

# TB2912HQ

## Maximum Power 41 W BTL × 4-ch Audio Power IC

The TB2912HQ is 4ch audio amplifier for car audio application. This IC can generate high power, high quality sound output,  $P_{OUT\ MAX} = 41\ W$ , using a pure complementary P-ch and N-ch DMOS output stage.

The built-in self diagnosis function which is included can be controlled via I<sup>2</sup>C BUS.

In addition, stand-by and mute function, and various Protection feature are included.

Weight: 7.7 g (typ.)

### Features

- High power output
  - :  $P_{OUT\ MAX} (1) = 41\ W$  (typ.)  
( $V_{CC} = 14.4\ V$ ,  $f = 1\ kHz$ , JEITA max,  $R_L = 4\ \Omega$ )
  - :  $P_{OUT\ MAX} (2) = 37\ W$  (typ.)  
( $V_{CC} = 13.7\ V$ ,  $f = 1\ kHz$ , JEITA max,  $R_L = 4\ \Omega$ )
  - :  $P_{OUT\ MAX} (3) = 70\ W$  (typ.)  
( $V_{CC} = 14.4\ V$ ,  $f = 1\ kHz$ , JEITA max,  $R_L = 2\ \Omega$ )
  - :  $P_{OUT} (1) = 27\ W$  (typ.)  
( $V_{CC} = 14.4\ V$ ,  $f = 1\ kHz$ , THD = 10%,  $R_L = 4\ \Omega$ )
  - :  $P_{OUT} (2) = 23\ W$  (typ.)  
( $V_{CC} = 13.2\ V$ ,  $f = 1\ kHz$ , THD = 10%,  $R_L = 4\ \Omega$ )
  - :  $P_{OUT} (3) = 46\ W$  (typ.)  
( $V_{CC} = 14.4\ V$ ,  $f = 1\ kHz$ , THD = 10%,  $R_L = 2\ \Omega$ )
- Low distortion ratio: THD = 0.015% (typ.)  
( $V_{CC} = 13.2\ V$ ,  $f = 1\ kHz$ ,  $P_{OUT} = 5\ W$ ,  $R_L = 4\ \Omega$ )
- Low noise:  $V_{NO} = 90\ \mu V_{rms}$  (typ.)  
( $V_{CC} = 13.2\ V$ ,  $R_g = 0\ \Omega$ ,  $BW = 20\ Hz$  to  $20\ kHz$ ,  $R_L = 4\ \Omega$ )
- Built in stand by & muting function: controlled via I<sup>2</sup>C Bus (pin 16)
- Built in clipping detection (pin 4)
- Built in I<sup>2</sup>C Bus for stand-by, mute, voltage gain control, self diagnosis: Output short detection, offset detection, tweeter or speaker open detection (pin 22 and 25)
- Built-in various protection circuits (Note 1, Note 2)  
Thermal shut down, over-voltage, out to GND, out to VCC, out to out short circuit
- Operating supply voltage:  $V_{CC\ (opr)} = 9$  to  $18\ V$  ( $R_L = 4\ \Omega$ )  
 $V_{CC\ (opr)} = 9$  to  $16\ V$  ( $R_L = 2\ \Omega$ )

Note 1: Install the product correctly. Otherwise, it may result in break down, damage and/or degradation to the product or equipment.

Note 2: These protection functions are intended to avoid some output short circuits or other abnormal conditions temporarily. These protect functions do not warrant to prevent the IC from being damaged.

- In case of the product would be operated with exceeded guaranteed operating ranges, these protection features may not operate and some output short circuits may result in the IC being damaged.

**Block Diagram**

Some of the functional blocks, circuits, or constants labels in the block diagram may have been omitted or simplified for clarity.

**Caution and Application Information (description is made referring only on the single channel.)**

**1. Voltage Gain Adjustment**

This IC has no NF (negative feedback) Pins. Therefore, the voltage gain can not be adjusted (except by software). However, this feature makes possible space and cost saving.

**Figure 1 Block Diagram**

The amplifier gain,  $G_V = 26\text{dB}$ , is calculated using the expression below:

The voltage gain of amp.1:  $G_{V1} = 0\text{dB}$

The voltage gain of amp.2A, B:  $G_{V2} = 20\text{dB}$

The voltage gain of BTL connection:  $G_V(\text{BTL}) = 6\text{dB}$

Therefore, the total voltage gain is decided by expression below.

$$G_V = G_{V1} + G_{V2} + G_V(\text{BTL}) = 0 + 20 + 6 = 26\text{dB}$$

In the case when  $G_V = 12\text{dB}$  selected via I<sup>2</sup>C,  $G_{V1}$  changed from  $0\text{dB}$  to  $-14\text{dB}$  so that the output dynamic range is reduced as the output of Amp.1 is attenuated.

**2. Stand by and muting (pin 16)**

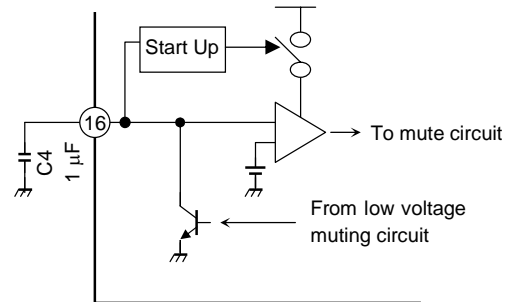

The below procedure can make the pop noise suppress.

At turning on(Stand by off)

- ① I<sup>2</sup>C bus circuit awake as the pin 16 is 2.5V and more.  
The voltage of pin 16 is pulled up to  $V_{CC}$  after this.  
Therefore, the diode insertion is necessary between pin 16 and micro controller to stop the reverse current if the micro controller control the pin 16 of this IC.
- ② Control the mute / standby function via I<sup>2</sup>C as I<sup>2</sup>C command can be received after ① condition.

To turning off (Standby on)

- ① Control muting circuit to mute ON via I<sup>2</sup>C control or the pin 16 is set at M position
- ② Control the standby circuit to turn off via I<sup>2</sup>C bus and it become in standby mode after  $53200 \times C_2(\text{sec})$  later from sending the standby ON command.
- ③ The pop noise generates if the pin 16 is set at L position in advance to the ②step, or from the ① step to the ③ step directly.

**Figure 2 Stand by and Mute**

The capacitor  $C_4$  at pin 16 is for muting time constant to suppress the pop noise. The larger value capacitor is used, the lower pop noise becomes but the longer the muting time from the mute ON command sent to muting an output sound actually.

The charge period, which makes the delay of muting after "Mute On" command is written, is  $\text{MIN}=30\text{msec}$ ,  $\text{MAX}=180\text{msec}$  in case of  $C_4(\text{Pin } 16) = 1 \text{ uF}$ ,  $V_{CC}=9 \text{ to } 18\text{V}$  and  $T_j = 40 \text{ to } 150 \text{ degrees}$  condition..

As the  $V_{CC}$  is rapidly falling, the IC internal low voltage muting operates to eliminate the large pop noise basically.

Use the transistor which has the current capacitance more than  $1\text{mA}$  to control the pin 16 in stable.

