TC7MPH3245FTG

Low Voltage/Low Power 4-Bit × 2 Dual Supply Bus Transceiver with Bushold

The TC7MPH3245FTG is a dual supply, advanced high-speed CMOS 8-bit dual supply voltage interface bus transceiver fabricated with silicon gate CMOS technology.

Designed for use as an interface between a 1.2-V, 1.5-V, 1.8-V, or 2.5-V bus and a 1.8-V, 2.5-V or 3.6-V bus in mixed 1.2-V, 1.5-V, 1.8-V or 2.5-V/1.8-V, 2.5-V or 3.6-V supply systems.

The A-port interfaces with the 1.2-V, 1.5-V, 1.8-V or 2.5-V bus, the B-port with the 1.8-V, 2.5-V, 3.3-V bus.

The direction of data transmission is determined by the level of the DIR input. The enable input (\overline{OE}) can be used to disable the device so that the buses are effectively isolated. The bus of a B bus side at floating state is maintained in an appropriate logic level due to a bushold circuit to a B bus. Moreover, the bushold circuit which is added to a B bus is off when \overline{OE} is low.

All inputs are equipped with protection circuits against static discharge or transient excess voltage.

 $IOH/IOL = \pm 1$ mA (min) ($VCC = 1.4$ V)
- Latch-up performance: ± 300 mA
- ESD performance: Machine model $\geq \pm 200$ V
Human body model $\geq \pm 2000$ V
- Ultra-small package: VQON24
- Bushold circuit is build in only the B bus side. (Only in $\overline{OE} = "H"$, a former state is maintained.)
- Low current consumption: Using the new circuit significantly reduces current consumption when $\overline{OE} = "H"$.
Suitable for battery-driven applications such as PDAs and cellular phones.
- Floating A-bus and B-bus are permitted. (when $\overline{OE} = "H"$)
- 3.6-V tolerant function provided on A-bus terminal, DIR and \overline{OE} terminal.

Note 1: Do not apply a signal to any bus pins when it is in the output mode. Damage may result.

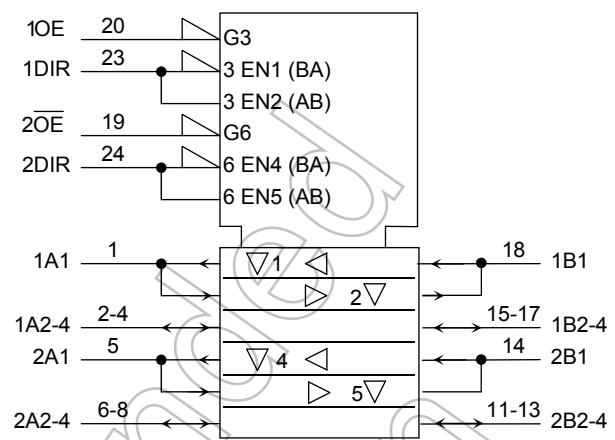

Note: When mounting VQON package, the type of recommended flux is RA or RMA.

Note 1: Exceeding any of the absolute maximum ratings, even briefly, lead to deterioration in IC performance or even destruction.

Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.

Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc.).

Note 2: Don't supply a voltage to V_{CCB} pin when V_{CCA} is in the OFF state.

Note 3: Output in OFF state

Note 4: High or Low stats. I_{OUT} absolute maximum rating must be observed.

Note 5: V_{OUT} < GND, V_{OUT} > V_{CC}

Note: C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation:

$$I_{CC} (\text{opr}) = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}/4 \text{ (per bit)}$$
