1. General Description

This specification applies to the 65.0 inch Color TFT-LCD Module T650HVD02.0. This LCD module has a TFT active matrix type liquid crystal panel 1,920x1,080 pixels, and diagonal size of 65.0 inch. This module supports 1,920x1,080 mode. Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 10-bit gray scale signal for each dot.

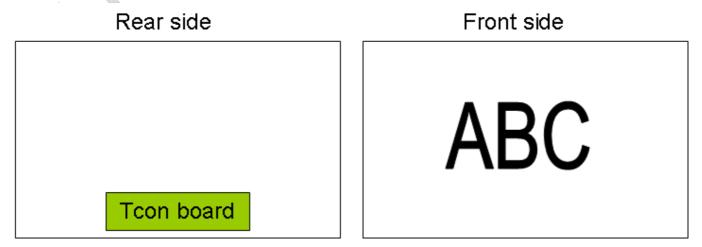

The T650HVD02.0 has been designed to apply the 10-bit 4 channel LVDS interface method. It is intended to support displays where high brightness, wide viewing angle, high color saturation, and high color depth are very important. Also, 3D function is also embedded into front glass as pattern retarder.

* General Information

Items	Specification	Unit	Note
Active Screen Size	65	inch	
Display Area	1428.48 (H) x 803.52 (V)	mm	
Outline Dimension	1454.3(H) x 831.5(V) x 31.6(D)	mm	D: front bezel to T-con cover
Driver Element	a-Si TFT active matrix		
Bezel Opening	1434.5 (H) x 809.6 (V)	mm	
Display Colors	10 bit, 1.07B	Colors	
Number of Pixels	1,920x1,080	Pixel	
Pixel Pitch	0.744	mm	
Pixel Arrangement	RGB vertical stripe		
Display Operation Mode	Normally Black		
Rotate Function	Unachievable		Note 1
Display Orientation	Signal input with "ABC"		Note 2

Note 1: Rotate Function refers to LCD display could be able to rotate.

Note 2: LCD display as below illustrated when signal input with "ABC".

2. Absolute Maximum Ratings

The followings are maximum values which, if exceeded, may cause faulty operation or damage to the unit

Note 1: Duration:50 msec.

Note 2 : Maximum Wet-Bulb should be 39 $^{\circ}$ C and No condensation.

The relative humidity must not exceed 90% non-condensing at temperatures of 40° C or less. At temperatures greater than 40° C, the wet bulb temperature must not exceed 39° C.

Note 3: Surface temperature is measured at 50 ℃ Dry condition

3. Electrical Specification

The T650HVD02.0 requires two power inputs. One is employed to power the LCD electronics and to drive the TFT array and liquid crystal. The other is to power Back Light Unit.

3.3 Signal Timing Specification

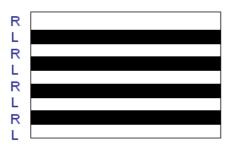

This is the signal timing required at the input of the user connector. All of the interface signal timing should be satisfied with the following specifications for its proper operation.

Timing Table (DE only Mode)

Signal	Item	Symbol	Min.	Тур.	Max	Unit
Vertical Section	Period	Tv	1100	1130	1392	Th
	Active	Tdisp (v)		1080		Th
	Blanking	Tblk (v)	20	50	312	Th
	Period	Th	520	570	580	Tclk
Horizontal Section	Active	Tdisp (h)		480		Tclk
	Blanking	Tblk (h)	40	90	100	Tclk
Clock	Frequency	Fclk=1/Tclk	64.8	77.29	80.74	MHz
Vertical Frequency	Frequency	Fv	94	120	122	Hz
Horizontal Frequency	Frequency	Fh	120	135.6	139.2	KHz

