

TENTATIVETOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT
SILICON MONOLITHIC

TA1310BN

BUILT-IN VIDEO, CHROMA, AND SYNC SIGNAL PROCESSOR AND DEFLECTION CORRECTION IC FOR NTSC COLOR TV (YUV INTERFACE SUPPORTED)

TA1310BN incorporates a function for processing the video, chroma, and sync signals required for NTSC color TV and a function for correcting deflection.

The IC comes in a 56-pin shrink dual-in-line package (DIP). TA1310BN uses the I²C bus to control and make settings for the internal functions.

FEATURES

Video Signal Processing

- Built-in Y delay line
- Black stretch
- DC restoration ratio compensation
- Aperture controlled sharpness
- Output for velocity scan modulation (VSM)
- White peak suppression (WPS)

Chroma Signal Processing

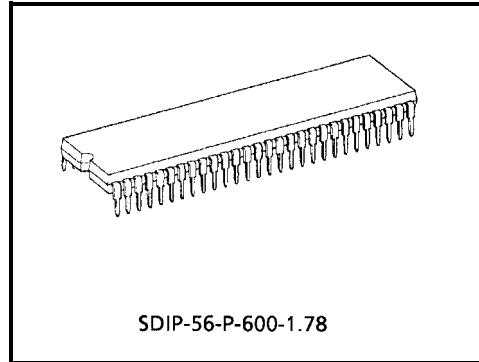

- Built-in chroma BPF / TOF
- R-Y and B-Y outputs
- Color / BW situation output by read bus

Sync Signal Processing

- Counts down 32 fH
- Dual AFC
- Vertical AGC
- HD and VD outputs
- Vertical frequency fixed mode
- Horizontal and Vertical position alignment
- DC outputs for vertical centering
- X-ray Protection (Hold Down)

Text Signal Processing

- Analog RGB inputs
- Halftone switch (YM)
- Cutoff and drive alignment
- YUV inputs

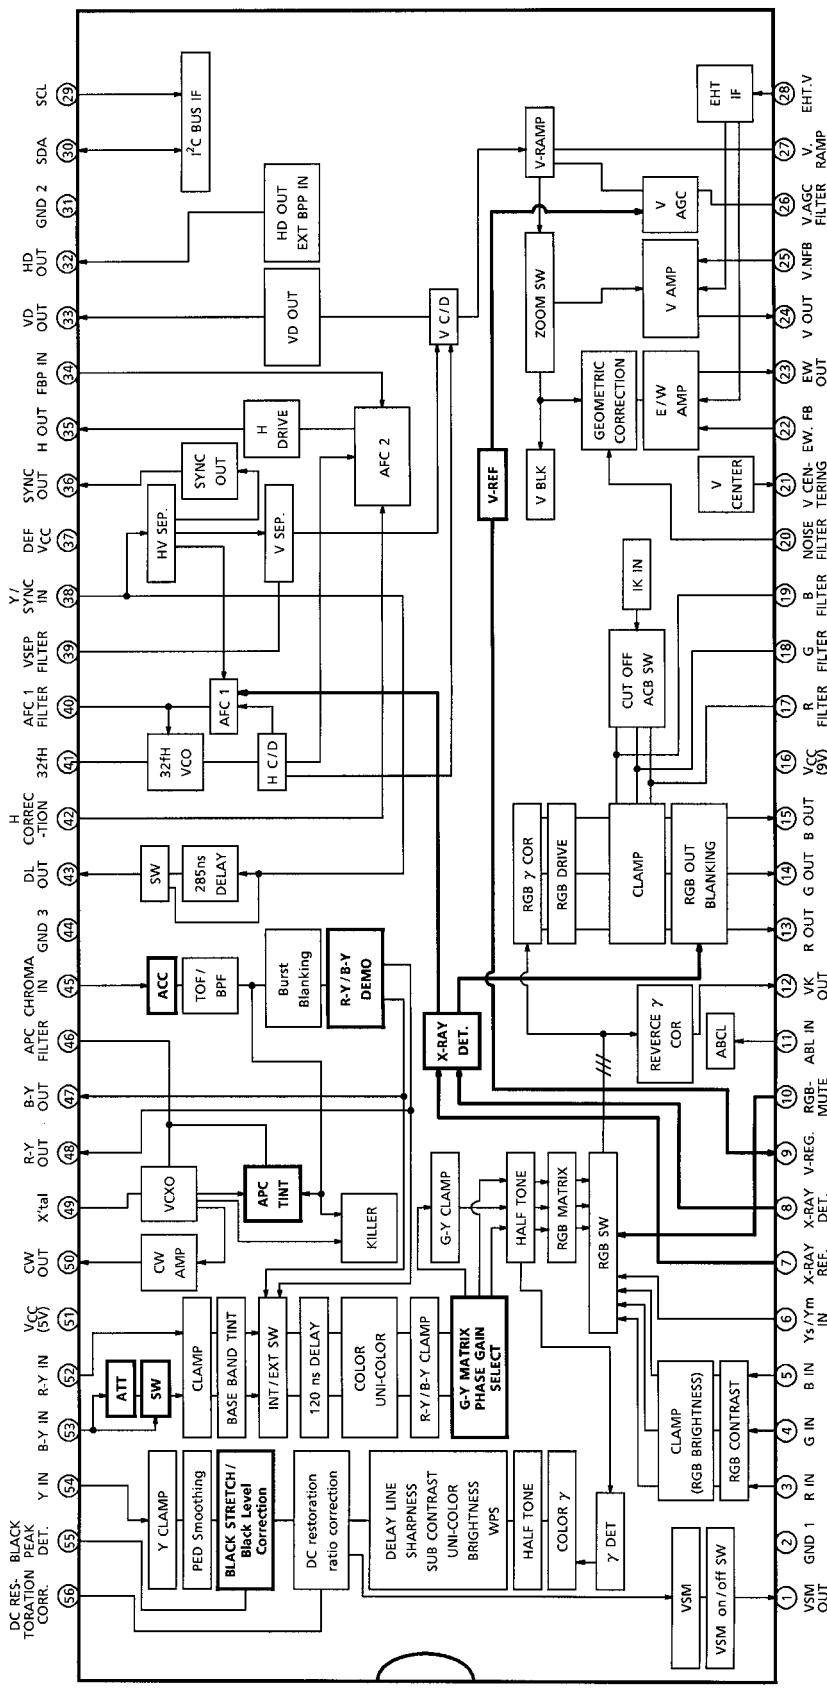

SDIP-56-P-600-1.78

Weight: 5.55 g (Typ.)

