

INTEGRATED AM/FM RADIO RECEIVER CIRCUIT

The TBA570A is for use in small low-cost a. m. portable receivers as well as in high quality battery or mains-fed a. m. and a. m./f. m. receivers.

The IC incorporates: a. m. mixer, oscillator, i. f. amplifier, a. g. c. amplifier, a. m. detector and capacitor, f. m./i. f. limiting amplifier and stable base bias for f. m. front-end, and an audio preamplifier and driver.

The unique integrated audio part has an internally limited bandwidth (18 kHz) and negligible h. f. radiation back to the ferrite rod. This makes the TBA570A ideally suitable for small size a. m. receivers because print layout is not critical. The driver stage can directly drive complementary output stages ($P_O = 6 \text{ W max.}$), or operate as a post amplifier ($V_O = 500 \text{ mV}$).

In its standard applications, the TBA570A can replace the TBA570.
