

## AM/FM TUNER FOR CAR RADIO AND HI-FI APPLICATIONS

PRELIMINARY DATA

- HIGH PERFORMANCE FRONT-END IC FOR AM/FM RECEIVERS
- FULLY INTEGRATED HIGH-SPEED PLL FOR OPTIMIZED RDS APPLICATIONS
- FM MPX/AM AUDIO OUTPUT, 450kHz AM IF OUTPUT FOR STEREO AM APPLICATIONS
- AM DOUBLE CONVERSION ARCHITECTURE
- AM/FM STATION DETECTOR AND DIGITAL IF-COUNTER
- SINGLE FREQUENCY REFERENCE FOR BOTH AM AND FM
- FULL ELECTRICAL ADJUSTMENT
- I<sup>2</sup>C-BUS PROGRAMMABLE

### DESCRIPTION

The TDA7421N is a high-performance tuner circuit which integrates AM and FM sections, PLL frequency synthesizer and IF counter on a single chip. Use of BICMOS technology allows the implementation of tuning functions with a minimum of external components. Value spread of external components can be fully compensated by means of on-chip elec-

trical adjustment controlled by external  $\mu$ P. The FM quality detection circuit, in conjunction with the digital IF counter, enables the stop-station function in "seek" mode and MPX mute during reception. The combination of programmable level detector and IF counter allows reliable AM stop-station performance. The Automatic Gain Control (AGC) operates on different signal bandwidths in order to optimize sensitivity and dynamic range. I<sup>2</sup>C-bus controls functions such as AGC, amplifier gains, PLL and counter settings.

### PIN CONNECTIONS

BLOCK DIAGRAM

**ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	Value	Unit
T <sub>amb</sub>	Operating Temperature Range	-40 to 85	°C
T <sub>stg</sub>	Storage Temperature Range	-55 to 150	°C
V <sub>CC</sub>	Analog Supply Voltages (PLL, RF, IF1, IF2, OSC)	10.2	V
V <sub>DD</sub>	Digital Supply Voltage	5.5	V

**THERMAL DATA**

Symbol	Parameter	Typ. Value	Unit
R <sub>th j-amb, fa</sub>	Thermal Resistance Junction-Ambient, Free Air	68	°C/W
R <sub>th j-amb, sol</sub>	Thermal Resistance Junction-Ambient, Soldered	55	°C/W

**PIN DESCRIPTION**

N.	Name	Function
1	AM MIX1 IN -	AM 1 <sup>st</sup> mixer negative input (differential -)
2	AM MIX1 IN +	AM 1 <sup>st</sup> mixer positive input (differential +)
3	FM MIX1 IN -	FM mixer negative input (differential -)
4	FM MIX1 IN +	FM mixer positive input (differential +)
5	FM RF AGC IN	RF AGC input
6	FM AGC OUT	FM AGC output voltage
7	RF GND	RF ground
8	VCO B	Local oscillator input to the transistor base
9	VCO E	Local oscillator input to the transistor emitter
10	OSC GND	Oscillator ground
11	XTAL D	Crystal oscillator MOS amplifier output
12	XTAL G	Crystal oscillator MOS amplifier input
13	OSC VCC	Oscillator positive supply
14	FM ANT ADJ	Tuning varicap voltage for antenna FM filter
15	FM RF ADJ	Tuning varicap voltage for RF FM filter
16	PLL VCC	PLL positive supply
17	LP OUT	Op Amp output to PLL loop filters
18	LP IN1	FM loop filter connection to op-amp inverting input
19	LP IN2	AM loop filter connection to op-amp inverting input