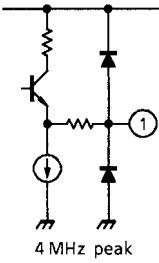

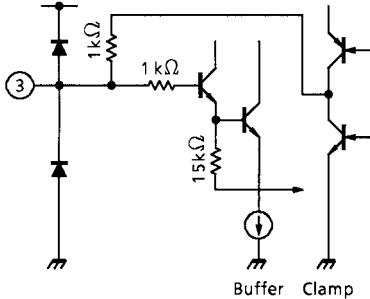

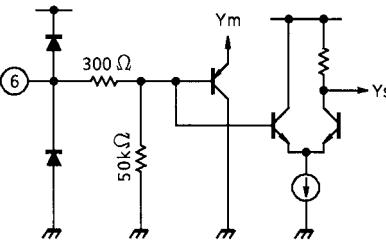

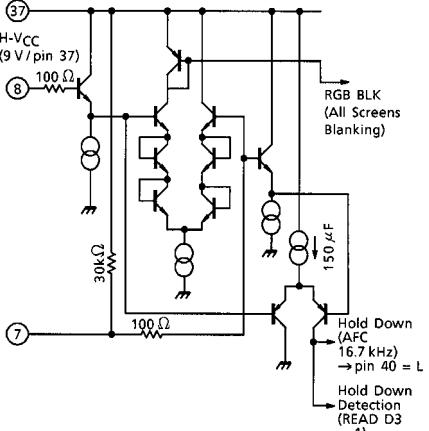

Deflection Correction Function

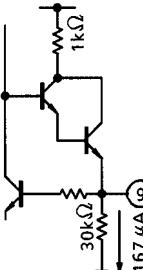

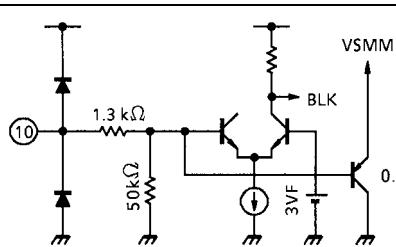

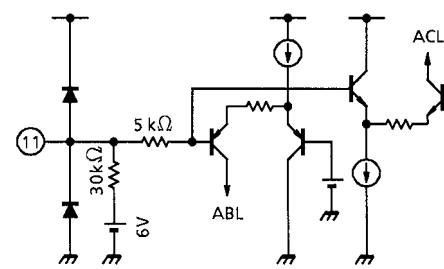

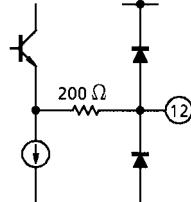

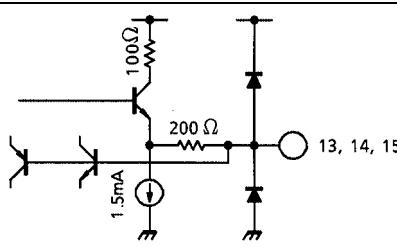

- Horizontal and Vertical amplitude adjustment
- Vertical linearity correction
- Vertical S correction
- Vertical EHT correction
- E / W parabola correction
- E / W corner correction
- E / W trapezium correction
- Regulated bias for V-AGC

