## Low power VHF, UHF and hyperband mixer/oscillator for TV and VCR 3-band tuners

## TDA5731M

### FEATURES

- Balanced mixer with a common emitter input for band A (single input)
- 2-pin oscillator for bands A and B
- 3-pin oscillator for band C
- Balanced mixer with a common base input for band B and C (balanced input)
- Local oscillator buffer output for external synthesizer
- SAW filter preamplifier with a low output impedance to drive the SAW filter directly
- Electronic band switch.

### APPLICATIONS

- 3-band TV tuners
- 3-band TV front-ends
- 3-band VCR tuners
- 3-band VCR front-ends.

### GENERAL DESCRIPTION

The TDA5731M is a monolithic integrated circuit that performs the band A, band B and band C mixer/oscillator functions in TV and VCR tuners. This low power mixer/oscillator circuit requires a power supply of 5 V and is available in a very small package outline. This device gives the designer the capability to design an economical and physically small 3-band tuner. The tuner development time can be drastically reduced by using this device.

In addition, when hyperband is not required, the TDA5731M may be used in a VHF/UHF tuner with an appropriate tuned circuit for VHF1 and VHF111 in band A and the tuned circuit of band C for UHF.

### QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_P$	supply voltage		–	5.0	–	V
$I_P$	supply current		–	36	–	mA
$f_R$	frequency range	band A	42	–	180	MHz
		band B	160	–	470	MHz
		band C	430	–	860	MHz
N	noise figure	band A	–	7.5	–	dB
		band B	–	8.0	–	dB
		band C	–	9.0	–	dB
IP	intermodulation	band A	–	–66	–	dB
		band B	–	–66	–	dB
		band C	–	–66	–	dB
$G_V$	voltage gain	band A	–	23	–	dB
		band B	–	34	–	dB
		band C	–	33	–	dB

## LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	MIN.	MAX/	UNIT
$V_P$	supply voltage	-0.3	+7.0	V
$V_{SW(max)}$	maximum switching voltage	-0.3	+7.5	V
$V_{P(op)}$	operating supply voltage	4.5	5.5	V
$V_{n(max)}$	maximum voltage on each pin with a 22 k $\Omega$ resistor connected in series	-	35	V
$I_O$	output current of each pin to ground	-	-10	mA
$t_{sc(max)}$	maximum short-circuit time (all pins)	-	10	s
$T_{stg}$	storage temperature	-55	+150	$^{\circ}$ C
$T_{amb}$	operating ambient temperature	-10	+80	$^{\circ}$ C
$T_j$	junction temperature	-	+150	$^{\circ}$ C

## THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j-a}$	thermal resistance from junction to ambient in free air	120	K/W

## HANDLING

Human Body Model: GND (8), RFGND (18),  $V_P$  (14) shorted together. Pins 4, 6 and 7 withstand 500 V. All other pins withstand 2000 V.

Machine Model: GND (8), RFGND (18),  $V_P$  (14) shorted together. Pins 4, 6 and 7 withstand 50 V. All other pins withstand 200 V.

## IF AMPLIFIER CHARACTERISTICS

$V_P = 5$  V;  $T_{amb} = 25$   $^{\circ}$ C; differentially measured at 36 MHz; measured in circuit of Fig.6; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.		MAX.	UNIT
				MOD.	PHASE		
$S_{22}$	output reflection coefficient	note 1; see Fig.11	-	-14	+9	-	dB/ $^{\circ}$
$Z_o$	output impedance ( $R_s + L_s$ )	$R_s$	-	74		-	$\Omega$
		$L_s$	-	21		-	nH

### Note

- All S parameters are referenced to a 50  $\Omega$  system.