**3. Clip Detection**

The output clip detection terminal, pin 4, has an open collector output structure on chip as shown in Figure 3. In the case when the output waveform is clipping, the clip detection circuit is operated and the NPN Tr. is turned on.

It is possible to improve the audio output quality by controlling the volume and/or tone control circuits through a low pass filter (L.P.F) smoothing circuit as shown in Figure 3.

The sensitivity of the circuit to clipping level can be selected T.H.D. = 1% or 10% via I<sup>2</sup>C bus.

In the event that this function is not used, pin4 should be left open circuit.

**Figure 3 Clip Detection**

**4. External Component Values**

Component Name	Recommended Value	Purpose	Effect		Notes
			Lower than Recommended Value	Higher than Recommended Value	
C1	0.22 $\mu$ F	To eliminate DC	Cut-off frequency becomes higher	Cut-off frequency becomes lower	Pop noise is concerned with this capacitor.
C2	10 $\mu$ F	To reduce ripple To determine the time of turn on diag	Power ON/OFF time and turn ON diag cycle shorter	Power ON/OFF time and turn ON diag cycle longer	
C3	0.1 $\mu$ F	To provide sufficient oscillation margin	Reduces noise and provides sufficient oscillation margin		
C4	1 $\mu$ F	To reduce pop noise	Pop noise becomes larger Muting ON/OFF time is shorter	Pop noise becomes smaller Muting ON/OFF time is longer	
C5	3900 $\mu$ F	Ripple filter	Power supply ripple filtering		

Note 3: In case of the recommended value not used.

**5. Fast Mute Mode**

This feature will normally be used to suppress pop noise resulting from VCC transients during engine cranking condition.

The fast mute mode can be entered on receipt of a command via I<sup>2</sup>C bus.

Using the IB2 register and setting to 'one' the bit D6, it is possible to generate a fast I<sup>2</sup>C mute command.

If a fast mute command is received, this IC will operate and will discharge the capacitor C4 at pin16.

Therefore the Pop sound will be reduced compared to the condition when Fast Mute is not used in the engine cranking condition.

## 6. Explanation for Self Diagnosis Via I<sup>2</sup>C

(1) Bus map

### 【Slave Address】

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Details	Hex
							0	Write Mode	
							1	Read Mode	
1	1	0	1	1	0	0	—		D8H

### 【WRITE】

• Sub address

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Details	Hex
0								Page Mode (auto increment) OFF	
1								Page Mode (auto increment) ON	
—	0	0	0	0	0	0	1	Control Byte1	01H
—	0	0	0	0	0	1	0	Control Byte2	02H

• Control byte1 (01H) : Initial statement = All “0”

Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Function
0	0	0	0	0	0	0	1	Clip Det 1% to 10% change
0	0	0	0	0	0	1	0	R-ch Muting off (play)
0	0	0	0	0	1	0	0	Fch Muting off (play)
0	0	0	0	1	0	0	0	R-ch Gain 26dB to 12dB
0	0	0	1	0	0	0	0	Fch Gain 26dB to 12dB

—	—	—	—	—	—	—	—	x
—	—	—	—	—	—	—	—	x

Note 6: Short circuit protection can be operated channel by channel.

EX) If channel 1 output is shorted, channel 1 is protected but other channels are available.

Caution: sub address 0x15 (15H) is for our internal testing only. Do not apply for your using.

(2) Description for turn on diagnosis

This IC can determine whether the conditions listed below occur or not at turn ON:

- Short to GND
- Short to VCC
- Output to output short
- Speaker open

As first “switch on”, the write data is sent to “turn ON” the IC.

If the turn on diagnostic is activated at this time, the write data, with the diagnostic cycle byte: IB1 D6 set at 1, is sent at the same time

The result of self diagnosis can be obtained from the read data sent after the turn on diagnostic data permitted time, as below Figure:

**Figure 4 Diagnosis Timing Chart**

**Figure 5 Number of Times Turn ON Diagnosis Timing Chart**

As initially, the write data is set when the on diagnostic cycle enable (IB1 D6 = 1), the turn on diagnosis can be available for repeated use by sending the read command repeatedly after the initial set up as shown as Figure 5.

Therefore, it is useful to check number of cycles from Power ON to the output appearance.

This IC has two built-in diagnostic modes dependent on the Turn-on timing.

- A) Normal mode (one shot) of Turn-on diagnostics (data of IB1, D7 =0)
- B) Repeatability mode of Turn-on diagnostics (data of IB1, D7 = 1)

A) Normal mode (one shot diag.)

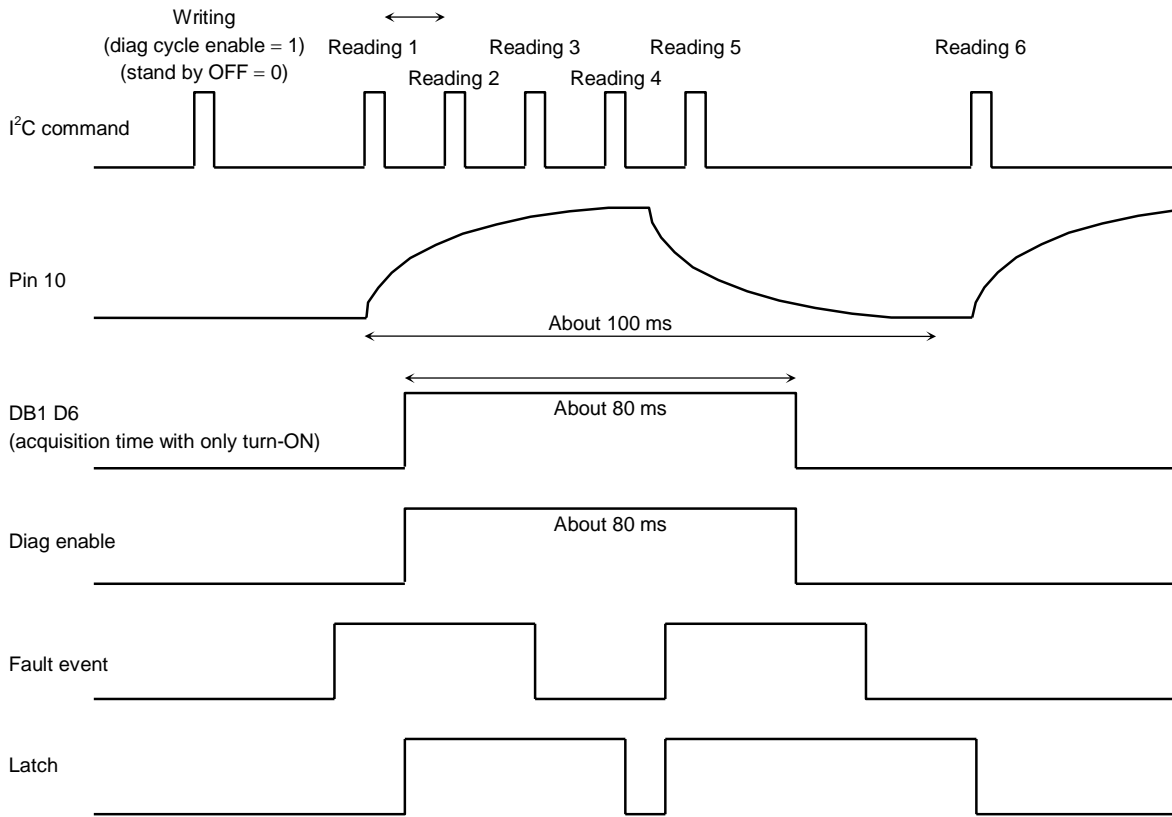

For example, if you want to get two valid readings, you have to send the command to read three times.