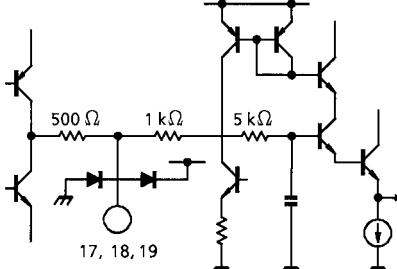

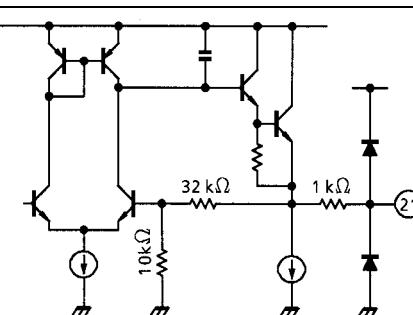

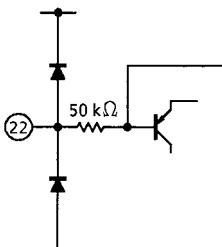

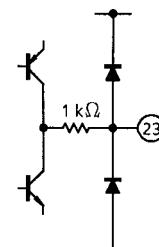

BLOCK DIAGRAM

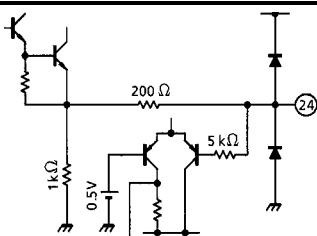

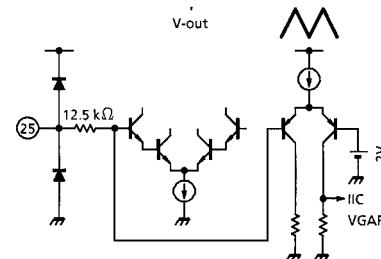

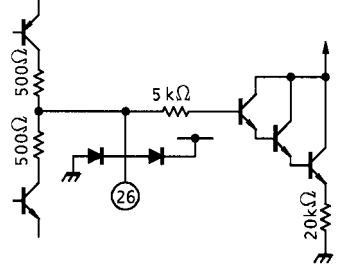

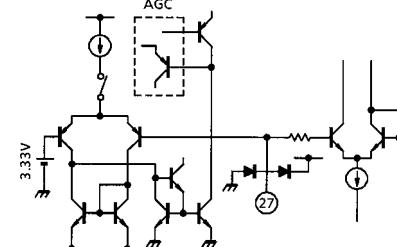

PIN FUNCTION

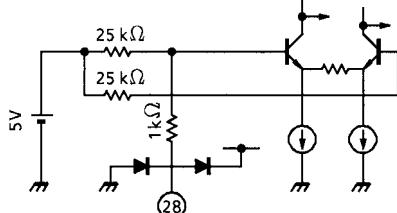

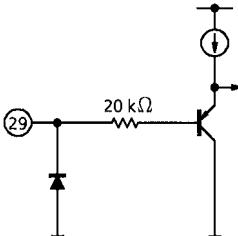

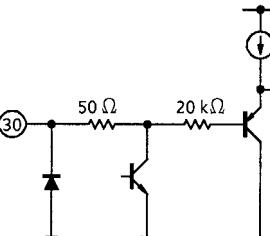

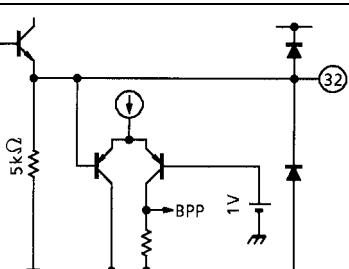

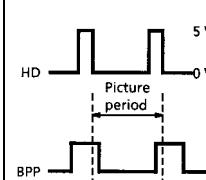

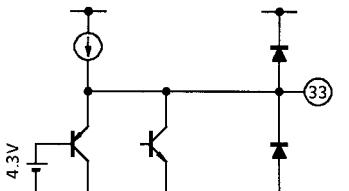

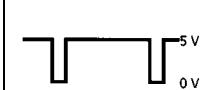

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
1	VSM OUT	VSM means Verocity Scanning Modulation.		
2	GND I	The terminal for GND of Video / Y / TEXT circuits.	—	
3 4 5	R _{IN} G _{IN} B _{IN}	The terminals for Analog RGB signal input. Input signals clamped by coupling capacitors. (*) : Even when not in use, connect to GND with a coupling capacitor.		100 IRE = 0.5 V _{p-p} 3.7V
6	Y _S / Y _M IN	The terminal for switching of Analog RGB Mode and Half tone.		RGB 2.1V Half Tone 0.7V TV GND
7	X-ray ref.	These terminals, pin 7 and pin 8, are for X-ray protection (Hold Down). Input DC at pin 7 is reference bias.		Vz + VF (= 6.8 V) Vz (= 6.15 V) GND
8	X-ray H-IN	(*) : In case of unuse, these terminals should be pulled down to GND with resistors to avoide malfunction by noise.		

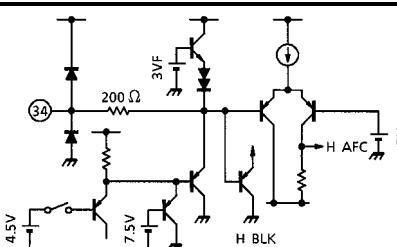

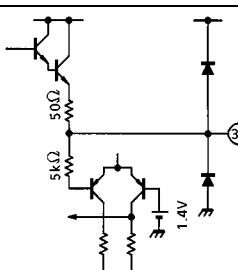

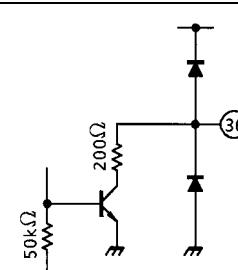

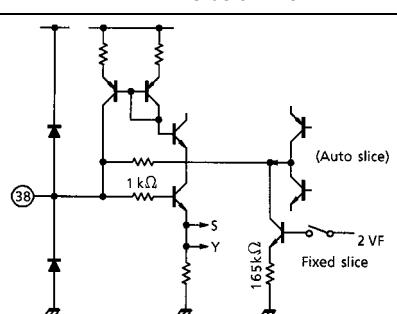

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
9	V-reg.	Regulated bias for Vertical AGC generates at this terminal. The bias is based on Band-gap voltage. (*) : In case of unused, this terminal should be pulled down to GND with resistor to avoid malfunction by noise.		DC ; 5 V
10	RGB-MUTE	Control terminal for muting RGB outputs (Pin 13, 14, and 15).		RGB BLK Analog RGB 2.8 V RGB ON 2.1 V
11	ABL IN	The terminal for the external unicolor and brightness control. ABL Gain and ABL start point can be set by using BUS.		OPEN 6.0 V
12	VK OUT	The terminal outputs signal in order to input in H-correction (Pin 42). The signal corresponds to RGB signal.		
13 14 15	R OUT G OUT B OUT	The terminals for RGB signal output.		

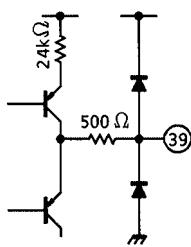

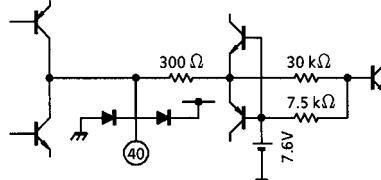

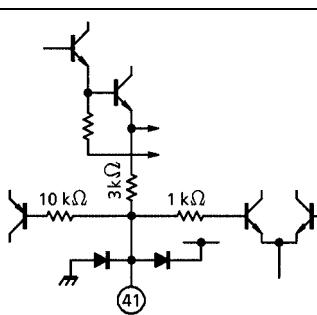

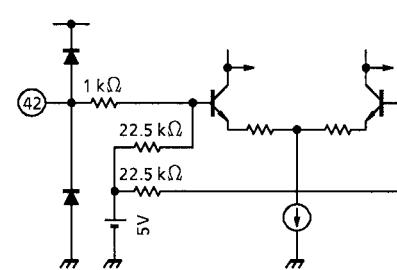

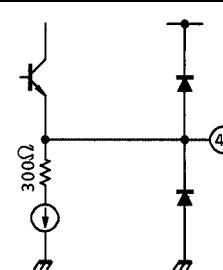

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
16	V _{CC} (9 V)	The terminal for V _{CC} Supply 9 V. The terminals is connected to 9 V (typ.).	—	
17 18 19	R Filter G Filter B Filter	Control the RGB output cutoff voltage, holding the standard pulse period comparator output to one vertical period. For this control, use the bus function RGB cutoff. The filters must be low leakage current filters.		
20	NOISE FILTER	DAC E / W trapezium-correction output. Connect to GND with a 0.47-μF coupling capacitor.		
21	V Centering	The terminal for the DAC output that controlled by BUS (V-center).		
22	EW FB	The terminal for E / W feedback.		
23	EW OUT	The terminal for output of E / W drive signal.		

