bridges (depending on the MODE bit) are always operating and the nFAULT pin is pulled low, the user must reset the power to release the nFAULT pin by doing the OCD sequence again. In the SY67221 device, the user can program the full-bridge or half-bridge to be in the operating mode or the Hi-Z state, whenever an open circuit condition is detected by using the OCDBO bit. Moreover, the nFAULT signaling on the OCD bit can be disabled using the OCDOD bit.

### **Thermal Shut down (TSD)**

If the die temperature exceeds safe limits, all MOSFETs in the both H-bridge are disabled. Once the die temperature has fallen to a safe level, operation automatically resumes.

### **I<sup>2</sup>C Compatible Interface**

The SY67221 features an I<sup>2</sup>C interface that allows the HOST processor to program or to control the motor. The I<sup>2</sup>C interface supports clock speeds of up to 400 kHz and uses standard I<sup>2</sup>C commands. The SY67221 always operates as a slave device, and is addressed using a 7-bit slave address followed by an 8<sup>th</sup> bit, which indicates whether the transaction is a read-operation or a write-operation.

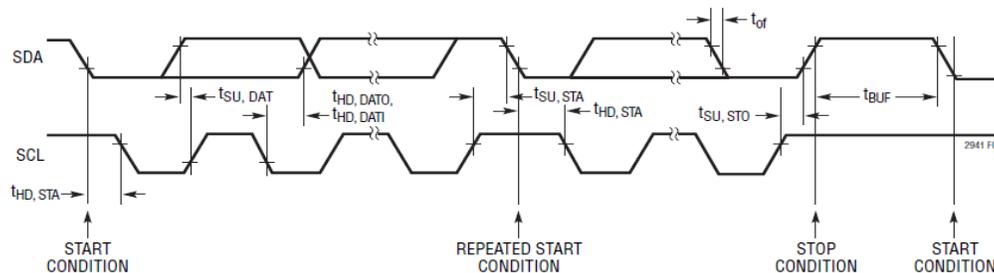

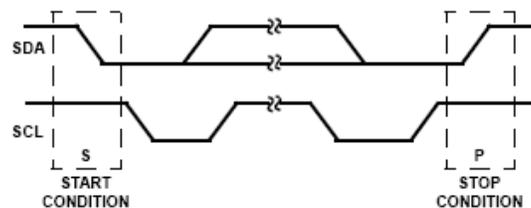

Figure 10. I<sup>2</sup>C Timing Diagram

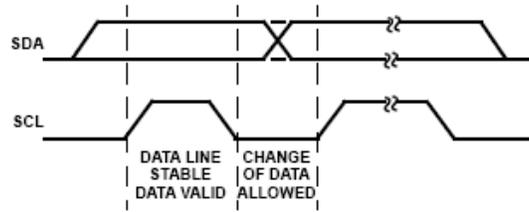

### **START and STOP Conditions**

The SY67221 is controlled via an I<sup>2</sup>C compatible interface. The START condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The STOP condition is a LOW to HIGH transition on the SDA line while SCL is HIGH. A STOP condition must be sent before each START condition. The I<sup>2</sup>C master always generates the START and STOP conditions.

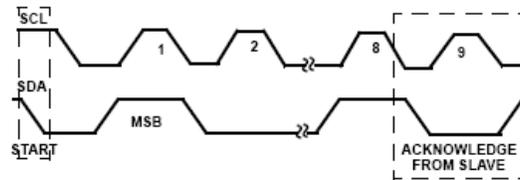

## Data Validity

The data on the SDA line must be stable during the HIGH period of the SCL, unless generating a START or STOP condition. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW.

## Acknowledge:

Each address and data transmission uses 9-clock pulses. The ninth pulse is the acknowledge bit (ACK). After the START condition, the master sends 7-slave address bits and an R/W bit during the next 8-clock pulses. During the ninth clock pulse, the device that recognizes its own address holds the data line low to acknowledge. The acknowledge bit is also used by both the master and the slave to acknowledge receipt of register addresses and data.