True data are second data and third data.

B) Repetition mode

Maximum interval:  
You can select the acquisition time.  
Minimum interval:  
It is determined by the speed of microcomputer.

The turn ON diagnostic acquisition time is determined by the ripple filter capacitance C2 and the equivalent internal resistance Rr as below expression.

$$\text{Acquisition time} = 2 \times C2 \times Rr = 4400 \times C2 \text{ (typ.)}$$

Rr is fixed in internal circuit and it is not varied by the fluctuation of power supply VCC voltage.

C2 value determines the time from power ON (standby off) to the appearance of sound signal from output and the characteristic for ripple rejection ratio, too. So, take care with the decision on C2 value.

If the turn ON diagnosis is not used, in other words the diagnostic cycle defeat command is sent, the waveform of ripple terminal voltage will change but the time from turning on to the output signal appearance will not change as illustrated below in Figure 6.

Figure 6 Turn on Diagnosis Timing Chart when Turn on diagnosis not used.

(3) Description for permanent diagnosis

This IC can provide permanent diagnosis under the following conditions, whether they occur before or after turning ON:

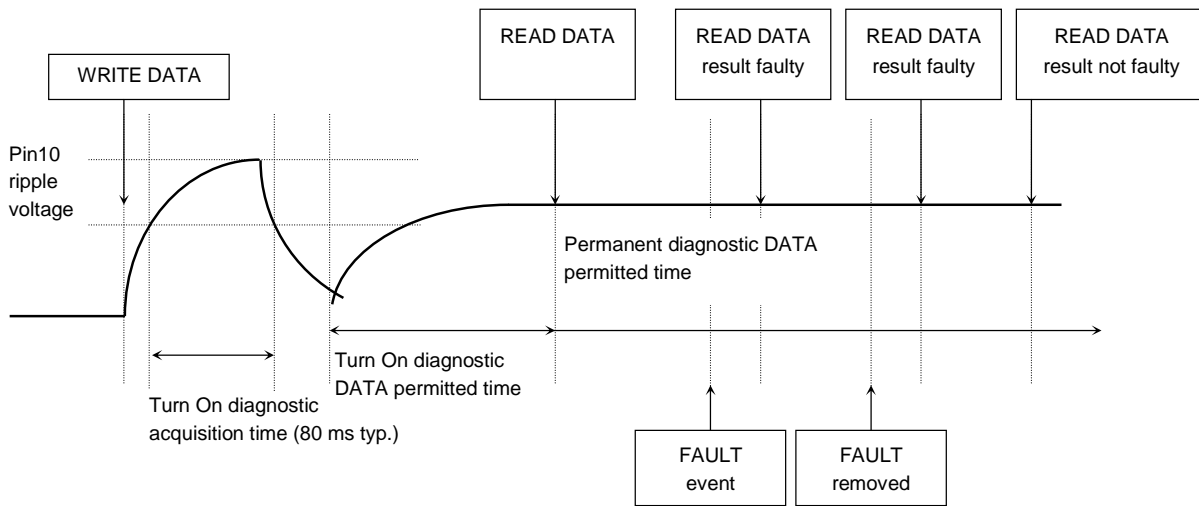

- Short to GND
- Short to VCC
- Output to output short circuit
- Output offset detection
- Current detection for tweeter open

This permanent diagnosis is available not only with the diagnostic cycle byte: IB1 D6 set at 1 but also when set at 0.

Additionally, the signal can be obtained by entering just a read command. It is not necessary to write the data.

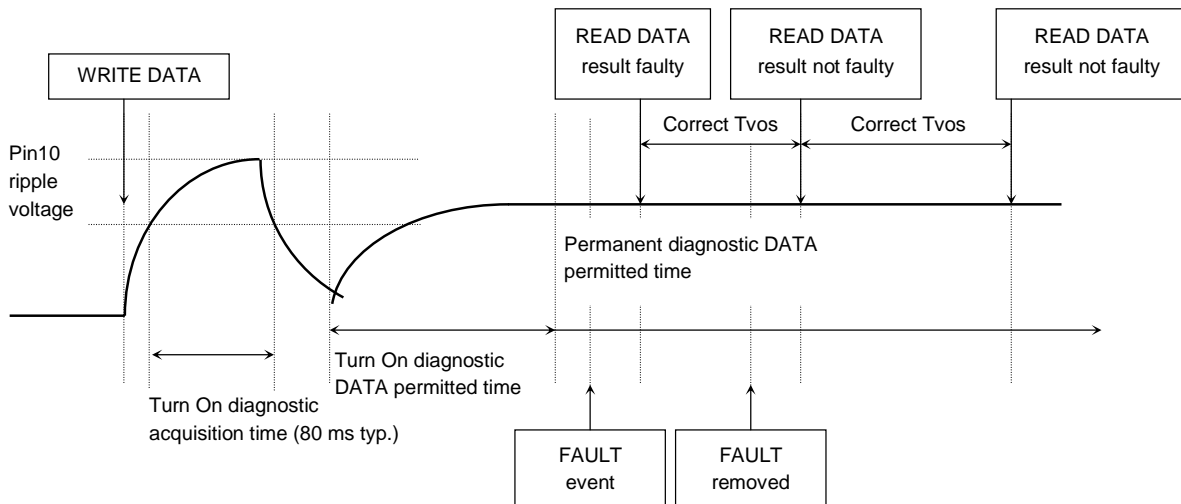

With permanent diagnosis fault detection, the first read data after fault removal will still show a Fault. Therefore, it is necessary to obtain 3 or more readings in order to prevent a miss judgment. For example, the speaker sometimes makes a large counter electro motive force which this IC could recognize as a fault event.

Additionally, this permanent diagnosis is automatically on after the turning on diagnosis operation finished therefore there is no need to send the extra command.