PIN FUNCTION

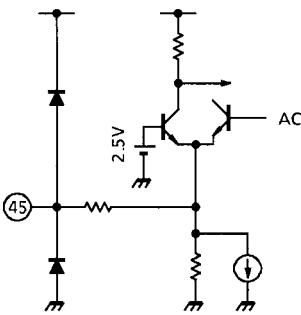

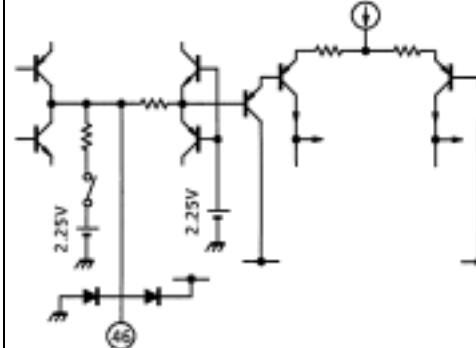

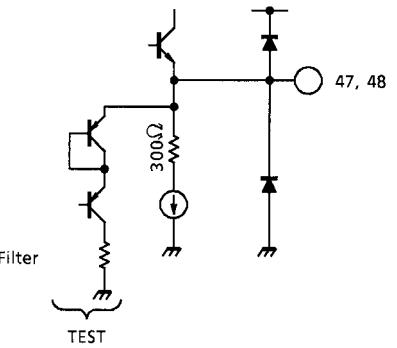

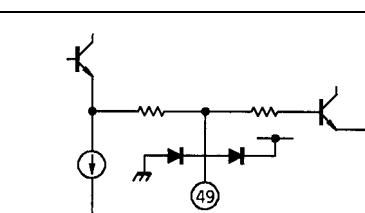

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
24	V OUT	The terminal for output of Vertical drive signal.		
25	V NFB	The terminal for input of Vertical negative feedback. If input voltage is less than 2 V, V-Guard function works and blanks RGB signal output.		
26	V AGC Filter	The terminal to be connected a capacitor for Automatic gain control of Vertical RAMP signal.		
27	V RAMP	The terminal to be connected a capacitor to generate Vertical RAMP signal.		

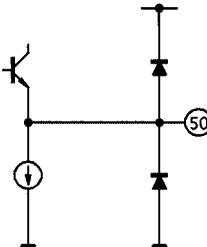

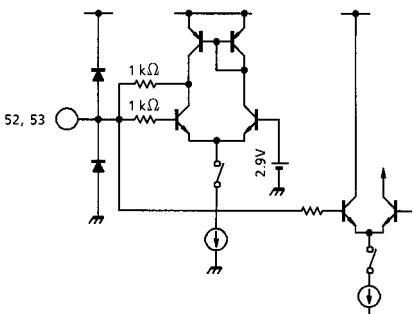

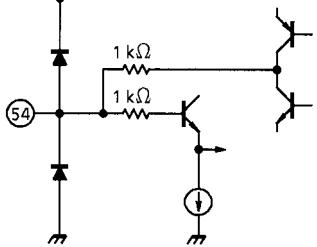

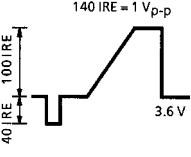

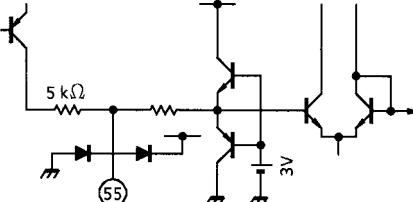

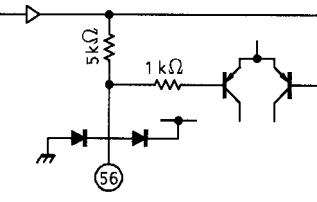

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
28	EHT V	The terminal for the Vertical EHT input.		
29	SCL	The terminal for input of I ² C BUS clock.		
30	SDA	The terminal for input / output of I ² C BUS data.		
31	GND II	The terminal for the GND of DEF / I ² C / EW.	—	
32	HD OUT	The terminal for the HD pulse. The suspension period of the Black peak stretching is extended by inputting the external pulse.		
33	VD OUT	The terminal for the VD pulse.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
34	FBP IN	The terminal for the flyback pulse to control H-BLK and H-AFC.		H-AFC.....-5 V H-BLK.....-1.4 V
35	H OUT	The terminal for the Horizontal output.		5 Vp-p
36	SYNC OUT	The terminal for output of the synchronizing signal that was separated in the synchronous separation circuit. This terminal is of the open collector system. Connect the pull-up resistor.		
37	DEF VCC	The terminal for VCC supply 9 V of DEF.	(Caution) Be sure to design the power supply so that when the power is Off, DEF VCC is below 1.9 V.	
38	Y / SYNC IN	The terminal for input of the synchronous separation circuit. Input via clamp capacitor.		1 Vp-p

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
39	V SEP Filter	The terminal to be connected a capacitor for the Vertical synchronous separation circuit.		
40	AFC I Filter	Connect the filter for horizontal AFC I detection. The frequency of the horizontal output varies depending on the voltage at this pin.		
41	32 fh VCO	Connect the ceramic oscillator for horizontal oscillation. The oscillator to be used is CSBLA503KECFZ30, made by Murata electronics.		
42	H Correction	The terminal to correct distortion of picture in the case of high-tension fluctuation. Input the AC component of high tension fluctuation. This terminal can be inputted VK output (Pin 12).		
43	DL OUT	The terminal outputs delayed Y signal. Input this signal to Y IN (Pin 54) via a capacitor.		
44	GND III	The terminal for GND of DEF linear / Chroma circuits.	—	

PIN FUNCTION

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
45	CHROMA IN	The terminal for the chroma input.		DC : 1.77 V AC : Burst 286 mV _{p-p}
46	APC	The terminal to be connected APC filter. The oscillation frequency of VCxo varies depending on the voltage at this pin.		
47	B-Y OUT	B-Y OUT		DC : 2.2 V AC : 300mV _{p-p} (Rainbow color bar)
48	R-Y OUT	R-Y OUT		DC : 2.2 V AC : 300 mV _{p-p} (Rainbow color bar)
49	X'tal	The terminal to be connected with a 3.579545 MHz X'tal oscillator. The oscillated frequency, f_0 , is controlled by series capacitors, and frequency adjustment range can be expanded by putting capacitors in parallel.		

