1. GENERAL DESCRIPTION

This specification applies to the 65 inch Color TFT-LCD SKD model T650QVD01.0. This LCD Open Cell Unit has a TFT active matrix type liquid crystal panel 3840x2160 pixels, and diagonal size of 65 inch. This Open Cell Unit supports 3840x2160 mode. Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 10-bit gray scale signal for each dot.

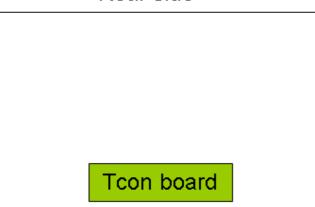

Items	Specification	Unit	Note
Active Screen Size	65	inch	
Display Area	1428.48(H) x 803.52(V)	mm	
Outline Dimension	1444.08(H) x 821.12 (V) x 2.26(D)	mm	D: cell thickness
Driver Element	a-Si TFT active matrix		
Bezel Opening	1434.5 (H) x 809.6 (V)	mm	Recommend
Display Colors	10 bit, 16.7M	Colors	
Number of Pixels	3840x2160	Pixel	
Pixel Pitch	0.372 (H) x 0.372(W)	mm	
Pixel Arrangement	RGB vertical stripe		
Display Operation Mode	Normally Black		
Surface Treatment	Anti-Glare, 3H		Haze=2%
Weight	4.7	kg	
Rotate Function	Achievable or Unachievable		Note 1
Display Orientation	Signal input with "ABC"		Note 2

* General Information

Note 1: Rotate Function refers to LCD display could be able to rotate.

Note 2: LCD display as below illustrated when signal input with "ABC".

Rear side

Front side

2. ABSOLUTE MAXIMUM RATINGS

The followings are maximum values which, if exceeded, may cause faulty operation or damage to the unit

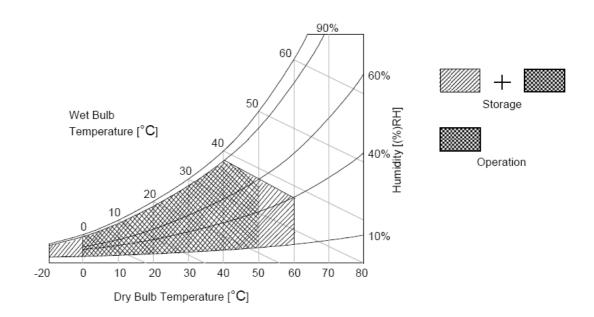

Item	Symbol	Min	Мах	Unit	Conditions
Logic/LCD Drive Voltage	Vcc	-0.3	14	[Volt]	Note 1
Input Voltage of Signal	Vin	-0.3	3.6	[Volt]	Note 1
Operating Temperature	TOP	0	+50	[°C]	Note 2
Operating Humidity	HOP	10	90	[%RH]	Note 2
Storage Temperature	TST	-20	+60	[°C]	Note 2
Storage Humidity	HST	10	90	[%RH]	Note 2
Panel Surface Temperature	PST		65	[°C]	Note 3

Note 1: Duration:50 msec.

Note 2 : Maximum Wet-Bulb should be $39^\circ\!\mathrm{C}$ and No condensation.

The relative humidity must not exceed 90% non-condensing at temperatures of 40° C or less. At temperatures greater than 40° C, the wet bulb temperature must not exceed 39° C.

Note 3: Surface temperature is measured at 50 $^\circ\! \mathbb C$ Dry condition

3. ELECTRICAL SPECIFICATION

The T650QVD01.0 Open Cell Unit requires power input which is employed to power the LCD electronics and to drive the TFT array and liquid crystal.

3.1 ELECTRICAL CHARACTERISTICS

3.1.1 DC CHARACTERISTICS

	Parameter	Symbol		Value		Unit	Note
	Falameter	Symbol	Min.	Тур.	Max	Unit	Note

menace	I2C data hold time	T _{SDH}	0		900	ns	
	SDA and SCL rise time	T _R			1000	ns	
	SDA and SCL fall time	T _F			300	ns	

3.1.3: Driver Characteristics

Item	Symbol	Min	Max	Unit	condition
Driver Surface Temperature	DST		100	[°C]	Note

Note : Any point on the driver surface must be less than 100° under any conditions.