## PIN DESCRIPTION (Continued)

N.	Name	Function
20	LP IN3	FM-HS loop filter connection to op-amp inverting input
21	PLL VREF	Voltage reference to Op Amp noninverting input
22	PLL GND	PLL ground
23	SLEEP	I <sup>2</sup> C bus disconnect signal
24	SDA	I <sup>2</sup> C bus data
25	SCL	I <sup>2</sup> C bus clock
26	DIG VDD	Digital positive supply
27	DIG GND	Digital ground
28 (*)	IFC SSTOP AM STEREO OUT	IF-Counter stop signal or AM IF2 amplifier output
29	CLN GND	"Clean" ground
30	IF2 GND	IF2 ground
31	AM AGC2 TC	AM 2 <sup>nd</sup> AGC time constant
32	AM DET	AM detector capacitor
33	AM BPF	AM IF filter
34	AM REF	Reference voltage of AM IF amplifier
35	AM IF2 in	AM IF2 amplifier input
36	IF2 VCC	IF2 positive supply
37	FM QUAD -	FM quadrature detector tank (differential -)
38	FM QUAD +	FM quadrature detector tank (differential +)
39	AUDIO OUT	FM MPX/AM Audio output
40 (*)	FM SD AM SD	FM station detector output or AM station detector output
41 (*)	FM SMETER AM SMETER FM DET ADJ	FM S-meter output or AM S-meter output or FM detector adjustment output
42	FM MUTE DRIVE	FM mute time constant
43	FM BW TC	FM detuning detector time constant
44	IF1 GND	IF1 ground
45	FM LIM IN -	FM limiter negative input (differential -)
46	FM LIM IN +	FM limiter negative input (differential +)
47	IF1 VCC	IF1 positive supply
48	FM IF AMP2 OUT	FM 2 <sup>nd</sup> IF amplifier output

## PIN DESCRIPTION (Continued)

N.	Name	Function
49	FM IF AMP2 IN -	FM 2 <sup>nd</sup> IF amplifier negative input (differential -)
50	FM IF AMP2 IN +	FM 2 <sup>nd</sup> IF amplifier positive input (differential +)
51	FM IF AMP1 OUT	FM 1 <sup>st</sup> IF amplifier output
52	FM IF AMP IN -	FM 1 <sup>st</sup> IF amplifier negative input (differential -)
53	FM IF AMP IN +	FM 1 <sup>st</sup> IF amplifier positive input (differential +)
54	AM S-METER TC	AM S-meter time constant
55	AM MIX2 OUT	AM 2 <sup>nd</sup> mixer output
56	RF VCC	RF positive supply
57	AM MIX2 IN -	AM 2nd mixer negative input (differential -)
58	AM MIX2 IN +	AM 2nd mixer positive input (differential +)
59	FM IF AGC IN	FM IF AGC input
60	MIX OUT -	FM/AM 1 <sup>st</sup> mixer negative output (differential -)
61	MIX OUT +	FM/AM 1 <sup>st</sup> mixer positive output (differential +)
62	AM AGC1 TC	AM 1 <sup>st</sup> AGC time constant
63	AM AGC1 RF AMP	AM 1 <sup>st</sup> AGC voltage output (to RF amplifier)
64	AM AGC1 PIN	AM 1 <sup>st</sup> AGC current output (to antenna attenuation diodes)

(\*) Pin function is user defined by software.

**FM SECTION GLOBAL PERFORMANCES**

Refer to Evaluation Circuit

- Input 98.1MHz, 40KHz dev., 1KHz mod., 60dB $\mu$ V antenna level, mono.
- MPX Output, de-emphasis 50 $\mu$ s, BPF 200Hz-15KHz.

Symbol	Parameter	Test Condition	Min.	Typ.	Max.	Unit
FM I <sub>CC</sub>	Total Supply Current Including Mixer			90		mA
S+N/N	Signal to Noise Ratio			66		dB
THD	Total Harmonic Distortion			0.3		%
V <sub>O AF</sub>	Audio Output Level	75kHz Deviation		400		mV <sub>RMS</sub>
US <sub>1</sub>	Usable Sensitivity (40dB)	antenna level at which S+N/N = 40dB		0		dB $\mu$ V
US <sub>2</sub>	Usable Sensitivity (26dB)	antenna level at which S+N/N = 26dB		-6		dB $\mu$ V
AGC <sub>SP</sub>	AGC Starting point			55		dB $\mu$ V

**AM SECTION GLOBAL PERFORMANCES**

Refer to Evaluation Circuit

- Input: f<sub>c</sub> = 999KHz, f<sub>mod</sub> = 400Hz, m = 30%, 74dB $\mu$ V<sub>emf</sub> antenna level unless otherwise specified.
- Audio Output + RC BPF (BPF 20Hz - 20KHz)

