

## General Description

The TD9731 is a 2Vrms to 3Vrms Pop&Click-less stereo line driver designed to allow the removal of the output dc-blocking capacitors for reduced component count and cost. The device is ideal for single supply electronics where size and cost are critical design parameters.

The TD9731 is capable of driving 3Vrms into a 2.5kΩ load with 5V supply voltage. The device has single input and uses external gain setting resistors, that supports a gain range of  $\pm 1V/V$  to  $\pm 10V/V$ . The use of external gain resistors also allows the implementation of a 2nd order low pass filter to compliment DAC's and SOC converters. The TD9731 has build-in shutdown control for Pop&Click-free on/off control.

Using the TD9731 in audio products can reduce component count compared to traditional methods of generating a 3Vrms output. The TD9731 doesn't require a power supply greater than 5V to generate its 8.5V<sub>PP</sub> output, nor does it require a split rail power supply. The TD9731 integrates its own charge pump to generate a negative supply rail that provides a clean, pop&click-less ground biased 3Vrms output.

The TD9731 is available in Green MSOP-10 (Exposed Pad) package. It operates over an ambient temperature range of -40°C to +85°C.

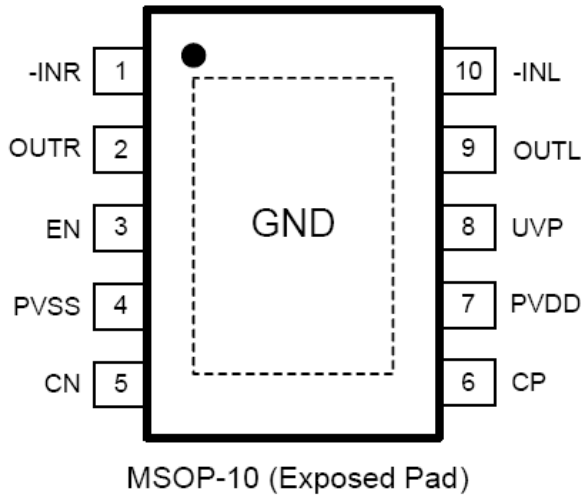

## Features

- Capless Structure
  - Eliminates Pop/Clicks
  - Eliminates Output DC-Blocking Capacitors
  - Provides Flat Frequency Response DC to 20kHz
- Low Noise and THD
  - Typical SNR = 107dB
  - Typical  $V_N = 8\mu V_{rms}$
  - Typical THD+N = 0.001% (f = 1kHz)
- 2Vrms Output Voltage into 2.5kΩ Load with 3.3V Supply Voltage
- 3Vrms Output Voltage into 2.5kΩ Load with 5V Supply Voltage