**Figure 7 Permanent Diagnosis Timing Chart for Each Short Detection**

Regarding operation of the output offset detection, The software always detects the output offset but the result is not latched internally as shown in the Figure below:

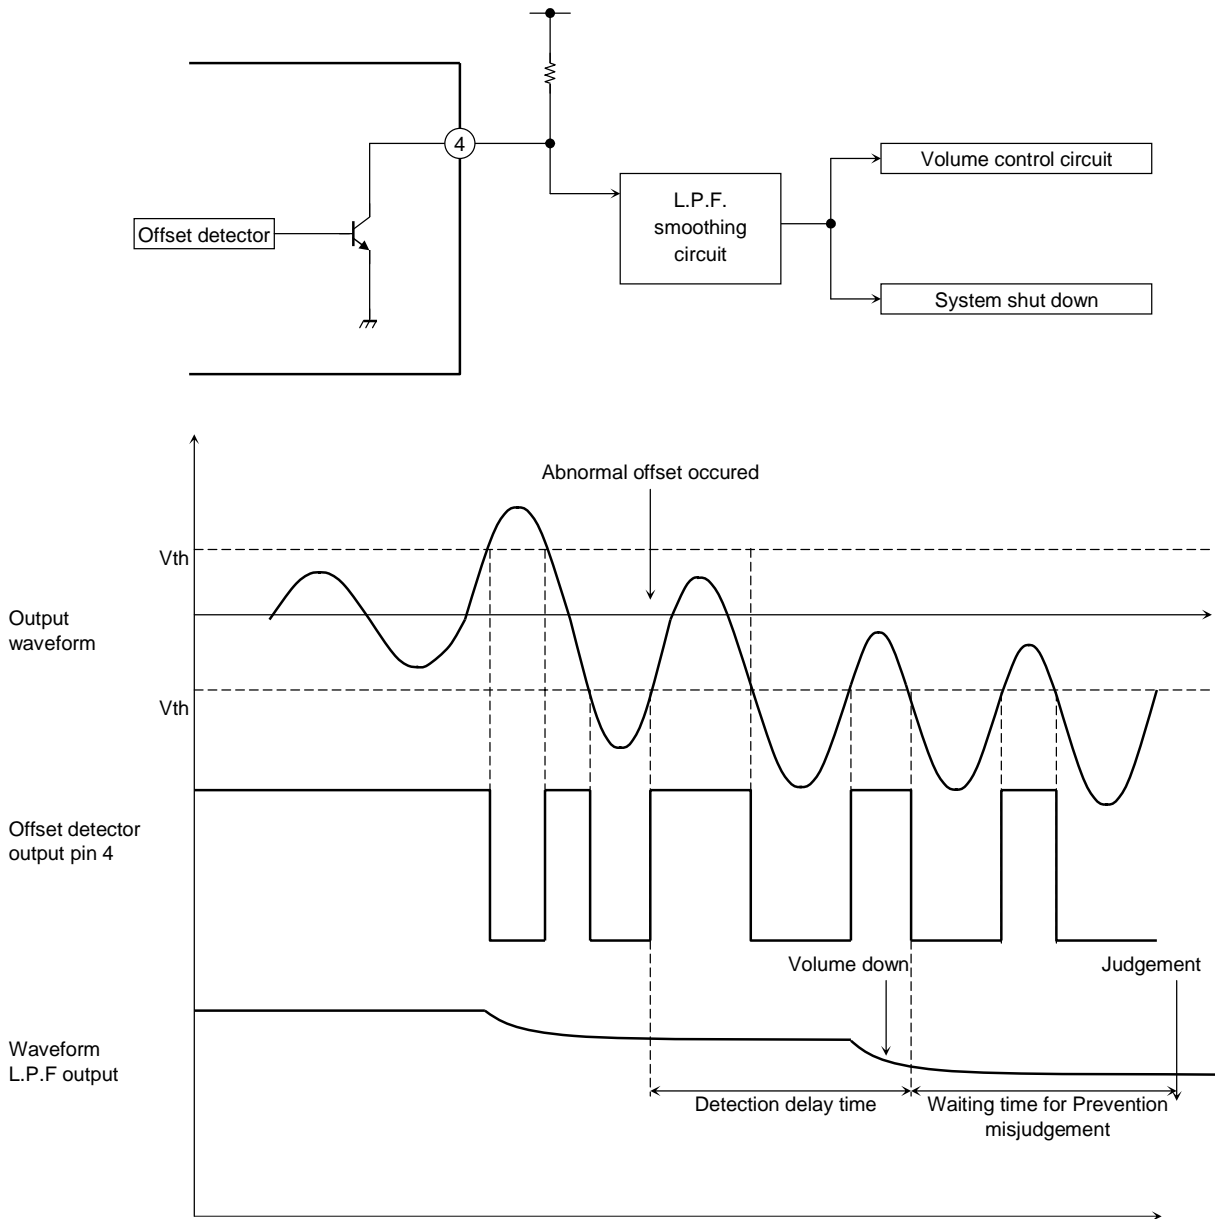

**Figure 8 Software Output Offset Detection Timing Chart**

However, this detection has to be performed in real time: Time voltage offset (Tvos) between read and next read is set at  $Tvos = 1/\text{the lowest signal frequency}$ , or more. For instance  $Tvos > 50 \text{ ms}$  if the lowest output signal frequency is 20 Hz, and to obtain 2 or more readings in order not to make a misjudgment

Additionally, the threshold level is designed at  $\pm 2 \text{ V}$ .

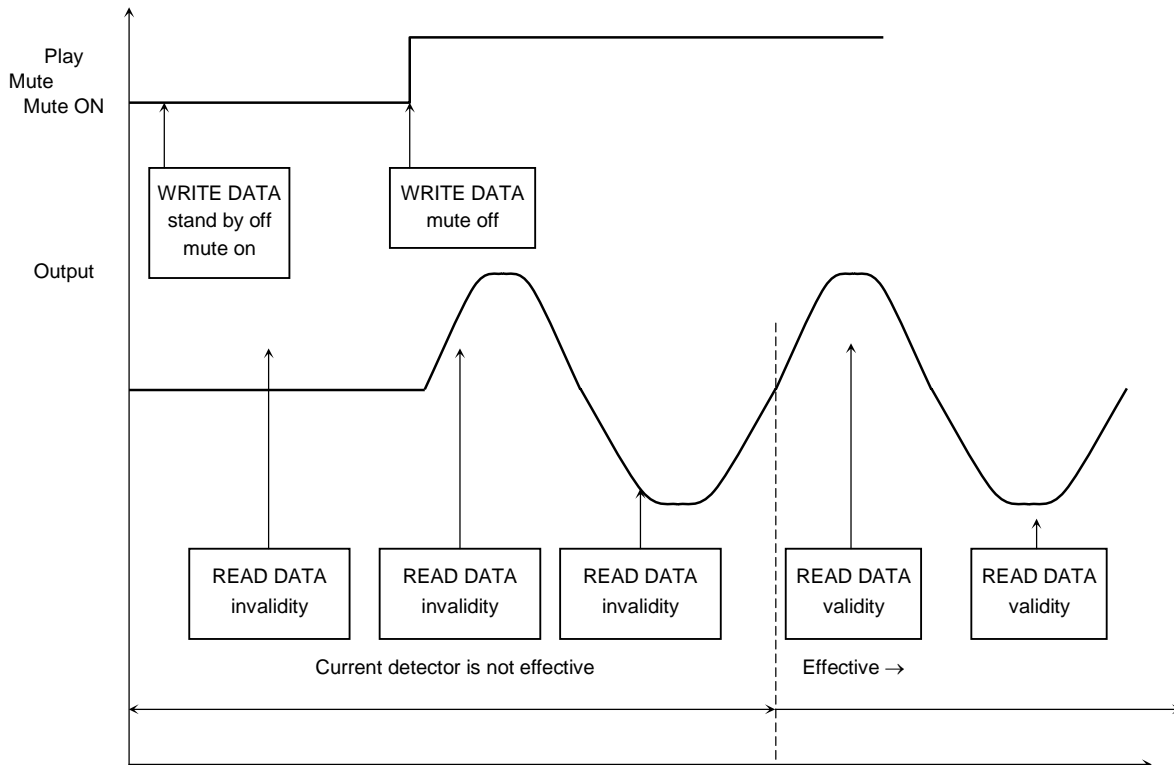

The output from the terminal of pin 4 can be changed from clip detector to offset detector output by sending the write command via I<sup>2</sup>C.