**Notes**

- Cross modulation measurement is achieved using the 3 equal signals method (see Fig.4).
- The gain is defined as the transducer gain (measured in Fig.8) plus the voltage transformation ratio of L7 to L8 (5 : 1, 15.4 dB).
- The frequency shift is defined as a change in oscillator frequency for a variation of supply voltage. In one instance  $V_P = 5$  to  $4.75$  V and in the other instance  $V_P = 5$  to  $5.25$  V. In both cases, the frequency shift is below the specified value.
- The frequency ripple susceptibility is measured at 500 kHz at the LO output (see Fig.5). The level of the ripple signal is increased until a difference of 53.5 dB is reached at the IF output.
- The frequency drift is defined as the change in oscillator frequency for a variation of ambient temperature, on the one hand from  $T_{amb} = 25$  °C to  $T_{amb} = 0$  °C and on the other hand from  $T_{amb} = 25$  °C to  $T_{amb} = 50$  °C.
- The capacitors in the oscillator circuits of Fig.8 are as follows:
  - Band A: C1, C5 and C7.
  - Band B: C4 and C9 and C11.
  - Band C: C2, C3, C6, C8 and C10 are NP0 types.
- Switching on drift is the change in oscillator frequency between 5 seconds and 15 minutes after switching on.
- The values have been corrected for hybrid and cable losses. The symmetrical output impedance of the circuit is 100  $\Omega$ .

## TDA5731M

9. The input level of a  $N + 5 - 1$  MHz signal which gives a signal 30 dB below the oscillator carrier at the LO output.
10. Measured at  $50 \Omega$  with the following RF input voltages;
- RF voltage level =  $120 \text{ dB}\mu\text{V}$  at  $f_i < 180 \text{ MHz}$ .
  - RF voltage level =  $107.5 \text{ dB}\mu\text{V}$  at  $f_i = 180 \text{ to } 225 \text{ MHz}$ .
  - RF voltage level =  $97 \text{ dB}\mu\text{V}$  at  $f_i = 225 \text{ to } 860 \text{ MHz}$ .

**(a) For  $f_R = 50 \text{ MHz}$ :**

mixer A frequency response measured = 57 MHz, loss = 0 dB  
 image suppression = 16 dB  
 $C1 = 9 \text{ pF}$   
 $C2 = 15 \text{ pF}$   
 $L1 = 7 \text{ turns } (\Delta 5.5 \text{ mm, wire dia.} = 0.5 \text{ mm})$   
 $I1 = \text{rigid cable (RIM): } 5 \text{ cm long}$   
 (rigid cable (RIM); 33 dB/100 m;  $50 \Omega$ , 96 pF/m).

**(b) For  $f_R = 180 \text{ MHz}$ :**

mixer A frequency response measured = 150.3 MHz, loss = 1.3 dB  
 image suppression = 13 dB  
 $C3 = 5 \text{ pF}$   
 $C4 = 25 \text{ pF}$   
 $I2 = \text{rigid cable (RIM): } 30 \text{ cm long}$   
 $I3 = \text{rigid cable (RIM): } 5 \text{ cm long}$   
 (rigid cable (RIM); 33 dB/100 m;  $50 \Omega$ ; 96 pF/m).

TDA5731M

### SOLDERING

#### Plastic small outline packages

##### BY WAVE

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 s, if allowed to cool to less than 150 °C within 6 s. Typical dwell time is 4 s at 250 °C.

A modified wave soldering technique is recommended using two solder waves (dual-wave), in which a turbulent wave with high upward pressure is followed by a smooth laminar wave. Using a mildly-activated flux eliminates the need for removal of corrosive residues in most applications.

##### BY SOLDER PASTE REFLOW

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be

applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 s according to method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 min at 45 °C.

#### REPAIRING SOLDERED JOINTS (BY HAND-HELD SOLDERING IRON OR PULSE-HEATED SOLDER TOOL)

Fix the component by first soldering two, diagonally opposite, end pins. Apply the heating tool to the flat part of the pin only. Contact time must be limited to 10 s at up to 300 °C. When using proper tools, all other pins can be soldered in one operation within 2 to 5 s at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages.)

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to the substrate by dipping or by an extra thick tin/lead plating before package placement.

### DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

### LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