## Applications

- Set-Top Box
- LCD TV
- Blue-Ray DVD-Players
- Home Theater in a Box

### Pin Configurations

**MSOP-10**  
(Top View)

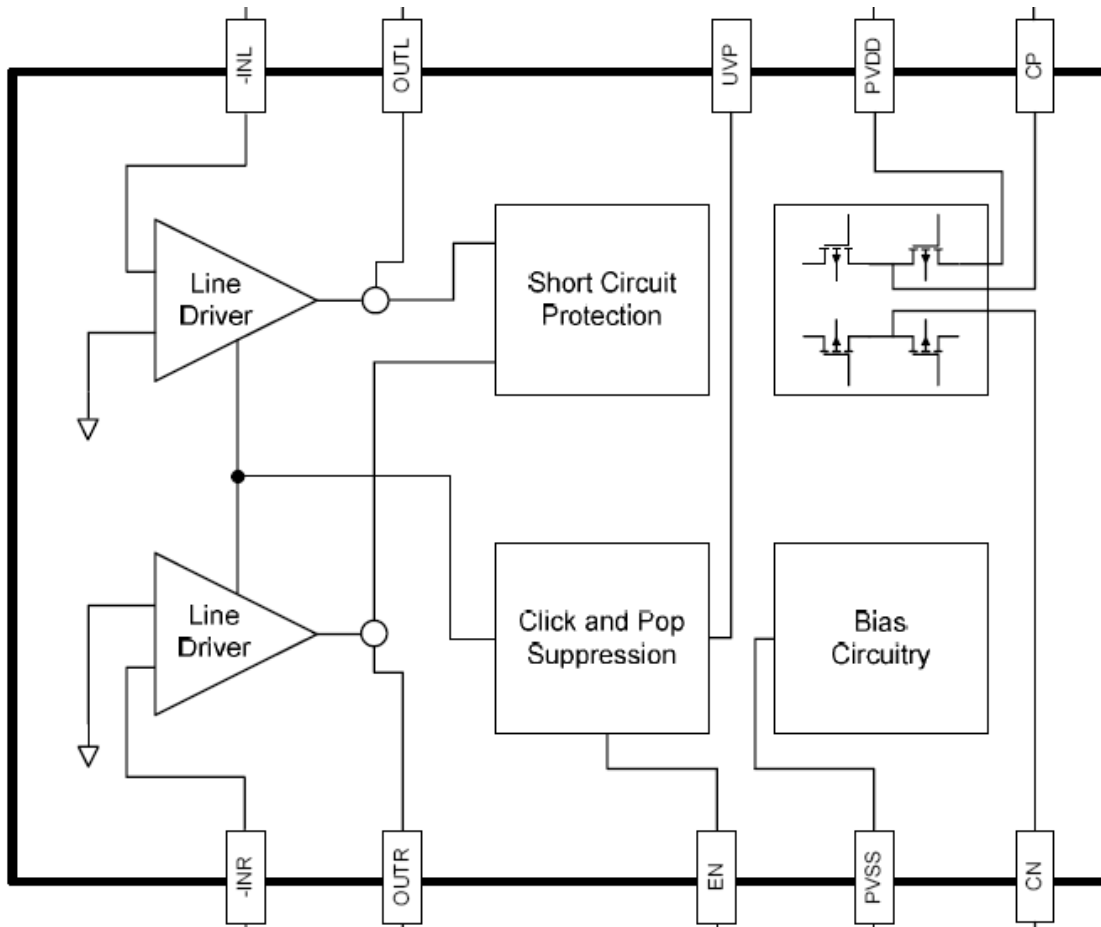

### Pin Description

NO.	NAME	FUNCTION
1	-INR	Right channel OPAMP negative input
2	OUTR	Right channel OPAMP output
3	EN	Enable input, active high
4	PVSS	Negative supply voltage output
5	CN	Charge pump flying capacitor negative terminal
6	CP	Charge pump flying capacitor positive terminal
7	PVDD	Positive supply
8	UVP	Undervoltage protection input
9	OUTL	Left channel OPAMP output
10	-INL	Left channel OPAMP negative input
--	EP	Exposed Paddle. Can only be connected to GND.

## Absolute Maximum Ratings

Symbol	Parameter	Rating	Unit
$V_{PGND\_GND}$	PGND to GND Voltage	-0.3 to 0.3	V
$V_{DD}$	Supply Voltage (VDD to GND and PGND)	-0.3 to 4	
$V_{SDN}$	Input Voltage ( $\overline{SDN}$ to GND)	$V_{GND}-0.3$ to $V_{DD}+0.3$	
$V_{SS}$	VSS to GND and PGND Voltage	-6 to 0.3	
$V_{OUT}$	ROUT and LOUT to GND Voltage	$V_{SS}-0.3$ to $V_{DD}+0.3$	
$V_{CPP}$	CPP to PGND Voltage	$V_{PGND}-0.3$ to $V_{DD}+0.3$	
$V_{CPN}$	CPN to PGND Voltage	$V_{SS}-0.3$ to $V_{PGND}+0.3$	
$T_J$	Maximum Junction Temperature	150	°C
$T_{STG}$	Storage Temperature Range	-65 to +150	
$T_{SDR}$	Maximum Soldering Temperature Range, 10 Seconds	260	
$P_D$	Power Dissipation	Internally Limited	W

Note1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Recommended Operating Conditions

Symbol	Parameter	Range		Unit
		Min.	Max.	
$V_{DD}$	Supply Voltage	3	3.6	V
$V_{IH}$	High Level Threshold Voltage	SDN	1.0	
$V_{IL}$	Low Level Threshold Voltage	$\overline{SDN}$	-	
$T_A$	Operating Ambient Temperature Range	-40	85	°C
$T_J$	Operating Junction Temperature Range	-40	125	°C
$R_L$	Load Resistance	600	100k	$\Omega$

## Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
$\theta_{JA}$	Thermal Resistance - Junction to Ambient <sup>(Note 2)</sup> MSOP-10	120	°C/W

Note 2: Please refer to "Thermal Pad Consideration". 2 layered 5 in2 printed circuit boards with 2oz trace and copper through several thermal vias. The thermal pad is soldered on the PCB.