If the L.P.F output voltage has become a half of pull up voltage for a while, firstly the signal output volume goes down (clipping detector function). After that, it can be judged that the abnormal output offset has occurred, if the L.P.F. output voltage does not rise above half of pull up voltage.

**Figure 9 Hardware Output Offset Detection**

- When the current detector for Tweeter open check is used, it is necessary to take care as below:
- Need to input the pulse or signal which is the higher out of audience frequency for example  $f = 20\text{ kHz}$
  - The pulse or signal input timing has to be after mute off (play mode)
  - At least, the read timing has to be after 1 cycle of input pulse or signal and more, the recommendation cycles are 3 cycle and more if can.
  - The level of input pulse or signal is more than the detection threshold level 300 mA or 500 mA.
- For instance, if the tweeter impedance is  $20\ \Omega$  at  $f = 20\text{ kHz}$  which is same as input signal frequency, the output minimum voltage is:  $V_{out} = 500\text{ mA} \times 20\ \Omega = 10\text{ V}$  and more.

**Figure 10 Tweeter Open Detection Timing Chart**

Finally, if DB1 D7 = 1 then the temperature of IC chip is close to the thermal shutdown point. This warning bit becomes high, about 10 degrees below the temperature at which the overtemperature protection operates.

Note 7: Timing charts may have been simplified for ease of reading.

Note 8: Please arrange to read all self-diagnosis functions twice or more and apply judgment in order to avoid false triggering.  
 <Since the first diagnostic result has low confidence, please diagnose 2 times or more.>

(4) Multiple faults

The self diagnosis shows as below tables when there are multi fault connection for the audio outputs.

**At Turning ON:**

	S.GND (out+)	S.GND (out-)	S.V <sub>CC</sub>	Out to Out. S	Open L
S.GND (out+)	S.GND	S.GND	S.Load	S.GND	S.GND + No open
S.GND (out-)		S.GND	S.Load	S.GND	S.GND + No open
S.V <sub>CC</sub>			S.V <sub>CC</sub> + S.Load	S.V <sub>CC</sub> + S.Load	S.V <sub>CC</sub> + S.Load + open or No open
Out to Out.S				S.Load	S.Load + No open
Open L					Open

**At Permanent:**

	S.GND (out+)	S.GND (out-)	S.V <sub>CC</sub>	Out to Out. S	Open L
S.GND (out+)	S.GND	S.GND	S.GND or S.V <sub>CC</sub> (Note 10)	S.GND	S.GND (Note 9)
S.GND (out-)		S.GND	S.GND or S.V <sub>CC</sub> (Note 10)	S.GND	S.GND (Note 9)
S.V <sub>CC</sub>			S.V <sub>CC</sub>	S.V <sub>CC</sub>	S.V <sub>CC</sub> (Note 9)
Out to Out.S				S.Load + S.GND	N/A
Open L					Normal

Note 9: If the DC offset detection mode is ON, the information which the DC offset is appeared is added.

Note10: The chance which they can read this exact information is only one time although in case of other diagnosis, the more times sending read command, the higher the confidence of the result.

For example,

- a) ch1+ is connected to GND
- b) ch1- is connected to V<sub>CC</sub>
- c) They can read or get the “Short to GND” information when the uP send the Read command.
- d) Next, however, they can not get the “Short to GND” or “Short to V<sub>CC</sub>” information when the uP send the Read command again.

Note 11: Please arrange to read all self-diagnosis functions twice or more and apply judgment in order to avoid false triggering.

(5) Explanation of I<sup>2</sup>C bus commands

Below the “ADDRESS BYTE”, presently the address byte is fixed at 216 dec = D8hex = 101100xbin.

**- Address Selection is D8hexa:**

A7	Address bit	1
A6	Address bit	1
A5	Address bit	0
A4	Address bit	1
A3	Address bit	1
A2	Address bit	0
A1	Address bit	0
A0 (R/W)	Read/Write bit	X

X: 0 = Write instruction to device; 1 = Read instruction to device

- If R/W = 0, the Up Sends Two Instruction Bytes, IB1 and IB2:

**IB1 Instruction Byte:**

Bit	
D7	Turn-on diag timing Normal (D7 = 0) Repeat (D7 = 1)
D6	Diagnostic cycle enable (D6 = 1) Diagnostic cycle defeat (D6 = 0)
D5	Offset Detection enable (D5 = 1) Offset Detection defeat (D5 = 0)
D4	Front Channel Gain = 26dB (D4 = 0) Gain = 12dB (D4 = 1)
D3	Rear Channel Gain = 26dB (D3 = 0) Gain = 12dB (D3 = 1)
D2	Mute front channels (D2 = 0) Unmute front channels (D2 = 1)
D1	Mute rear channels (D1 = 0) Unmute rear channels (D1 = 1)
D0	CD 1% (D0 = 0) CD 10% (D0 = 1)

**IB2 Instruction Byte:**

Bit	
D7	Current Det 500 mA (max) (D7 = 0) Current Det 300 mA (max) (D7 = 1)
D6	Fast mute on (D6 = 1) off (D6 = 0)
D5	Pin4 Clip Detection (D5 = 0) Pin4 Offset Detection (D5 = 1)
D4	Std-by on-PA not working (D4 = 0) Std-by off-PA working (D4 = 1)
D3	Amplifier mode diagnostic (D3 = 0) Line driver mode diagnostic (D3 = 1)
D2	Current Det. diag enabled (D2 = 1) Current Det. diag defeat (D2 = 0)
D1	Front Channels Work standard mode (D1 = 0) Work Low lccq mode (D1 = 1)
D0	Rear Channels Work standard mode (D1 = 0) Work Low lccq mode (D1 = 1)

- If R/W = 1, the Power Amplifier Sends Four Diagnostics Bytes, DB1, DB2, DB3 and DB4:

**DB1 Diagnostic Byte:**

Bit	
D7	Thermal warning active (D7 = 1)
D6	Diag not activated or not terminated (D6 = 0) Diag terminated (D6 = 1)
D5	Channel 1 current detection Output peak current < 250 mA (IB2 – D7 = 0) – open load (D5 = 1) Output peak current < 100 mA (IB2 – D7 = 1) – open load (D5 = 1) Output peak current > 500 mA (IB2 – D7 = 0) – normal load (D5 = 0) Output peak current > 300 mA (IB2 – D7 = 1) – normal load (D5 = 0)
D4	Channel 1 Turn-on diagnostic (D4 = 0) Permanent diagnostic (D4 = 1)
D3	Channel 1 Normal load (D3 = 0) Short load (D3 = 1)
D2	Channel 1 Turn-on diag: No open load (D2 = 0)                      Open load detected (D2 = 1) Offset diag: No output offset (D2 = 0)                      Output offset detected (D2 = 1)
D1	Channel 1 No short to V <sub>CC</sub> (D1 = 0) Short to V <sub>CC</sub> (D1 = 1)
D0	Channel 1 No short to GND (D0 = 0) Short to GND (D0 = 1)