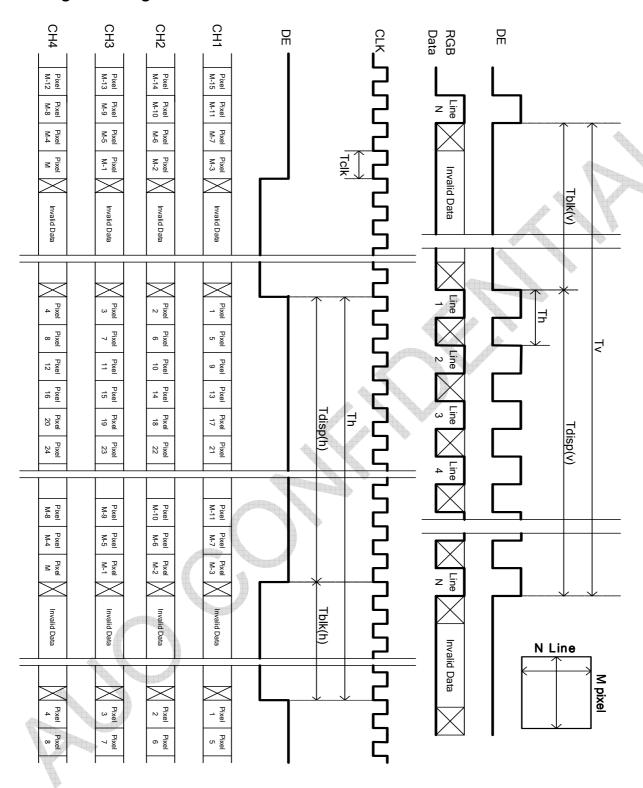

Notes:

- (1) Display position is specific by the rise of DE signal only.
 Horizontal display position is specified by the rising edge of 1st DCLK after the rise of 1st DE, is displayed on the left edge of the screen.
- (2) Vertical display position is specified by the rise of DE after a "Low" level period equivalent to eight times of horizontal period. The 1st data corresponding to one horizontal line after the rise of 1st DE is displayed at the top line of screen.
- (3)If a period of DE "High" is less than 1920 DCLK or less than 1080 lines, the rest of the screen displays black.
- (4)The display position does not fit to the screen if a period of DE "High" and the effective data period do not synchronize with each other.
- (5) Under 3D mode, signal should be input as following sequence: 1st line: right eye, 2nd line: left eye (when rotate function is not implemented and T-con position is at panel upper side).

3.4 Signal Timing Waveforms

3.5 Color Input Data Reference

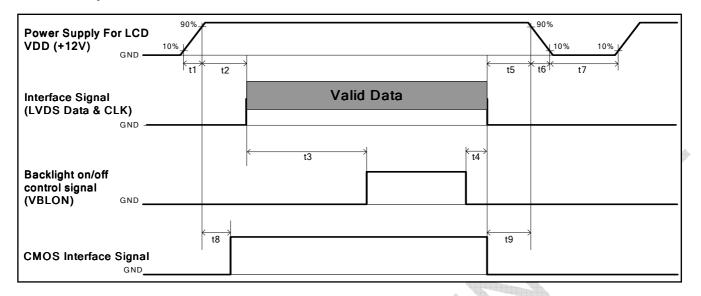

The brightness of each primary color (red, green and blue) is based on the 10 bit gray scale data input for the color; the higher the binary input, the brighter the color. The table below provides a reference for color versus data input.

Note:

- (1) t4=0 : concern for residual pattern before BLU turn off.
- (2) t6 : voltage of VDD must decay smoothly after power-off. (customer system decide this value)
- (3) When CMOS Interface signal is N.C. (no connection), opened in Transmitted end, t8 timing spec can be negligible.

4. Optical Specification

Optical characteristics are determined after the unit has been 'ON' and stable for approximately 45 minutes in a dark environment at 25 °C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of ϕ and θ equal to 0° .

Fig.1 presents additional information concerning the measurement equipment and method.

Note:

1. Contrast Ratio (CR) is defined mathematically as:

2. Surface luminance is luminance value at point 5 across the LCD surface 50cm from the surface with all pixels displaying white. From more information see FIG 2. When LED current I_F = typical value (without driver board), LED input VDDB =24V, I_{DDB}. = Typical value (with driver board), L_{WH}=Lon5 where Lon5 is the luminance with all pixels displaying white at center 5 location.

FIG. 2 Luminance

3. The variation in surface luminance, δWHITE is defined (center of Screen) as:

 $\delta_{WHITE(9P)}$ = Maximum($L_{on1}, L_{on2}, ..., L_{on9}$)/ Minimum($L_{on1}, L_{on2}, ..., L_{on9}$)

4. Response time T_{γ} is the average time required for display transition by switching the input signal for five luminance ratio (0%,25%,50%,75%,100% brightness matrix) and is based on F_{ν} =120Hz to optimize.