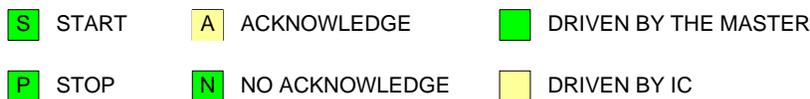

## Data Transactions:

All transactions start with a control byte sent from the I<sup>2</sup>C master device. The control byte begins with a START condition, followed by 7-bits of slave address 0x60 followed by the 8<sup>th</sup> bit, R/W bit. The R/W bit is 0 for a write or 1 for a read. If any slave devices on the I<sup>2</sup>C bus recognize their address, they will acknowledge by pulling the SDA line low for the last clock cycle in the control byte. If no slaves exist at that address or are not ready to communicate, the data line will be 1, indicating a Not Acknowledge condition. Once the control byte is sent, and the SY67221 acknowledges it, the 2nd byte sent by the master must be a register address byte. The register address byte tells the IC which register the master will write or read. Once the SY67221 receives a register address byte it responds with an acknowledge signal.

**Side view A**

**Side view B**

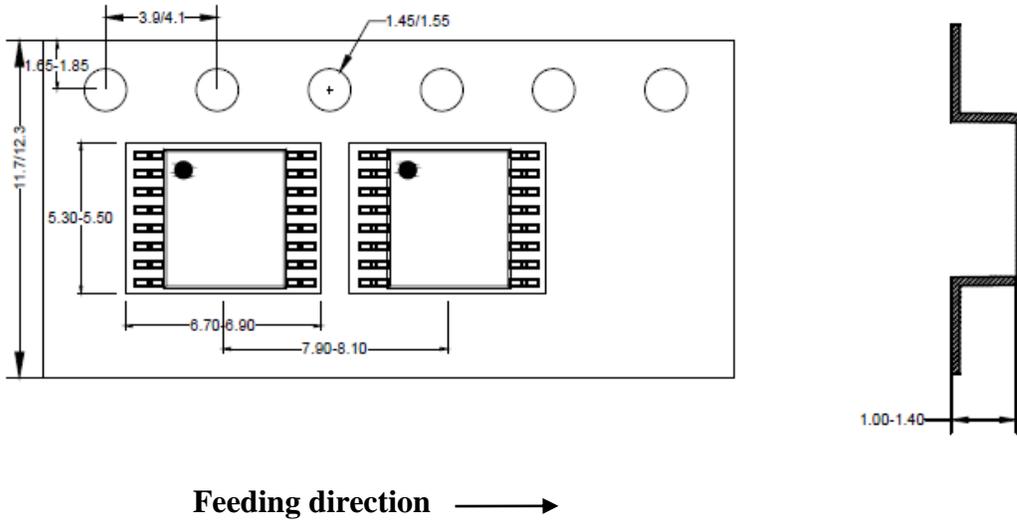

**Recommended PCB Layout**

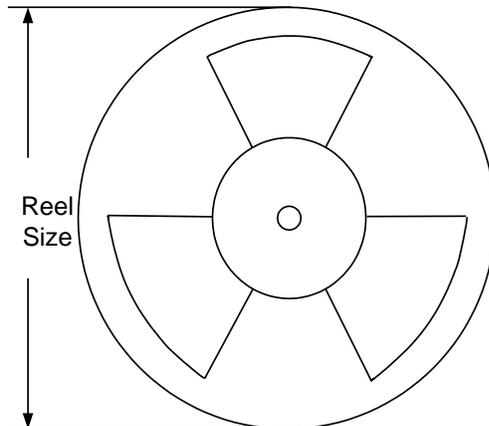

**Notes: All dimension in millimeter and exclude mold flash & metal burr.**

## Taping & Reel Specification

### 1. TSSOP16 Taping orientation

### 2. Carrier Tape & Reel specification for packages

Package types	Tape width (mm)	Pocket pitch(mm)	Reel size (Inch)	Trailer * length(mm)	Leader * length (mm)	Qty per reel (pcs)
TSSOP16	12	8	13"	400	400	3000

### 3. Others: NA

## Revision History

The revision history provided is for informational purpose only and is believed to be accurate, however, not warranted. Please make sure that you have the latest revision.