PIN No.	SYMBOL	FUNCTION	INTERFACE	I / O SIGNAL
50	CW OUT	The terminal for CW output generated in VCXO.		
51	V _{CC} (5 V)	The terminal for V _{CC} supply 5 V.	—	
52 53	R-Y IN B-Y IN	The terminals for the R-Y / B-Y signal input. Input signals clamped by coupling capacitors. (*) : Even when not in use, connect to GND with a coupling capacitor.		
54	Y IN	The terminal for the Y signal input. Input the Y signals clamped by coupling capacitors.	 	
55	BLACK PEAK DET	The terminal to be connected the filter controlling the black stretching gain of the black stretching circuit. The black stretching gain varies depending on the voltage at this pin.		
56	DC RESTORAT ION CORR.	The terminal to be connected capacitor for DC restoration correction control. Open this pin if not use the DC restoration correction.

I²C BUS COMMUNICATIONS, RECEIVE METHOD

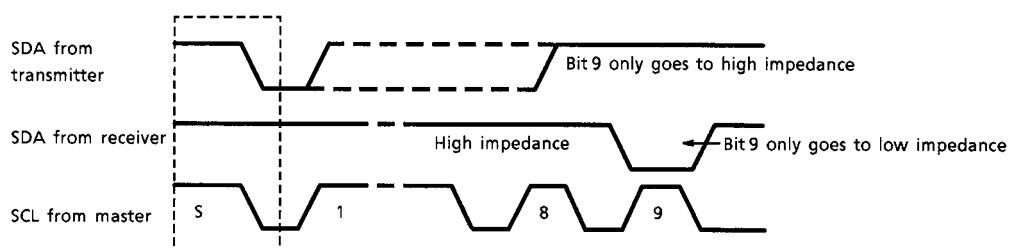

Start and stop condition

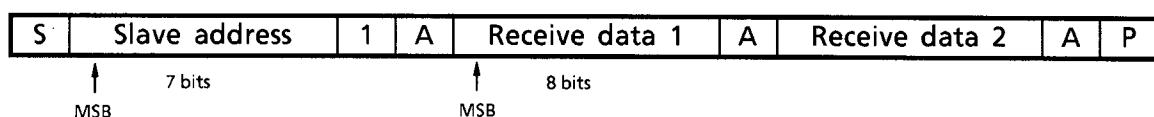

Bit transfer

Acknowledgement

Data receive format

When data are received, the master transmitter changes to a receiver immediately after the first acknowledgement and the slave receiver changes to a transmitter.

The master always creates the stop condition.

Details are provided in the Philips I²C specifications.

Option data transmit format

In the above method, the subaddresses are automatically incremented from the specified subaddress and data are set.

Purchase of TOSHIBA I²C components conveys license under the Philips I²C patent Rights to use these components in an I²C system, provided that the system conforms to the I²C standard specification as defined by Philips.

MAXIMUM RATINGS (Ta = 25°C)

CHARACTERISTICS	SYMBOL	RATING	UNIT

NOTE	ITEM	SW MODE			(TEST CONDITIONS $V_{CC} = 9\text{ V}$ / 5 V , $T_a = 25 \pm 3^\circ\text{C}$)		MEASUREMENT METHOD
		SW#4	SW#5	SW#6			
P ₁	#54 Voltage (Y Input Pedestal Clamp Voltage)	C	OPEN	OPEN	1) Set the bus control data to the preset value. 2) Measure the #54 DC voltage V_{54} .		
P ₂	#55 Voltage	C	OPEN	OPEN	1) Set the bus control data to the preset value. 2) Measure the #55 DC voltage V_{55} .		
P ₃	#56 Voltage	C	OPEN	OPEN	1) Set the bus control data to the preset value. 2) Measure the #56 DC voltage V_{56} .		
P ₄	#1 Voltage	C	OPEN	ON	1) Set the bus control data to the preset value. 2) Measure the #1 DC voltage V_1 .		
					1) Set the bus control data to the preset value. 2) Set SW54 to C (connect the Y input to AC-GND). 3) Measure #56 with an oscilloscope as shown in the diagram and calculate ΔVPC . 4) Calculate the voltage differences $\Delta VPC1$ and $\Delta VPC0$ when the Y mute is on (1) and off (0).		
P ₅	Y Input Pedestal Clamp Error Voltage	C	OPEN	OPEN	#56 (DC transfer rate correction) #34 (FBP input)		

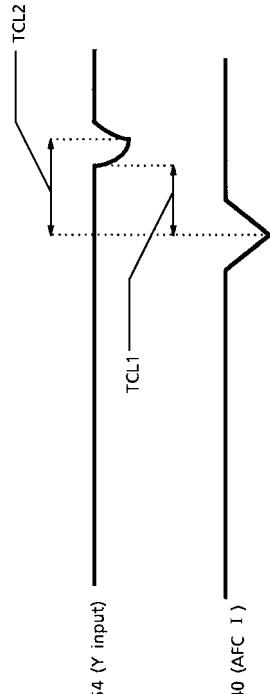

Note 1: When testing, see the picture sharpness test circuit diagram.

Note 2: Ensure the composite signal is always input to pin 38 (SYNC IN).

NOTE	ITEM	SW MODE				(TEST CONDITIONS V _{CC} = 9 V / 5 V, T _a = 25 ± 3°C)		MEASUREMENT METHOD
		SW ₅₄	SW ₅₅	SW ₅₆	SW ₅₆			
P ₆	Y Input Pedestal Clamp Pulse Phase	B	B	OPEN	#54 (Y input)	1) Set the bus control data to the preset value. 2) Set SW ₅₄ to B (connect V _{CC} (5 V) to the Y input via a 20-kΩ resistor). 3) Measure #54 and #40 with an oscilloscope as shown in the diagram. Calculate TCL1 and TCL2.		
P ₇	Y Input Dynamic Range	C	B	OPEN	#40 (AFC 1)	1) Set the bus control data to the preset value. 2) Set SW ₅₄ to C (connect the Y input to AC-GND). 3) Set the unicolor to the center (100000), the brightness to the center (1000000), RGB cutoff to the center (10000000), the Y mute to OFF (0), and connect an external power supply to #54. 4) Increase the supply voltage from V ₅₄ and measure #13 (ROUT). 5) When the #13 voltage stops changing, substitute the supply voltage (V) in the formula below and calculate DR ₅₄ . $DR_{54} = V - V_{54}$		

Note 1: When testing, see the picture sharpness test circuit diagram.