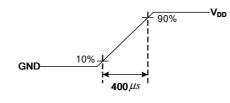

Note :

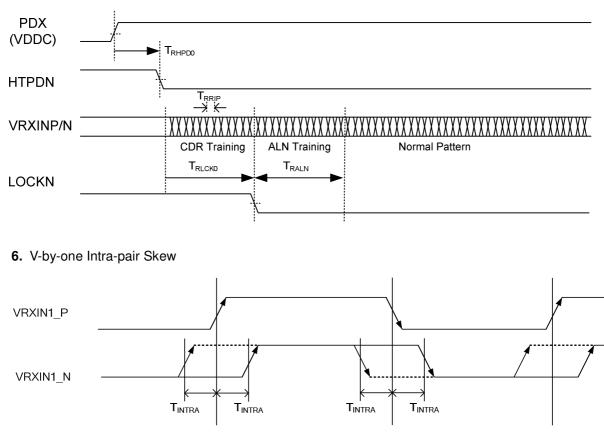

- 1. Test Condition:
 - (1) $V_{DD} = 12.0V$
 - (2) Fv = Type Timing, 60Hz, 120Hz or Other
 - (3) Fclk= Max freq.
 - (4) Temperature = 25 °C
 - (5) Typ. Input current : White Pattern Max. Input current: Heavy loading pattern defined by AUO

>> refer to "Section:3.3 Signal Timing Specification, Typical timing"

2. Measurement condition : Rising time = 400us

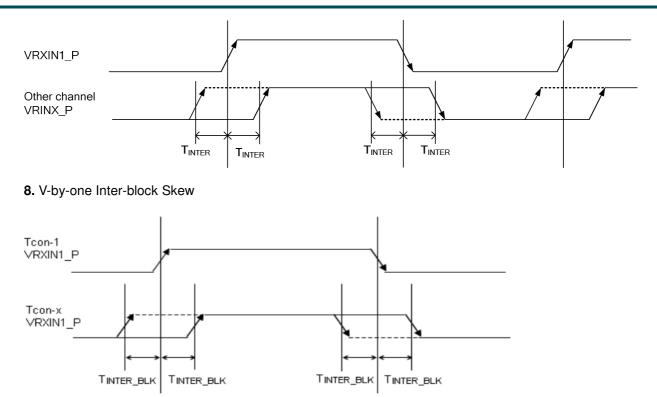

- 3. Test Condition:
 - (1) The measure point of V_{RP} is in LCM side after connecting the System Board and LCM. (2) Under Max. Input current spec. condition.
- 4. The measure points of V_{IH} and V_{IL} are in LCM side after connecting the System Board and LCM.

5. V-by-one Receiver start up timing waveform

7. V-by-one Inter-pair Skew

DE is H total (Th)

>> Th refer to "Section: 3.3 Signal Timing Specification

3.3 SIGNAL TIMING SPECIFICATION

This is the signal timing required at the input of the user connector. All of the interface signal timing should be satisfied with the following specifications for its proper operation.

Timing Table (DE only Mode)

Signal	ltem	Symbol	Min.	Тур.	Max	Unit
	Period	Τv	2180	2250	2715	Th
Vertical Section	Active	Tdisp (v)		2160		
	Blanking	Tblk (v)	20	90	555	Th
	Period	Th	274	275	300	Tclk
Horizontal Section	Active	Tdisp (h)		240		
	Blanking	Tblk (h)	34	35	60	Tclk
Clock	Frequency	Fclk=1/Tclk	66	74.25	75	MHz
Vertical Frequency	Frequency	Fv	94	120	122	Hz
Horizontal Frequency	Frequency	Fh	240	270	278.4	KHz

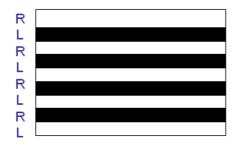

Notes:

(1) Display position is specific by the rise of DE signal only.

Horizontal display position is specified by the rising edge of 1st DCLK after the rise of 1st DE, is displayed on the left edge of the screen.