<b>Date</b>	<b>Revision</b>	<b>Change</b>
Dec 07, 2024	Revision 1.0	Production Release
Dec 07, 2023	Revision 0.9C	1. page 6 Modify the marked areas in red circles according to the notes 2. page 7 Modify the marked areas in red circles according to the notes 3. 0x00 SL_ADD register type from R change to R/W
Oct 24, 2023	Revision 0.9B	Add ESD information
Aug. 25, 2022	Revision 0.9A	Update power supply recommended capacitor from “Decouple this pin to GND pin with a 10 $\mu$ F ceramic capacitor and a sufficient electrolytic capacitor.” to "Decouple this pin to GND pin with a 0.1 $\mu$ F ceramic capacitor and a sufficient electrolytic capacitor."
Apr.1, 2021	Revision 0.9	Initial Release

---

## IMPORTANT NOTICE

- 1. Right to make changes.** Silergy and its subsidiaries (hereafter Silergy) reserve the right to change any information published in this document, including but not limited to circuitry, specification and/or product design, manufacturing or descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products are sold subject to Silergy's standard terms and conditions of sale.
- 2. Applications.** Application examples that are described herein for any of these products are for illustrative purposes only. Silergy makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification. Buyers are responsible for the design and operation of their applications and products using Silergy products. Silergy or its subsidiaries assume no liability for any application assistance or designs of customer products. It is customer's sole responsibility to determine whether the Silergy product is suitable and fit for the customer's applications and products planned. To minimize the risks associated with customer's products and applications, customer should provide adequate design and operating safeguards. Customer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Silergy assumes no liability related to any default, damage, costs or problem in the customer's applications or products, or the application or use by customer's third-party buyers. Customer will fully indemnify Silergy, its subsidiaries, and their representatives against any damages arising out of the use of any Silergy components in safety-critical applications. It is also buyers' sole responsibility to warrant and guarantee that any intellectual property rights of a third party are not infringed upon when integrating Silergy products into any application. Silergy assumes no responsibility for any said applications or for any use of any circuitry other than circuitry entirely embodied in a Silergy product.
- 3. Limited warranty and liability.** Information furnished by Silergy in this document is believed to be accurate and reliable. However, Silergy makes no representation or warranty, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. In no event shall Silergy be liable for any indirect, incidental, punitive, special or consequential damages, including but not limited to lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges, whether or not such damages are based on tort or negligence, warranty, breach of contract or any other legal theory. Notwithstanding any damages that customer might incur for any reason whatsoever, Silergy's aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Standard Terms and Conditions of Sale of Silergy.
- 4. Suitability for use.** Customer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of Silergy components in its applications, notwithstanding any applications-related information or support that may be provided by Silergy. Silergy products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of a Silergy product can reasonably be expected to result in personal injury, death or severe property or environmental damage. Silergy assumes no liability for inclusion and/or use of Silergy products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.
- 5. Terms and conditions of commercial sale.** Silergy products are sold subject to the standard terms and conditions of commercial sale, as published at <http://www.silergy.com/stdterms>, unless otherwise agreed in a valid written individual agreement specifically agreed to in writing by an authorized officer of Silergy. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. Silergy hereby expressly objects to and denies the application of any customer's general terms and conditions with regard to the purchase of Silergy products by the customer.
- 6. No offer to sell or license.** Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights. Silergy makes no representation or warranty that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right. Information published by Silergy regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from Silergy under the patents or other intellectual property of Silergy.