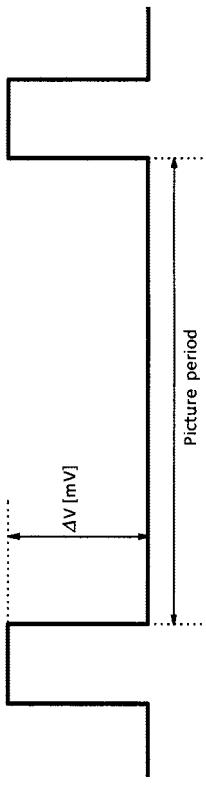

Note 2: Ensure the composite signal is always input to pin 38 (SYNC IN).

NOTE	ITEM	SW MODE				(TEST CONDITIONS V _{CC} = 9 V / 5 V, T _a = 25 ± 3°C)		MEASUREMENT METHOD
		SW ₅₄	SW ₅₅	SW ₅₆				
P ₈	#56 Output Impedance	C	B	OPEN				<p>1) Set the bus control data to the preset value.</p> <p>2) Set SW₅₄ to C (connect the Y input to AC-GND).</p> <p>3) Connect the external power supply to #56 via ammeter A as shown in the diagram below.</p> <p>4) Adjust the power supply until the ammeter reads 0 amperes.</p> <p>5) Measure the ammeter current I₅₆ when the power supply is increased by 0.1 V.</p> <p>6) Calculate Z₅₆ from the following formula.</p> $Z_{56} = 0.1 [V] \div I_{56} [A]$
P ₉	Black Stretching Amplifier Maximum Gain	A	B	↓	OPEN			<p>1) Set the bus control data to the preset value.</p> <p>2) Set the black stretch start point to 001, turn the Y mute off (0), set SW₅₄ to A, and input a 500-kHz sine wave to TP54A.</p> <p>3) Use #54 to adjust the signal amplitude to 0.1 V_{p-p}.</p> <p>4) Set SW₅₅ to B (minimum gain) and measure the amplitude V_A of #56.</p> <p>5) Set SW₅₅ to A (maximum gain) and measure the amplitude V_B of #56.</p> <p>6) Calculate G_{BS} from the following formula.</p> $G_{BS} = V_B \div V_A$

Note 1: When testing, see the picture sharpness test circuit diagram.

Note 2: Ensure the composite signal is always input to pin 38 (SYNC IN).

NOTE	ITEM	SW MODE				(TEST CONDITIONS $V_{CC} = 9V / 5V$, $T_a = 25 \pm 3^\circ C$)		MEASUREMENT METHOD
		SW54	SW55	SW56				
P10	Black Level Compensation	C	A	OPEN				<p>1) Set the bus control data to the preset value.</p> <p>2) Set SW54 to C (connect the Y input to AC-GND), set SW55 to A (maximum gain), turn the Y mute off (0), and turn the black level compensation on (set the black stretch start point to 000).</p> <p>3) Observe #56, measure ΔV, and calculate the following formula.</p> $B_{LC} [(\text{IRE})] = (\Delta V [\text{mV}] \div (0.7 \times 10^3) [\text{mV}]) \times 100 [(\text{IRE})]$ 
P11	Black Peak Detection Level	C	C	OPEN				<p>1) Set the bus control data to the preset value.</p> <p>2) Turn the Y mute off (0) and connect #54 to an external power supply (PS).</p> <p>3) Turn the black level correction on (set the black stretch start point to 000).</p> <p>4) Increase the PS from 3V and measure the voltage VBP of #56 where the DC level of the picture period of #55 shifts from high to low.</p> <p>5) Calculate Δv_{BP} from the following formula.</p> $\Delta v_{BP} = V_{BP} - V_{56}$

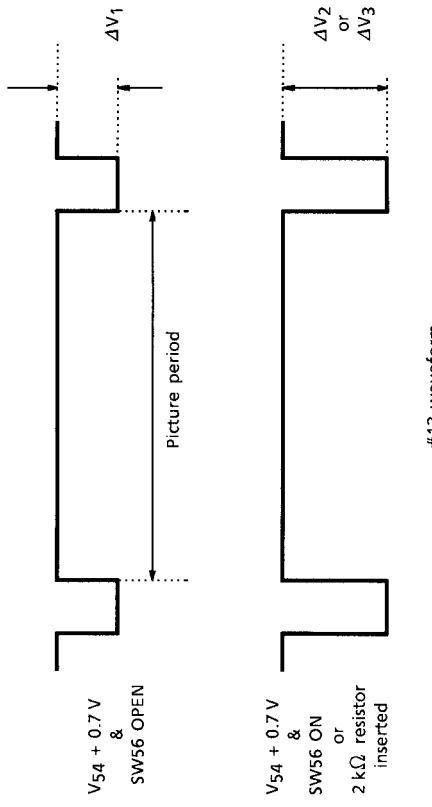

Note 1: When testing, see the picture sharpness test circuit diagram.

Note 2: Ensure the composite signal is always input to pin 38 (SYNC IN).

NOTE	ITEM	(TEST CONDITIONS $V_{CC} = 9V / 5V, Ta = 25 \pm 3^\circ C$)			MEASUREMENT METHOD	
		SW MODE	SW 54	SW 55	SW 56	
						<p>1) Set the bus control data to the preset value.</p> <p>2) Set SW₅₄ to C (connect the Y input to AC-GND), set SW₅₅ to B (minimum gain), turn the Y mute off (0), and set the black stretch start point to 001.</p> <p>3) Connect #54 to an external power supply (PS), increase the voltage from V₅₄, and plot the resulting change in voltage S₁ of #56.</p> <p>4) Next, set SW₅₅ to A (maximum gain). Then, increase the voltage from V₅₄ as in 3) above and plot the resulting change in voltage S₂ of #56.</p> <p>5) Now set the black stretch point to 111 and plot S₃ as in 3) above.</p> <p>6) Use the diagram below to calculate the intersection V_{B001} of S₁ and S₂, and the intersection V_{B111} of S₁ and S₃. Use the following formulas to calculate P_{B001} and P_{B111}, and calculate P_{B001} and P_{B111} from the formulas below.</p> $P_{B001} \text{ [IRE]} = ((V_{B001} \text{ [V]} - V_{56} \text{ [V]} + 0.7 \text{ [V]}) \times 100 \text{ [%IRE]})$ $P_{B111} \text{ [IRE]} = ((V_{B111} \text{ [V]} - V_{56} \text{ [V]} + 0.7 \text{ [V]}) \times 100 \text{ [%IRE]})$
P12	Black Stretching Start Point	B	C	A	OPEN