**DB2 Diagnostic Byte:**

Bit	
D7	Offset detection not activated (D7 = 0) Offset detection activated (D7 = 1)
D6	Current sensor not activated (D6 = 0) Current sensor activated (D6 = 1)
D5	Channel 2 current detection Output peak current < 250 mA (IB2 – D7 = 0) – open load (D5 = 1) Output peak current < 100 mA (IB2 – D7 = 1) – open load (D5 = 1) Output peak current > 500 mA (IB2 – D7 = 0) – normal load (D5 = 0) Output peak current > 300 mA (IB2 – D7 = 1) – normal load (D5 = 0)
D4	Channel 2 Turn-on diagnostic (D4 = 0) Permanent diagnostic (D4 = 1)

D2	Channel 4 Turn-on diag: No open load (D2 = 0)                      Open load detected (D2 = 1) Offset diag: No output offset (D2 = 0)                      Output offset detected (D2 = 1)
D1	Channel 4 No short to V <sub>CC</sub> (D1 = 0) Short to V <sub>CC</sub> (D1 = 1)
D0	Channel 4 No short to GND (D0 = 0) Short to GND (D0 = 1)

Note 13: DBx (D5) is effective only at the time of “Current detection enable”.

7. Caution for use

Turn on diagnosis mode

The comparator detect the voltage between speaker both ends.  
 If that voltage is larger, this detector judges “output load open”, while, if it is smaller, this detector judges the “short load”.  
 But, in case of output shorted to VCC or shorted to GND condition, the voltage between speaker will be surely changed.  
 Therefore, this system can not present exact information, for example, "Short to VCC" and "Short load" are showed though output is shorted to Vcc but no short load.  
 In this case, the result as DET2 shall be dropped or ignored and DET1 is effective as DET1 is prior to DET2.

Permanent diagnosis mode

Please arrange to read all self-diagnosis functions twice or more and apply judgment in order to avoid false triggering. <Since the first diagnostic result has low confidence, please diagnose 2 times or more.>

Automatic turn on muting

The automatic turn on muting operates from when the turn on write command is sent, it is continued until the Pin 10 ripple pin voltage reaches to about the  $8\sqrt{F}=5.6V$ .

During this automatic turn on muting operation, output sound can not appear even if the mute off write command is sent because the internal muting circuit operates.

The automatic turn on muting operation period is MIN=xx msec, MAX=zz msec in case of C2 (Pin 10) = 10 uF, Vcc=9 to 18V and Tj = -40 to 150 degrees condition.

When the Turn on diagnosis is enable, the automatic muting period starts after Turn on diag cycle period.

This period is in proportion to the value of the C2 so that the characteristic of C2 shall be had a care, for example, temperature, variation and so on.

Figure 11 Automatic Turn on Muting Timing Chart

## Examples of Bytes Sequence

### 1 - Turn-On Diagnostic - Write Operation

Start	Address byte with D0 = 0	ACK	Sub-address D0 = 1	ACK	IB with D6 = 1	ACK	IB2	ACK	STOP
-------	--------------------------	-----	--------------------	-----	----------------	-----	-----	-----	------

Note 14: Auto increment

### 2 - Turn-On Diagnostic - Read Operation

Start	Address byte with D0 = 1	ACK	DB1	ACK	DB2	ACK	DB3	ACK	DB4	ACK	STOP
-------	--------------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	------

### 3a - Turn-On of the Power Amplifier with 26dB Gain, Mute On, Diagnostic Defeat.

Start	Address byte with D0 = 0	ACK	Sub-address D0 = 1	ACK	IB 1	ACK	IB2	ACK	STOP
					X0X0000X		XXX1X0XX		

Note 15: Auto increment

### 3b - Turn-Off of the Power Amplifier

Start	Address byte with D0 = 0	ACK	Sub-address D0 = 1	ACK	IB 1	ACK	IB2	ACK	STOP
					X0XXXXXX		XXX0XXXX		

Note 16: Auto increment

### 4 - Offset Detection Procedure Enable

Start	Address byte with D0 = 0	ACK	Sub-address D0 = 1	ACK	IB 1	ACK	IB2	ACK	STOP
					XX1XX11X		XXX1X0XX		

Note 17: Auto increment

### 5 - Offset detection procedure stop and reading operation (the results are valid only for the offset detection bits (D2 of the bytes DB1, DB2, DB3, DB4).

Start	Address byte with D0 = 1	ACK	DB1	ACK	DB2	ACK	DB3	ACK	DB4	ACK	STOP
-------	--------------------------	-----	-----	-----	-----	-----	-----	-----	-----	-----	------

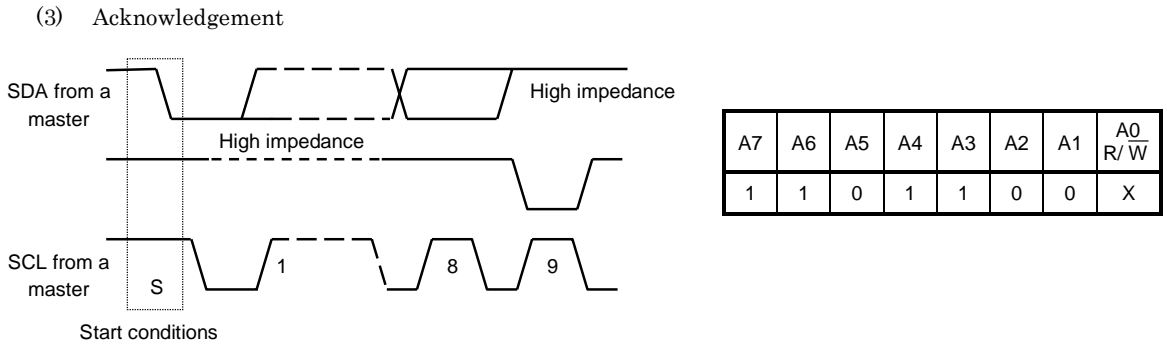

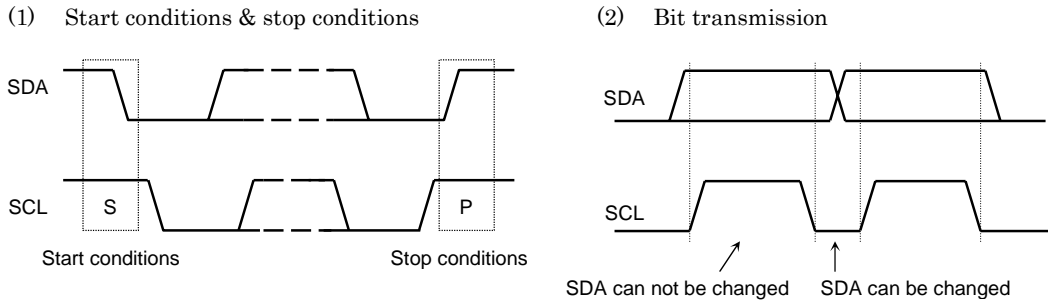

## I<sup>2</sup>C Bus control format outline

The BUS control format of TB2912HQ is based on the Philips I<sup>2</sup>C bus control format.