Line Driver Amplifier

## Function Description

### Line Driver Operation

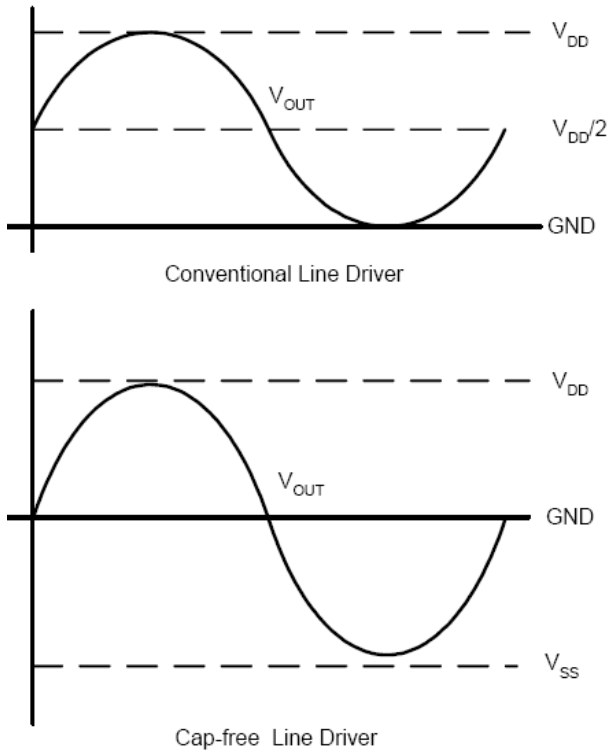

Figure 1. Cap-free Operation

The TD9731's line drivers use a charge pump to invert the positive power supply ( $V_{DD}$ ) to negative power supply ( $V_{SS}$ ), see figure1. The headphone drivers operate at this bipolar power supply ( $V_{DD}$  and  $V_{SS}$ ) and the outputs reference refers to the ground. This feature eliminates the output capacitor that is using in conventional single-ended headphone drive amplifier. Compare with the single power supply amplifier, the power supply range has almost doubled.

### Thermal Protection

The thermal protection circuit limits the junction temperature of the TD9731. When the junction temperature exceeds  $T_J=+150^{\circ}C$ , a thermal sensor turns off the driver, allowing the devices to cool. The thermal sensor allows the driver to start-up after the junction temperature down about  $125^{\circ}C$ . The thermal protection is designed with a  $25^{\circ}C$  hysteresis to lower the average  $T_J$  during continuous thermal overload conditions, increasing lifetime of the ICs.

### Shutdown Function

In order to reduce power consumption while not in use, the TD9731 contains shutdown controllers to externally turn off the amplifier bias circuitry. This shutdown feature turns the amplifier off when logic low is placed on the SDN pins for the TD9731. The trigger point between a logic high is 1.0V and logic low level is 0.35V. It is recommended to switch between ground and the supply voltage  $V_{DD}$  to provide maximum device performance. By switching the SDN pins to a low level, the amplifier enters a low-consumption current circumstance, charge pump is disabled, and  $I_{DD}$  for the TD9731 is in shutdown mode. In normal operating, the TD9731's SDN pins should be pulled to a high level to keep the IC out of the shutdown mode. The SDN pins should be tied to a definite voltage to avoid unwanted circumstance changes.

### Under-Voltage Protection

External under voltage detection can be used to shutdown the TD9731 before an input device can generate a pop. The shutdown threshold at the UVP pin is 1.25V. The user selects a resistor divider to obtain the shutdown threshold and hysteresis for the specific application. The thresholds can be determined as below:

$$V_{UVP} = (1.25 - 6\mu A \times R_3) \times (R_1 + R_2) / R_2$$

$$\text{Hysteresis} = 5\mu A \times R_3 \times (R_1 + R_2) / R_2$$

$$\text{With the condition: } R_3 \gg R_1 // R_2$$

For example, to obtain  $V_{UVP}=3.8V$  and 1V hysteresis,  $R_1=3k\Omega$ ,  $R_2=1k\Omega$  and  $R_3=50k\Omega$ .

Figure 2. Under-Voltage Protection

## Application Information

### Using The TD9731 As A Second-Order Filter

Several audio DACs used today require an external lowpass filter to remove out-of-band noise. This is possible with the TD9731, as it can be used like a standard Operational Amplifier. Several filter topologies can be implemented, single-ended and differential. In Figure3, An ac-coupling capacitor to remove dc content from the source is shown; it serves to block any dc content from the source and lowers the dc-gain to 1, helping reducing the output dc-offset to minimum.