	P24	VSM Phase	A	B	OPEN			<p>1) Set the bus control data to the present value.</p> <p>2) Input a signal like that shown in the diagram below to TP54, turn the Y mute off (0), and adjust the amplitude of #54 to 0.7 V_{p-p}.</p> <p>3) Set the unicolor to the maximum (11111), increase the picture sharpness from the minimum to a level where the R OUT waveform is not distorted.</p> <p>4) Measure the phase differences τ_{VM24}, τ_{VMFP}, and τ_{VM2T} between TP1 (VSMOUT) and TP13 (R OUT) when the signal is an FVSM sine wave, a 2T pulse, and a 2.4-MHz signal, as shown in the diagram below. (To make a waveform at TP1, reverse the waveform at TP13 using an oscilloscope.)</p>

Note 1: When testing, see the picture sharpness test circuit diagram.

Note 2: Ensure the composite signal is always input to pin 38 (SYNC IN).

Chroma stage

NOTE	ITEM	SW MODE		#16 V _{CC} = 9 V, #37 V _{CC} = 5 V, Ta = 25 ± 3°C)		MEASUREMENT METHOD
		SW45	SW46			
C ₁	ACC Characteristics	B	ON	1) Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 1 : 1 2) When the chroma input amplitude levels are set to 10, 30, 300, and 400 mV _{p-p} , measure the output amplitudes va10, va30, va300, and va400 of the R-Y output pin (TP48). 3) Calculate A = va30 / va400.		
C ₂	Color Difference Output Level	B	ON	1) Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 300 mV _{p-p} : 300 mV _{p-p} 2) Change the burst phase so that bar 2 of the B-Y output pin (TP47) output waveform is the bottom peak and bar 7 is the top peak. 3) Measure the amplitude (v _B) of the B-Y output pin (TP47). 4) Set the burst phase to 180°. 5) Measure the amplitude (v _R) of the R-Y output pin (TP48).		
C ₃	Color Difference Output Relative Amplitude	B	ON	1) Calculate the relative amplitude v _{RB} from the following formula using the values obtained in steps 3) and 5) of C ₀₂ above. $v_{RB} = v_R / v_B$ 2) Calculate the demodulation angles θ _{Bcnt} and θ _{Rcnt} of the B-Y output pin (TP47) and the R-Y output pin (TP48) using the formulas and diagram below.		
C ₄	Color Difference Output Demodulation Angle	B	ON	Peak $\theta_{Bcnt} = 0^\circ - \tan^{-1} \left[\frac{1}{\frac{2A}{B} + \sqrt{3}} \right] - 15^\circ$ (Bar 6 is the peak at B-Y) Demodulation waveform  $\theta_{Rcnt} = 90^\circ - \tan^{-1} \left[\frac{1}{\frac{2A}{B} + \sqrt{3}} \right] - 15^\circ$ (Bar 3 is the peak at R-Y)		
C ₅	Color Difference Output Relative Phase	B	ON	1) Calculate the relative phase θ _{RB} from the following formula using the values obtained in C ₀₄ above. $\theta_{RB} = \theta_{Rcnt} - \theta_{Bcnt}$		

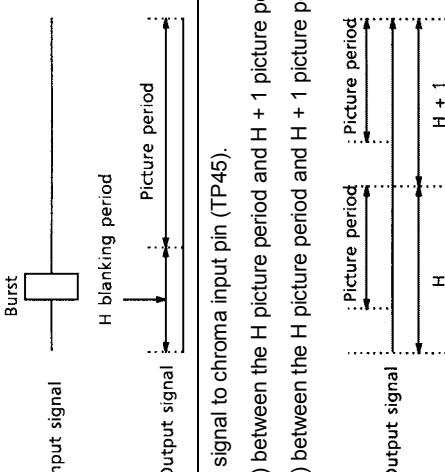

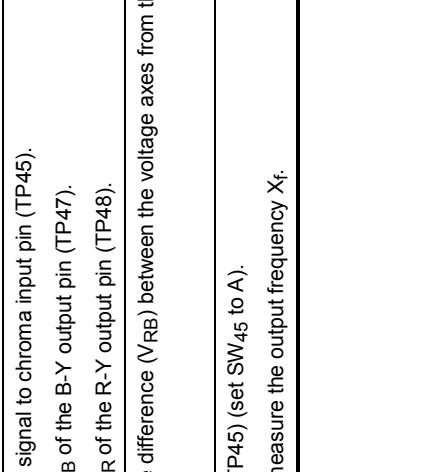

Note 1: Where the bus data are not specified, set the preset values.

Note 2: Ensure the sync signal is always input to TP38 (SYNC IN).

NOTE	ITEM	SW MODE		MEASUREMENT METHOD
		SW45	SW46	
C ₆	Color Difference Output Tint Adjustment Characteristics	B	ON	<p>(#16 V_{CC} = 9 V, #37 V_{CC} = 9 V, #51 V_{CC} = 5 V, Ta = 25 ± 3°C)</p> <p>1) Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p}</p> <p>2) Measure the demodulation angles θ_{B'} and θ_{R'} in the outputs with the tint set to the maximum (subaddress (03H), data (FE)). Calculate θ_{Bmax} and θ_{Rmax} by the following formulas.</p> $\theta_{Bmax} = \theta_{B'} - \theta_{Bcnt}$ $\theta_{Rmax} = \theta_{R'} - \theta_{Rcnt}$ <p>3) Measure the demodulation angles θ_{B''} and θ_{R''} in the outputs with the tint set to the minimum (subaddress (03H), data (00)). Calculate θ_{Bmin} and θ_{Rmin} by the following formulas.</p> $\theta_{Bmin} = \theta_{B''} - \theta_{Bcnt}$ $\theta_{Rmin} = \theta_{R''} - \theta_{Rcnt}$
C ₇	Supply Voltage Dependence of Color Difference Output	B	ON	<p>1) Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 300 mV_{p-p} : 300 mV_{p-p}</p> <p>2) As in C₀₂, measure the amplitudes ΔVBp and ΔVRp of the B-Y output pin (TP47) and R-Y output pin (TP48) when the 5-V V_{CC} is set to 5 V + 0.3 V. Calculate the amplitude ratios BVp and RVp when the 5-V V_{CC} is set to 5 V.</p> $BVp = \frac{\Delta VBp - vB}{vB} \times 100$ $RVp = \frac{\Delta VRp - vR}{vR} \times 100$ <p>3) Using the same tests as above, calculate BVn and RVn when the 5-V V_{CC} is set to 5 V - 0.3 V</p> $BVn = \frac{\Delta VBn - vB}{vB} \times 100$ $RVn = \frac{\Delta VRn - vR}{vR} \times 100$
C ₈	Identification Sensitivity	B	ON	<p>1) Input a rainbow signal (signal C-1) to the chroma input pin (TP45). Burst : chroma = 1 : 1</p> <p>2) Gradually reduce the input signal amplitude from 100 mV_{p-p}. When the B-Y output pin (TP47) signal disappears (when the current is DC), measure the input signal amplitude VCB.</p> <p>3) Gradually increase the input signal amplitude from 0 mV_{p-p}. When a demodulation signal appears on the B-Y output pin (TP47), measure the input signal amplitude VBC.</p>
C ₉	Bus Read Identification	B	ON	<p>1) Perform the same tests as above while observing the bus read. When the input signal amplitude is VCB, check that the first bit is set to 0 (bCB). When the input signal amplitude is VBC, check that the first bit is set to 1 (bBC).</p>