$\Delta$ I <sub>CC</sub>	Total supply current including mixers			80		mA
V <sub>IN MIN</sub>	Maximum Sensitivity	$\Delta$ V <sub>AF</sub> = -20dB		13		dB $\mu$ V (emf)
V <sub>IN US</sub>	Usable Sensitivity	S+N/N = 20dB		27		dB $\mu$ V (emf)

Figure 1. AM Test Circuit

Figure 2. FM Test Circuit

## 1.0 FM SECTION

Featuring a single conversion configuration, it comprises a multi-stage IF limiter whose gain is  $\dot{P}_C$  controlled and a quadrature demodulator with detuning and adjacent channel detectors. Signal meter and stop station functions are also supported

## 2.0 AM SECTION

AM signal is converted by means of UP-DOWN configuration (IF1 = 10.7MHz, IF2 = 450KHz) and MW/LW bands are covered.

## 3.0 PLL SECTION

Three operating modes are available:

PM0	PM1	Operating Mode
0	0	Standby
1	0	AM
0	1	not used
1	1	FM

They are user programmable with the mode PM registers.

### 3.1 Standby mode

It stops all functions. This allows low current consumption without loss of information in all registers. The pin LP-OUT is forced to 0V in power on. All data registers are set to FE (11111110). The oscillator does not run in standby mode.

### 3.2 FM and AM Operation

The FM or AM signal applies to a 32/33 prescaler, which is controlled by a 5 bit counter (A). The 5 bit register (PC0 to PC4) controls this divider.

The output of the prescaler connects to a 11 bit divider (B). The 11 bit register (PC5 to PC15) controls the divider 'B'.

#### 3.2.1 THREE STATE PHASE COMPARATOR

The phase comparator generates a phase error signal according to phase difference between fSYN and fREF. This phase error signal drives the charge pump current generator.

#### 3.2.2 CHARGE PUMP CURRENT GENERATOR

This stage generates signed pulses of current. The phase error signal decides the duration and polarity of those pulses. The current absolute values are programmable by A0, A1, A2 registers for high current and B0, B1 registers for low current.

#### 3.2.3 LOW NOISE CMOS OP-AMP

An internal voltage divider at pin VREF connects the positive input of the low noise Op-Amp. The charge pump output connects the negative input. This internal amplifier in cooperation with external components can provide an active filter. The negative input is switchable to three input pins (LPIN 1, LPIN 2 and LPIN 3), to increase the flexibility in application. This feature allows two separate active filters for different applications. A logical "1" in the LPIN 1/2 register activates pin LPIN 1, otherwise pin LPIN 2 is active. While the high current mode is activated LPIN 3 is switched on.

### 3.2.4 INLOCK DETECTOR

The charge pump is switched in low current mode as the truth table and the related figure shows.

CURRHIGH	LOCKENA	LOCK (by inlock detector)	Charge PumpCurrent
0	X	X	low current
1	1	1	low current
1	1	0	High current
1	0	1	High current
1	0	0	High current

The charge pump is forced in low current mode when a phase difference of 10-40 usec is reached.

A phase difference larger than the programmed values will switch the charge pump immediately in the high current mode.

Few programmable delays are available for inlock detection.

### 4.0 IF COUNTER SYSTEM FOR AM/FM

The IF counter mode is controlled by IFCM register:

IFCM1	IFCM0	FUNCTION
0	0	NOT USED
0	1	FM MODE
1	0	AM MODE
1	1	NOT USED

A sample timer to generate the gate signal for the main counter is built with a 14 bit programmable counter to have the possibility to use any frequency. In FM mode a 6.25 KHz, in AM mode a 1KHz signal is generated. This counter is followed by an asynchronous divider to generate several sampling times.