## Data Transmission Format

Note 18: It is transmitting, without forgetting, P conditions.

Purchase of TOSHIBA I<sup>2</sup>C components conveys a license under the Philips I<sup>2</sup>C Patent Rights to use these components in an I<sup>2</sup>C system, provided that the system conforms to the I<sup>2</sup>C Standard Specification as defined by Philips.

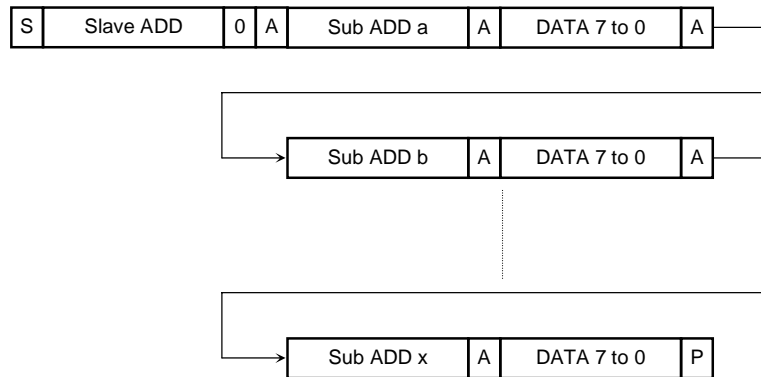

## TB2912HQ I<sup>2</sup>C Bus Transmission Format

### (1) Write mode

In addition to usual transmission, it corresponds to continuation transmission and the auto increment mode as a transmission format. After a transmission end, in case data transmission is newly, it is necessary to open the term beyond 1 clock.

#### 1) Continuation transmission

(An address to change is specified. At this time, MSB of a sub-address is set as 0.)

#### 2) Auto increment

(Sub address are set to increment from N one by one. MSB of a sub-address is set as 1.)

### (2) Read mode

The slave address became the read mode by changing the 8 Bit of the slave address from 0 to 1.

The data output from TB2912HQ starts after the micro controller receives the ACK 1 bit which follows a slave address.

Stop condition are shown in the under the map.

The micro controller shall send the stop condition P after it sent the reversed Acknowledge (high) in case of the read mode finished.

The data transmission became not available condition if the micro controller intended to send the stop condition P expect for this procedure because this IC occupies the data bus until the micro controller send the start conditions again.

..... send a DATA from microcontroller.

..... send a DATA from TB2912HQ.

**Absolute Maximum Ratings (Ta = 25°C)**

Characteristics	Symbol	Rating	Unit
Peak supply voltage (0.2 s)	V <sub>CC</sub> (surge)	50	V
DC supply voltage	V <sub>CC</sub> (DC)	28	V
Operation supply voltage	V <sub>CC</sub> (opr)	18	V
Output current (peak)	I <sub>O</sub> (peak)	9	A
Power dissipation	P <sub>D</sub> (Note 19)	125	W
Operation temperature	T <sub>opr</sub>	-40 to 85	°C
Storage temperature	T <sub>stg</sub>	-55 to 150	°C

Note 19: Package thermal resistance  $\theta_j\text{-T} = 1^\circ\text{C/W}$  (typ.) (Ta = 25°C, with infinite heat sink)

The absolute maximum ratings of a semiconductor device are a set of specified parameter values, which must not be exceeded during operation, even for an instant. If any of these rating would be exceeded during operation, the device electrical characteristics may be irreparably altered and the reliability and lifetime of the device can no longer be guaranteed. Moreover, these operations with exceeded ratings may cause break down, damage and/or degradation to any other equipment. Applications using the device should be designed such that each absolute maximum rating will never be exceeded in any operating conditions. Before using, creating and/or producing designs, refer to and comply with the precautions and conditions set forth in this documents.

## Electrical Characteristics

(unless otherwise specified,  $V_{CC} = 13.2\text{ V}$ ,  $f = 1\text{ kHz}$ ,  $R_L = 4\ \Omega$ ,  $T_a = 25^\circ\text{C}$ )

Characteristics	Symbol	Test Circuit	Test Condition	Min	Typ.	Max	Unit

	$P_{OUT(2)}$	—	THD = 10%	—	23	—	
Output power ( $R_L = 2\ \Omega$ )	$P_{OUT\ MAX(3)}$	—	$V_{CC} = 14.4\text{ V}$ , max POWER	—	70	—	W
	$P_{OUT\ MAX(4)}$	—	$V_{CC} = 13.7\text{ V}$ , max POWER	—	64	—	
	$P_{OUT(3)}$	—	$V_{CC} = 14.4\text{ V}$ , THD = 10%	42	46	—	
	$P_{OUT(4)}$	—	THD = 10%	—	39	—	
Total harmonic distortion	THD (1)	—	$P_{OUT} = 5\text{ W}$	—	0.015	0.1	%
	THD (2)	—	$V_o = 2\text{ Vrms}$ , $G_V = 12\text{ dB}$	—	0.01	0.1	
Voltage gain	$G_V(1)$	—	$V_{OUT} = 0.775\text{ Vrms}$	25	26	27	dB
	$G_V(2)$	—	$V_{OUT} = 0.775\text{ Vrms}$ , $G_V = 12\text{ dB}$	11	12	13	
Voltage gain ratio	$\Delta G_V$	—	$V_{OUT} = 0.775\text{ Vrms}$	-1	0	1	dB
Output noise voltage	$V_{no(1)}$	—	$R_g = 0\ \Omega$ , DIN45405	—	100	—	$\mu\text{Vrms}$
	$V_{no(2)}$	—	$R_g = 0\ \Omega$ , BW = 20 Hz to 20 kHz	—	90	200	
	$V_{no(3)}$	—	$R_g = 0\ \Omega$ , BW = 20 Hz to 20 kHz $G_V = 12\text{ dB}$	—	30	50	
Ripple rejection ratio	R.R.	—	fripple = 100 Hz, $R_g = 620\ \Omega$ $V_{rip} = 0.775\text{ Vrms}$	40	50	—	dB
Cross talk	C.T.	—	$R_g = 620\ \Omega$ $V_{OUT} = 0.775\text{ Vrms}$	—	65	—	dB
Output offset voltage	$V_{OFFSET}$	—	—	-150	0	150	mV
Input resistance	RIN	—	—	—	90	—	k $\Omega$
Standby current	ISB	—	Stand-by condition (Pin16 at 0V)	—	1	10	$\mu\text{A}$
Stand by & mute control voltage	VSM H	—	For operation, mute enable	7.0	—	$V_{CC}$	V
	VSM L	—	For mute, stand by OFF	0	—	5.0	
Mute attenuation	ATT M	—	Mute: ON $V_{OUT} = 7.75\text{ Vrms} \rightarrow$ Mute: OFF	80	90	—	dB
Clip det THD level	CD (1)	—	Low (01H D = 0)	—	1	2.5	%
	CD (2)	—	High (01H D = 1)	5	10	15	

Note 20: ISB specification will be decided to after final evaluation on tolerance spls.