Note 1: Where the bus data are not specified, set the preset values.

Note 2: Ensure the sync signal is always input to TP38 (SYNC IN).

(A) Signal input to pin 34

(B) Signals output from pins 13, 14, and 15

63.5 μ s

t_{dON}

t_{dOFF}

1) Measure t_{dON} and t_{dOFF} using the signal input to pin 34 (FBN-IN) (A below) and the signals output from pins 13, 14, and 15 (B below).

- (A) Signal input to pin 34
 - (B) Signals output from pins 13, 14, and 15
- 1) Input signal 1 (f = 100 kHz, picture period amplitude = 0.2 V_{p-p}) to pin 54.

2) When the subaddress (0F, sub-contrast) data are changed to the maximum (8F), the center (88), and the minimum (80), measure the picture period amplitude of pin 13.

3) Calculate the maximum and minimum amplitude ratios in relation to the sub-contrast center in decibels.
(Δv_{SU+} , Δv_{SU-})

1) Measure the picture period amplitudes of pins 13, 14, and 15.

1) When the R cutoff (subaddress (08)) data are changed to the maximum (FF), the center (80), and the minimum (00), measure the picture period amplitude of pin 13 and calculate the change in maximum and minimum from the center.
(CUT+, CUT-)

2) Make the following changes in steps (1) and (2) above and measure:
Change the subaddress (09) data and measure pin 14.
Change the subaddress (0A) data and measure pin 15.

Change the subaddress (10) D₇~D₄ so that the #22 parabola waveform is symmetrical.</p>  <p>Set the subaddress (10) D₃~D₀ to (0) and measure the amplitude of the #22 waveform V_{CR} (0).</p> <p>Likewise, when the subaddress (10) data are set to (F), measure the #22 waveform amplitude V_{CR} (F).</p> <p>$V_{CR} = V_{CR}(F) - V_{CR}(0)$</p> 	
G17	Parabola Symmetry Correction	A	<p>Set the subaddress (10) data to (00) and measure the vertical NF center voltage of the #25 waveform V_C (00).</p> <p>Likewise, when the subaddress (10) data are set to (FC), measure the #25 voltage V_C (FC).</p> <p>$V_{TR} = \pm \frac{V_C(00) - V_C(FC)}{2 \times V_{P25}} \times 100 (\%)$</p> 	

NOTE	ITEM	SW MODE SW28	TEST CONDITIONS (DEF V _{CC} = 9 V, T _a = 25 ± 3°C, BUS DATA = POWER-ON RESET)		MEASUREMENT METHOD
G18	E-W Amp Maximum Output Current	A	Connect an ammeter between #23 and GND. Measure the current.		
G19	AGC Operating Current 1	A	Measure the TP26 waveform peak value. (V _{AGC0}) Set the subaddress (06) D ₀ to (1) and repeat the measurement (V _{AGC1})		
G20	AGC Operating Current 2	A		$I_{AGC0} = V_X \div 200 \text{ } (\mu\text{A})$ (V _{AGC1})	
G21	Vertical Guard Voltage	A	Set #25 to open. Connect an external power supply to #25. Decrease the voltage from 5 V. When full blanking is applied to #13, measure the voltage.		
G22	E / W Output Self-Diagnosis	A	Connect a 5-V external power supply to #23. Read D ₂ in bus read mode. (V _{BUS EWOFF}) When the external power supply connected to #23 is disconnected, read D ₂ in bus read mode. Ensure that an E / W waveform is output from #22. (V _{BUS EWON})		
G23	V-Out Output Self-Diagnosis	A	Connect a 9-V external power supply to #24. Read D ₃ in bus read mode. (V _{BUS VOFF}) When the external power supply connected to #24 is disconnected, read D ₃ in bus read mode. Ensure that a V-out waveform is output from #25. (V _{BUS VON})		
G24	Vertical Blanking Check	A	1) Set the subaddress (0C) data to (81). When the subaddress (11) D ₄ ~D ₀ are changed from 0000 to 1111, check that the #13 blanking stop phase begins. (V _{BLK1}) 2) When the subaddress (12) D ₄ ~D ₀ are changed from 0000 to 1111, check that the #13 blanking start phase begins. (V _{BLK2})		
G25	V Centering DAC Output	A	1) Set the subaddress (13) data to (00) and measure the #21 voltage V _{21L} . 2) Set the subaddress (13) data to (80) and measure the #21 voltage V _{21M} . 3) Set the subaddress (13) data to (FE) and measure the #21 voltage V _{21H} .		
G26	V NFB Pin Input Current	A	Connect a 9-V V _{CC} via a 100-kΩ resistor to #25. Measure the sink current on #25 according to the voltage difference of the 100-kΩ resistance. $I_{25} = V / 100 \text{ k}\Omega$

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
- The products described in this document are subject to the foreign exchange and foreign trade laws.
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA CORPORATION for any infringements of intellectual property or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any intellectual property or other rights of TOSHIBA CORPORATION or others.
- The information contained herein is subject to change without notice.