#### ADDRESS ORGANIZATION (PLL and IF Counter)

		MSB							LSB	
FUNCTION	SUBAD	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0	
PLL CHARGE PUMP	00H	LPIN1/2	CURRH	B1	B0	A3	A2	A1	A0	
LL COUNTER	01H	PC7	PC6	PC5	PC4	PC3	PC2	PC1	PC0	
PLL COUNTER	02H	PC15	PC14	PC13	PC12	PC11	PC10	PC9	PC8	
LL REF COUNTER	03H	RC7	RC6	RC5	RC4	RC3	RC2	RC1	RC0	
LL REF COUNTER	04H	RC15	RC14	RC13	RC12	RC11	RC10	RC9	RC8	
LL LOCK DETECT	05H	LDENA	-	D3	D2	D1	D0	PM1	PM0	
FC REF COUNTER	06H	IRC7	IRC6	IRC5	IRC4	IRC3	IRC2	IRC1	IRC0	
FC REF COUNTER	07H	IFCM1	IFCM0	IRC13	IRC12	IRC11	IRC10	IRC9	IRC8	
FC CONTROL	08H	IFENA	-	-	-	-	EW2	EW1	EW0	
C CONTROL	09H	IFS2	IFS1	IFS0	CF4	CF3	CF2	CF1	CF0	

#### 4.1 Intermediate Frequency Main Counter (IFMC)

This counter is a 13-21 bit synchronous autoreload down-counter. Four bits are programmable to have the possibility for an adjust to the frequency of the IF filter. The counter length is automatically adjusted to the chosen sampling time and the counter mode. At the start the counter will be loaded with a defined value which is an equivalent to the divider value ( $t_{\text{sample}} \cdot f_{\text{IF}}$ ). If a correct frequency is applied to the IF counter frequency inputs IF-AM and IF-FM, at the end of the sampling time the main counter is changing its state from 0 to 1FFFFFFH. This is detected by a control logic. The frequency range inside which a successful count results is detected is adjustable setting bits EW 0, 1, 2.

#### 4.2 Up-down counter filter

The information coming from the IF main counter control logic is shifted into a 5 bit up down counter circuit clocked by the sampling time signal. At the start (rising edge of the IFENA signal) the counter is set to 10H and the SSTOP signal is forced to "1". Only when the counter reaches the value 10H - step, SSTOP goes to "0". SSTOP will be "1" again, if the counter reaches the value 10h + step.