Me	asured		Target								
Response Time		0%	25%	50%	75%	100%					
	0%		0% to 25%	0% to 50%	0% to 75%	0% to 100%

	75%	75% to 0%	75% to 25%	75% to 50%		75% to 100%					
	100%	100% to 0%	100% to 25%	100% to 50%	100% to 75%						

 T_{γ} is determined by 10% to 90% brightness difference of rising or falling period. (As illustrated)

The response time is defined as the following figure and shall be measured by switching the input signal for "any level of grey(bright)" and "any level of gray(dark)".

5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG3.

FIG.3 Viewing Angle

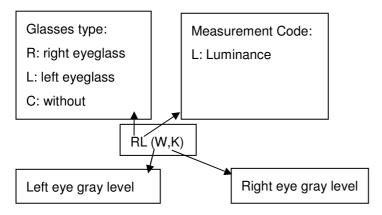

- 6. 3D performance specification is expressed by 3D luminance, 3D Crosstalk and 3D viewing angle. 3D luminance which is defined by summation of left and right eye brightness under wearing glasses condition is measured at panel center point. Also, 3D crosstalk is measured at panel center point.
 - a. Cross talk (middle) is defined by observation position which is 2.4m distance from panel center point and human head in 0 degree steady vertical angle from panel mid axis level.
 - b. Cross talk (in vertical viewing angle) is defined by observation position which is 2.4m distance from panel center point and observation range within specified degrees of vertical angle from panel mid axis level, and the value is limited by 10%.

For more information, refer to 6-5 3D Measurement of 3D view angle.

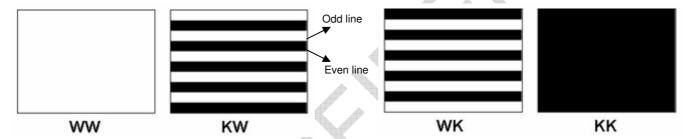

6-1 Notation of measurement.

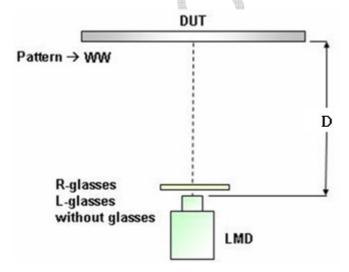

6-2 Measurement Configuration

4-test patterns (first character refers to Left eye gray level; second one refers to Right eye gray level). W is defined as brightness gray level; K is defined as dark state where black and white lines are displayed on even or odd lines.

6-3 Measurement of 3D luminance

- a. Test pattern WW is displayed, measuring distance is 50cm.
- b. Left or right eyeglass are placed in front of SR3 or equivalent equipment (as FIG1 showed) successively and luminance is measured at panel center point where the notation for luminance measurement is RL(W,W) and LL(W,W).

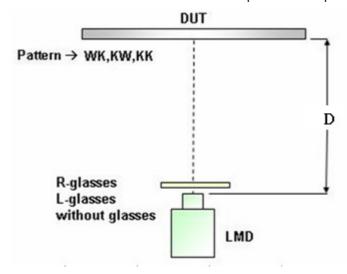

$$3D Lum = \frac{R_L(W,W) + L_L(W,W)}{2}$$

6-4 Measurement of 3D Crosstalk

- a. Test patterns KW, WK and KK are displayed, measuring distance is 2.4m.
- b. Right or left eyeglass is placed in front of SR3 or equivalent equipment (as FIG1 showed) successively

and luminance is measured at panel center point

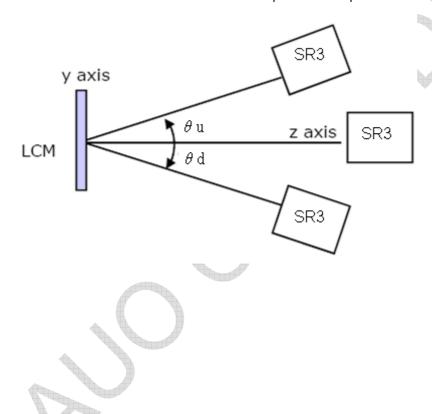

$$Crosstalk_{R} = \frac{R_{L}(W, K) - R_{L}(K, K)}{R_{L}(K, W) - R_{L}(K, K)} \times 100\%$$

$$Crosstalk_{L} = \frac{L_{L}(K, W) - L_{L}(K, K)}{L_{L}(W, K) - L_{L}(K, K)} \times 100\%$$

$$Crosstalk = \frac{Crosstalk_R + Crosstalk_L}{2}$$

6-5 Measurement of 3D view angle

The angles are determined for the vertical or y axis with respect to the z axis which is normal to the LCD module surface and measured at panel center position.