## Diagnosis/Bus Specification

Characteristics	Test Condition	Min	Typ.	Max	Unit
Turn on diagnosis (power amplifier mode)					
Short to GND det.	Under stand-by condition	—	—	1.2	V
Short to V <sub>CC</sub> det.		V <sub>CC</sub> - 1.2	—	—	V
Shorted load		—	—	0.5	Ω
Open load		85	—	—	Ω
Normal load		1.5	—	45	Ω
Turn on diagnosis (line driver mode)					
Short to GND det.	Under stand-by condition	—	—	1.2	V
Short to V <sub>CC</sub> det.		V <sub>CC</sub> - 1.2	—	—	V
Shorted load		—	—	2	Ω
Open load		330	—	—	Ω
Normal load		6	—	180	Ω
Permanent diagnosis (power amplifier and line driver mode)					
Short to GND det.	Power amplifier in mute or play	—	—	1.2	V
Short to V <sub>CC</sub> det.		V <sub>CC</sub> - 1.2	—	—	V
Shorted load	Power amp mode only	—	0.5	—	Ω
Offset detection	Power amplifier in play (no signal)	—	+/-2	—	V
Current detector threshold 1		250		500	mA
Current detector threshold 2		100		300	mA
I <sup>2</sup> C bus interface					
Clock frequency		—	400	—	kHz

## Test Circuit

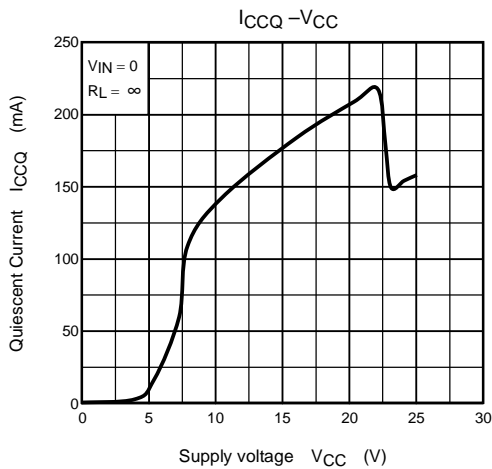

Components in the test circuits are only used to obtain and confirm the device characteristics. These components and circuits do not warrant to prevent the application equipment from malfunction or failure.

## Package Dimensions

HZIP25-P-1.00F

Unit: mm

※ From center to parting line.

Weight: 7.7 g (typ.)

- Use an appropriate power supply fuse to ensure that a large current does not continuously flow in case of over current and/or IC failure. The IC will fully break down when used under conditions that exceed its absolute maximum ratings, when the wiring is routed improperly or when an abnormal pulse noise occurs from the wiring or load, causing a large current to continuously flow and the breakdown can lead smoke or ignition. To minimize the effects of the flow of a large current in case of breakdown, appropriate settings, such as fuse capacity, fusing time and insertion circuit location, are required.
- If your design includes an inductive load such as a motor coil, incorporate a protection circuit into the design to prevent device malfunction or breakdown caused by the current resulting from the inrush current at power ON or the negative current resulting from the back electromotive force at power OFF. For details on how to connect a protection circuit such as a current limiting resistor or back electromotive force adsorption diode, refer to individual IC datasheets or the IC databook. IC breakdown may cause injury, smoke or ignition.
- Use a stable power supply with ICs with built-in protection functions. If the power supply is unstable, the protection function may not operate, causing IC breakdown. IC breakdown may cause injury, smoke or ignition.
- Carefully select external components (such as inputs and negative feedback capacitors) and load components (such as speakers), for example, power amp and regulator. If there is a large amount of leakage current such as input or negative feedback condenser, the IC output DC voltage will increase. If this output voltage is connected to a speaker with low input withstand voltage, overcurrent or IC failure can cause smoke or ignition. (The over current can cause smoke or ignition from the IC itself.) In particular, please pay attention when using a Bridge Tied Load (BTL) connection type IC that inputs output DC voltage to a speaker directly.
- **Over current Protection Circuit**  
Over current protection circuits (referred to as current limiter circuits) do not necessarily protect ICs under all circumstances. If the Over current protection circuits operate against the over current, clear the over current status immediately. Depending on the method of use and usage conditions, such as exceeding absolute maximum ratings can cause the over current protection circuit to not operate properly or IC breakdown before operation. In addition, depending on the method of use and usage conditions, if over current continues to flow for a long time after operation, the IC may generate heat resulting in breakdown.
- **Thermal Shutdown Circuit**  
Thermal shutdown circuits do not necessarily protect ICs under all circumstances. If the Thermal shutdown circuits operate against the over temperature, clear the heat generation status immediately. Depending on the method of use and usage conditions, such as exceeding absolute maximum ratings can cause the thermal shutdown circuit to not operate properly or IC breakdown before operation.
- **Heat Radiation Design**  
When using an IC with large current flow such as power amp, regulator or driver, please design the device so that heat is appropriately radiated, not to exceed the specified junction temperature (Tj) at any time and condition. These ICs generate heat even during normal use. An inadequate IC heat radiation design can lead to decrease in IC life, deterioration of IC characteristics or IC breakdown. In addition, please design the device taking into considerate the effect of IC heat radiation with peripheral components.
- **Installation to Heat Sink**  
Please install the power IC to the heat sink not to apply excessive mechanical stress to the IC. Excessive mechanical stress can lead to package cracks, resulting in a reduction in reliability or breakdown of internal IC chip. In addition, depending on the IC, the use of silicon rubber may be prohibited. Check whether the use of silicon rubber is prohibited for the IC you intend to use, or not. For details of power IC heat radiation design and heat sink installation, refer to individual technical datasheets or IC databooks.

## RESTRICTIONS ON PRODUCT USE

060116EBF

- The information contained herein is subject to change without notice. 021023\_D
- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.  
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc. 021023\_A
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk. 021023\_B
- The products described in this document shall not be used or embedded to any downstream products of which manufacture, use and/or sale are prohibited under any applicable laws and regulations. 060106\_Q
- The information contained herein is presented only as a guide for the applications of our products. No responsibility is assumed by TOSHIBA for any infringements of patents or other rights of the third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of TOSHIBA or others. 021023\_C
- The products described in this document are subject to the foreign exchange and foreign trade laws. 021023\_E
- This product generates heat during normal operation. However, substandard performance or malfunction may cause the product and its peripherals to reach abnormally high temperatures.  
The product is often the final stage (the external output stage) of a circuit. Substandard performance or malfunction of the destination device to which the circuit supplies output may cause damage to the circuit or to the product. 030619\_R

About solderability, following conditions were confirmed

- Solderability
  - (1) Use of Sn-37Pb solder Bath
    - solder bath temperature = 230°C
    - dipping time = 5 seconds
    - the number of times = once
    - use of R-type flux
  - (2) Use of Sn-3.0Ag-0.5Cu solder Bath
    - solder bath temperature = 245°C
    - dipping time = 5 seconds
    - the number of times = once
    - use of R-type flux