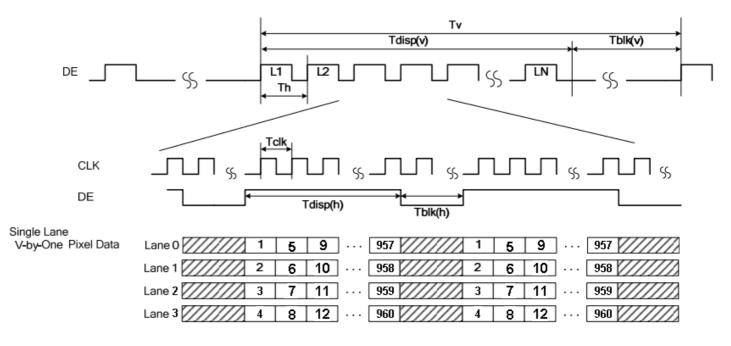

- (2)Vertical display position is specified by the rise of DE after a "Low" level period equivalent to eight times of horizontal period. The 1st data corresponding to one horizontal line after the rise of 1st DE is displayed at the top line of screen.
- (3) If a period of DE "High" is less than 3840 DCLK or less than 2160 lines, the rest of the screen displays black.
- (4)The display position does not fit to the screen if a period of DE "High" and the effective data period do not synchronize with each other.

(5) Under 3D mode, signal should be input as following sequence: 1st line: right eye, 2nd line: left eye (when rotate function is not implemented and Tcon position is at panel upper side).

3.4 SIGNAL TIMING WAVEFORMS

3.5 COLOR INPUT DATA REFERENCE

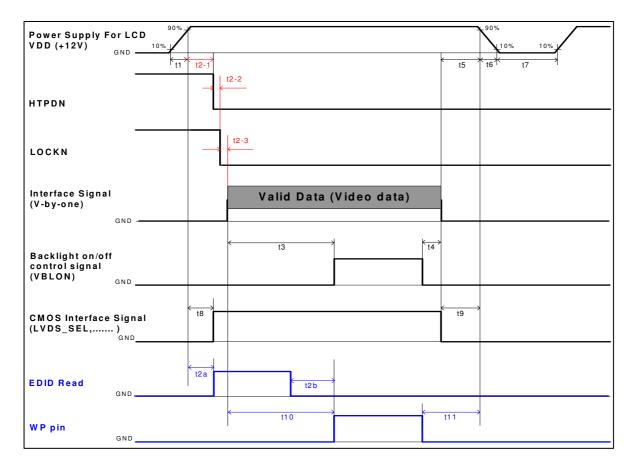

The brightness of each primary color (red, green and blue) is based on the 10 bit gray scale data input for the color; the higher the binary input, the brighter the color. The table below provides a reference for color versus data input.

														Ir	put	Co	or D	Data	ι												
	Color					RE	ED								0	GRI	EEN	I								BL	UE				
	00101	MS	SB							L	SB	M	SB							L	SB	MS	BB							L	SB

Note:

(1) t2-2 : V by One training time after power-on. The timing of HTPDN falling edge to LOCKN falling edge decided by customer system.

- (2) t4=0 : concern for residual pattern before BLU turn off.
- (3) t6 : voltage of VDD must decay smoothly after power-off. (customer system decide this value)
- (4) When CMOS Interface signal is N.C. (no connection), opened in Transmitted end, t8 timing spec can
- be negligible.
- (5) t2-1: VDD rising(90%) to HTPDN falling edge
 - t2-2: CDR lock time (CDR training)
 - t2-3: ALN training

4. OPTICAL SPECIFICATION

Optical characteristics are determined after the open cell unit and light source has been 'ON' and stable for approximately 45 minutes in a dark environment at 25 °C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of φ and θ equal to 0°.

Fig.1 presents additional information concerning the measurement equipment and method.

Demonster	O make a l	Quanditian		Values		Unit	Natas

3D cross talk (middle)				1	3	%	

© Copyright AUO Optronics Corp. 2012 All Rights Reserved.