8. Packing

8-1 DEFINITION OF LABEL:

A. Panel Label:

Green mark description

- (1) For Pb Free Product, AUO will add Pb for identification.
- (2) For RoHs compatible products, AUO will add RoHS for identification.

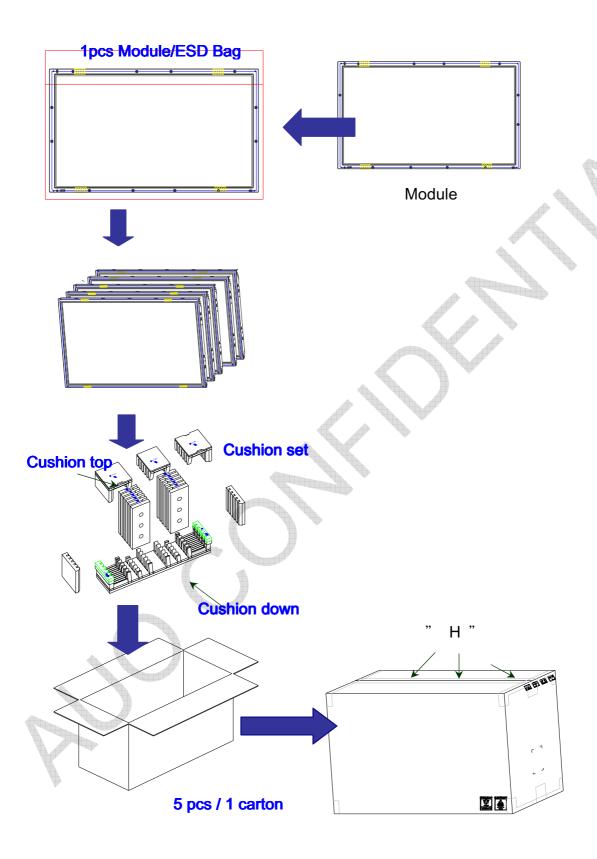

Note: The green Mark will be present only when the green documents have been ready by AUO internal green team. (definition of green design follows the AUO green design checklist.)

9. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD module.

9-1 MOUNTING PRECAUTIONS

- (1) You must mount a module using holes arranged in four corners or four sides.
- (2) You should consider the mounting structure so that uneven force (ex. twisted stress) is not applied to module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
- (3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to the resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter cause circuit broken by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizer with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front/ rear polarizer. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.

9-2 OPERATING PRECAUTIONS

- (1) The device listed in the product specification sheets was designed and manufactured for TV application
- (2) The spike noise causes the mis-operation of circuits. It should be lower than following voltage: V=±200mV(Over and under shoot voltage)
- (3) Response time depends on the temperature. (In lower temperature, it becomes longer..)
- (4) Brightness of CCFL depends on the temperature. (In lower temperature, it becomes lower.) And in lower temperature, response time (required time that brightness is stable after turned on) becomes longer.
- (5) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (6) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (7) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall

be done by system manufacturers. Grounding and shielding methods may be important to minimize the interface.

9-3 ELECTROSTATIC DISCHARGE CONTROL

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wristband etc. And don't touch interface pin directly.

9-4 PRECAUTIONS FOR STRONG LIGHT EXPOSURE

Strong light exposure causes degradation of polarizer and color filter.

9-5 STORAGE

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
- (2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.

9-6 HANDLING PRECAUTIONS FOR PROTECTION FILM

- (1) The protection film is attached to the bezel with a small masking tape. When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
- (2) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the bezel after the protection film is peeled off.
- (3) You can remove the glue easily. When the glue remains on the bezel or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.