Figure 3. Second-Order Active Low-Pass Filter

Gain (V/V)	High Pass (Hz)	Low Pass (kHz)	C1 (pF)	C2 (pF)	C3 (μF)	R1 (kΩ)	R2 (kΩ)	R3 (kΩ)
-1	1.6	40	100	680	10	10	10	24
-1.5	1.3	40	68	680	15	8.2	12	30
-2	1.6	60	33	150	6.8	15	30	47
-2	1.6	30	47	470	6.8	15	30	43
-3.33	1.2	30	33	470	10	13	43	43
-10	1.5	30	22	1000	22	4.7	47	27

For Inverting Input, The overall gain is:

$$A_v = -\frac{R_2}{R_1}$$

The high pass filter's cutoff frequency is:

$$f_{c(\text{highpass})} = \frac{1}{2\pi R_1 C_3}$$

The low pass filter's cutoff frequency is:

$$f_{c(\text{lowpass})} = \frac{1}{2\pi \sqrt{R_2 R_3 C_1 C_2}}$$

### Input Capacitor, Ci

Figure 4. Typical Application Circuit

In the typical application, an input capacitor,  $C_i$ , is required to allow the amplifier to bias the input signal to the proper DC level for optimum operation. In this case,  $C_i$  and the minimum input impedance  $R_i$  from a high-pass filter with the corner frequency are determined in the following equation:

$$f_{c(\text{highpass})} = \frac{1}{2\pi R_i C_i}$$

The value of  $C_i$  must be considered carefully because it directly affects the low frequency performance of the circuit.  $R_i$  is the external input resistance that typical value is 10kΩ and the specification calls for a flat bass response down to 20Hz. Equation is reconfigured as below:

$$C_i = \frac{1}{2\pi R_i f_{c(\text{highpass})}}$$

When the input resistance variation is considered, the  $C_i$  is 0.8μF, so a value in the range of 1μF to 2.2μF would be chosen. A further consideration for this capacitor is the leakage path from the input source through the input network ( $R_i + R_f$ ,  $C_i$ ) to the load.

This leakage current creates a DC offset voltage at the input to the amplifier that reduces useful headroom, especially in high gain applications. For this reason, a low leakage tantalum or ceramic capacitor is the best choice. When polarized capacitors are used, the negative side of the capacitor should face the amplifiers' input in most applications because the DC level of the amplifiers' input is held at GND. Please note that it is important to confirm the capacitor polarity in the application.

### Input Resistor, Ri

The gain of the TD9731 is set by the external input resistor ( $R_i$ ) and external feedback resistor ( $R_f$ ). Please see the figure 4.

## Application Information(Cont.)

### Input Resistor, $R_i$ (Cont.)

$$\text{Gain } (A_v) = \frac{R_f}{R_i}$$

The external gain setting is recommended using from  $-1V/V$  to  $-10V/V$ , and the  $R_i$  is in the range from  $1k\Omega$  to  $47k\Omega$ . It's recommended to use 1% tolerance resistor or better. Keep the input trace as short as possible to limit the noise injection. The gain is recommended to set  $-1V/V$ , and  $R_i$  is  $10k\Omega$ , and  $R_f$  is  $10k\Omega$ .

### Feedback Resistor, $R_f$

Refer the figure 4, the external gain is setting by  $R_i$  and  $R_f$ ; and the gain setting is recommended using from  $-1V/V$  to  $-10V/V$ . The  $R_f$  is in the range from  $4.7k\Omega$  to  $100k\Omega$ . It's recommended to use 1% tolerance resistor or better.

### Power Supply Decoupling, $C_s$

The TD9731 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure the output total harmonic distortion (THD+N) is as low as possible. Power supply decoupling also prevents the oscillations being caused by long lead length between the amplifier and the speaker.

The optimum decoupling is achieved by using two different types of capacitors that target on different types of noise on the power supply leads. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically  $0.1\mu F$ , is placed as close as possible to the device VDD and PVDD lead for the best performance. For filtering lower frequency noise signals, a large aluminum electrolytic capacitor of  $10\mu F$  or greater placed near the audio power amplifier is recommended.

### Charge Pump Flying Capacitor, $C_{CPF}$

The flying capacitor affects the load transient of the charge pump. If the capacitor's value is too small, then that will degrade the charge pump's current driver capability and the performance of line drive amplifier.

Increasing the flying capacitor's value will improve the load transient of charge pump. It is recommended using the low ESR ceramic capacitors (X7R type is recommended) above  $1\mu F$ .

### Charge Pump Output Capacitor, $C_{CPO}$

The output capacitor's value affects the power ripple directly at  $CV_{SS}$  ( $V_{SS}$ ). Increasing the value of output capacitor reduces the power ripple. The ESR of output capacitor affects the load transient of  $CV_{SS}$  ( $V_{SS}$ ). Lower ESR and greater than  $1\mu F$  ceramic capacitor is a recommendation.