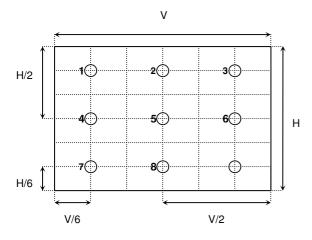

- 1. Light source here is the BLU of AUO T650QVD01.0 module.
- 2. Contrast Ratio (CR) is defined mathematically as:

Surface Luminance of L_{on5}

Surface Luminance of Loff5

3. The white variation, δ WHITE is defined as:

 $\delta_{\text{WHITE(9P)}} = Maximum(L_{on1}, L_{on2}, \dots, L_{on9}) / Minimum(L_{on1}, L_{on2}, \dots, L_{on9})$

4. Response time T_Y is the average time required for display transition by switching the input signal for five luminance ratio (0%,25\%,50\%,75\%,100\% brightness matrix) and is based on F_y=120Hz to optimize.

Ме	asured		Target												
Respo	onse Time	0%	25%	50%	75%	100%									
	0%		0% to 25%	0% to 50%	0% to 75%	0% to 100%									
	25%	25% to 0%		25% to 50%	25% to 75%	25% to 100%									
Start	50%	50% to 0%	50% to 25%		50% to 75%	50% to 100%									
	75%	75% to 0%	75% to 25%	75% to 50%		75% to 100%									
	100%	100% to 0%	100% to 25%	100% to 50%	100% to 75%										

The response time is defined as the following figure and shall be measured by switching the input signal for "any level of gray(bright) " and "any level of gray(dark)".

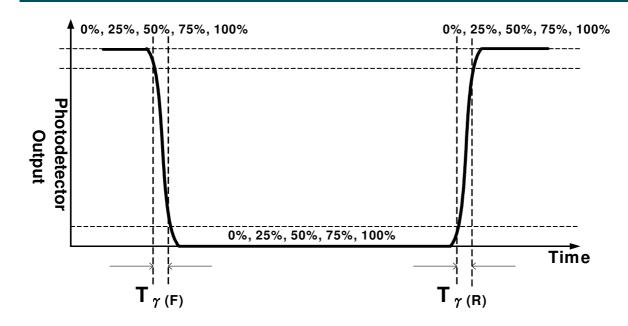

FIG.3 Response Time

Any level of gray (Bright)

Any level of gray (Dark)

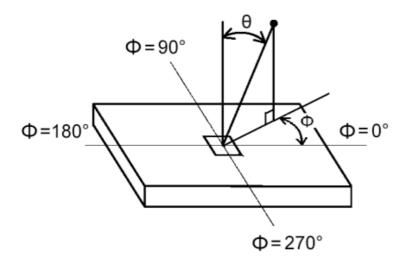

Any level of gray (Bright)

- 5. Light source here is the standard light source "C" which is defined by CIE and driving voltages are based on suitable gamma voltages. The calculating method is as following :
 - A. Measure the "Module" and "BLU" optical spectrums (W, R, G, B).
 - B. Calculate cell spectrum from "Module" and "BLU" spectrums.
 - C. Calculate color chromaticity by using cell spectrum and the spectrum of standard light source "C".
- 6. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD surface. For more information see FIG4.

FIG.4 Viewing Angle

7. Definition of Transmittance (T%):

Transmittance = $\frac{\text{Luminance of LCD module}}{\text{Luminance of backlight}} * 100\%$

During transmittance measurement, the backlight of LCD module contains no brightness enhancement film. Two diffuser sheets which diffuse the light source uniformly are suggested to use for transmittance measurement.

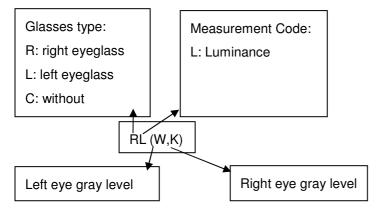

8. 3D performance specification here defines 3D Crosstalk and 3D viewing angle. 3D crosstalk is measured at panel center point under wearing glass condition.

a. Cross talk (middle) is defined by observation position which is 1.7m distance from panel center point and human head in 0 degree steady vertical angle from panel mid axis level.

b. Cross talk (in vertical viewing angle) is defined by observation position which is 1.7m distance from panel center point and observation range within specified degrees of vertical angle from panel mid axis level, and the value is limited by 10%.

For more information, refer to 9-4 3D Measurement of 3D view angle.

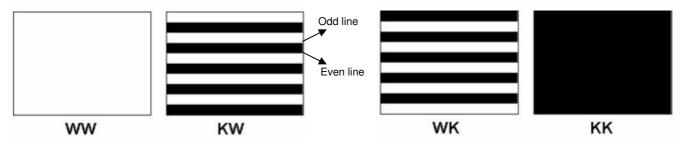

8-1 Notation of measurement.

8-2 Measurement Configuration

4-test patterns (first character refers to Left eye gray level; second one refers to Right eye gray level).

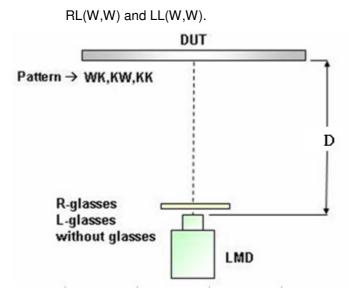

W is defined as brightness gray level; K is defined as dark state where black and white lines are displayed on even or odd lines.

- 8-3 Measurement of 3D Crosstalk
 - a. Test patterns KW, WK and KK are displayed, measuring distance is 1.7m.
 - b. Right or left eyeglass is placed in front of SR3 or equivalent equipment (as FIG1 showed) successively

and luminance is measured at panel center point where the notation for luminance measurement is

 $Crosstalk_{R} = \frac{R_{L}(W, K) - R_{L}(K, K)}{R_{L}(K, W) - R_{L}(K, K)} \times 100\%$ $Crosstalk_{L} = \frac{L_{L}(K, W) - L_{L}(K, K)}{L_{L}(W, K) - L_{L}(K, K)} \times 100\%$

 $Crosstalk = \frac{Crosstalk_{R} + Crosstalk_{L}}{2}$

	after packing	80 (by Sea)	1660(L)mm*1150(W)mm*2400(H)mm (by Sea)	600(by Sea)	40ft HQ					

7. PRECAUTIONS

Please pay attention to the followings when you use this TFT LCD Open Cell unit.

7.1 MOUNTING PRECAUTIONS

(1) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the cell. And the frame on which a cell is mounted should have sufficient strength so that external force is not transmitted directly to the cell.

(2) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to the resist external force.

(3) You should adopt radiation structure to satisfy the temperature specification.

(3) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.

(4) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth. (Some cosmetics are detrimental to the polarizer.)

(5) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzene. Normal-hexane is recommended for cleaning the adhesives used to attach front/ rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.

(6) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.

(7) Do not open the case because inside circuits do not have sufficient strength.

7.2 OPERATING PRECAUTIONS

(1) The open cell unit listed in the product specification sheets was designed and manufactured for TV application

(2) The spike noise causes the mis-operation of circuits. It should be lower than following voltage:

V=±200mV(Over and under shoot voltage)

- (3) Response time depends on the temperature. (In lower temperature, it becomes longer.)
- (4) Brightness/transmittance depends on the temperature. (In lower temperature, it becomes lower.) And in lower temperature, response time (required time that brightness is stable after turned on) becomes longer.

(5) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer

or electrical contacted parts. And after fading condensation, smear or spot will occur.

(6) When fixed patterns are displayed for a long time, remnant image is likely to occur.

(7) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimize the interface.

7.3 ELECTROSTATIC DISCHARGE CONTROL

Since a open cell unit is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc. And don't touch interface pin directly.

7.4 PRECAUTIONS FOR STRON LIGHT EXPOSURE

Strong light exposure causes degradation of polarizer and color filter.

7.5 STORAGE

When storing open cell units as spares for a long time, the following precautions are necessary.

(1) Store them in a dark place. Do not expose the open cell unit to sunlight or fluorescent light. Keep the temperature between 5℃ and 35℃ at normal humidity.

(2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.

7.6 HANDLING PRECAUTIONS FOR PROTECTION FILM OF POLARIZER

The protection film of polarizer is still attached on the surface as you receive open cell units. When the protection film is peeled off, static electricity is easily generated on the polarizer surface. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