Figure 3. Charge Pump Logic

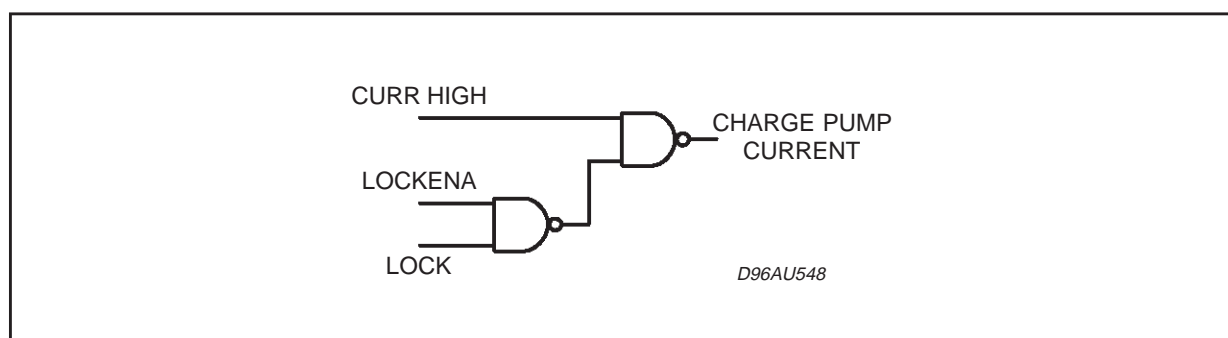

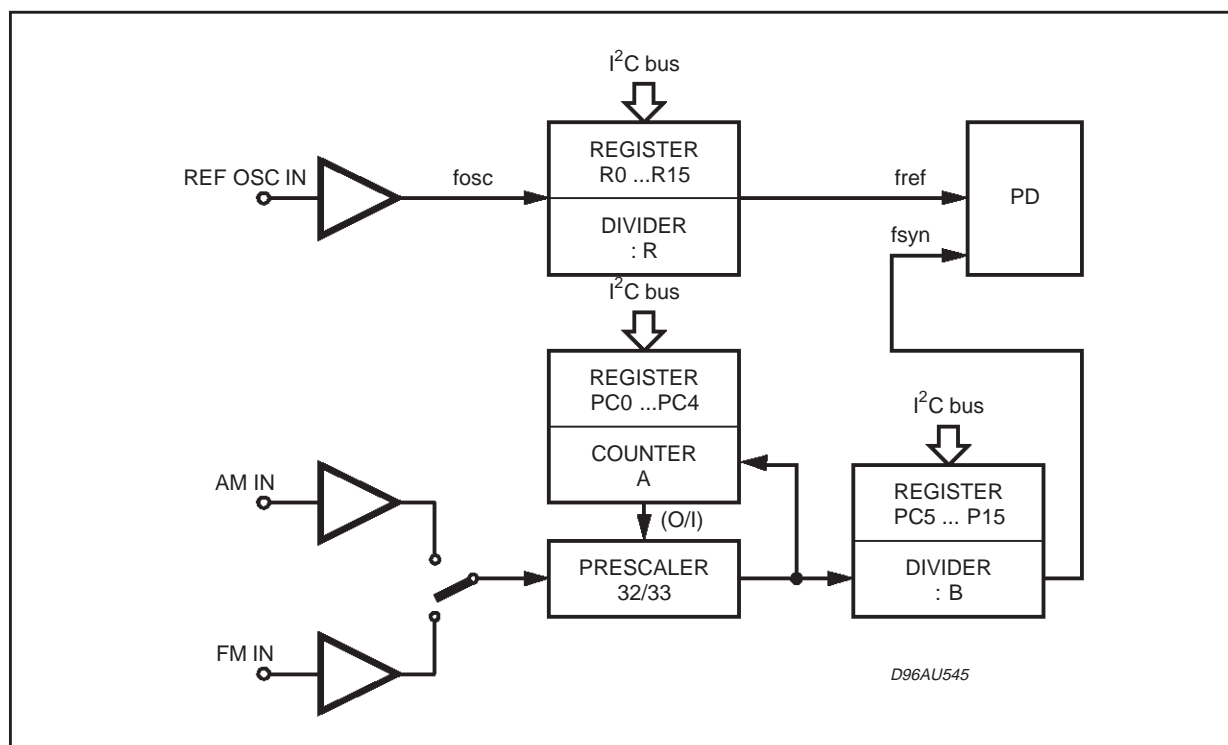

Figure 4. FM and AM operation (swallow mode)

$$t_{tim} = (IFRC + 1) / f_{osc}$$

$$t_{cnt} = (CF + 1697) / f_{IF \text{ FM mode}}$$

$$t_{cnt} = (CF + 44) / f_{IF \text{ AM mode}}$$

Counter result succeeded:

$$t_{tim} > t_{cnt} - t_{err} \text{ and}$$

$$t_{tim} > t_{cnt} + t_{err}$$

Counter result failed:

$$t_{tim} < t_{cnt} + t_{err} \text{ or}$$

$$t_{tim} > t_{cnt} - t_{err}$$

where:

$t_{tim}$  = IF time cycle time

$t_{cnt}$  = IF counter cycle time

$t_{err}$  = discrimination window (controlled by the EW registers)

The precision of the measurements is adjustable by controlling the discrimination window. This is adjustable by programming the control registers EW0...EW2.

The measurement time per cycle is adjustable by setting the register IFS0 - IFS2.

The center frequency of the discrimination window is adjustable by the control register "CF0" to "CF4". The available values are reported in databyte specification

## 5.0 I<sup>2</sup>C BUS INTERFACE

### 5.1 General Description

The TDA7421N supports the I2C bus protocol. This protocol defines the devices sending data into the bus as transmitter and the receiving device as the receiver.

The device that controls the transfer is a master and the device being controlled is the slave. The master will always initiates data transfer and provide the clock to transmit or receive operations.

### 5.2 Data Transition

Data transition on the SDA line must only occur when the clock SCL is low. SDA transitions while SCL is high will be interpreted as START or STOP condition.

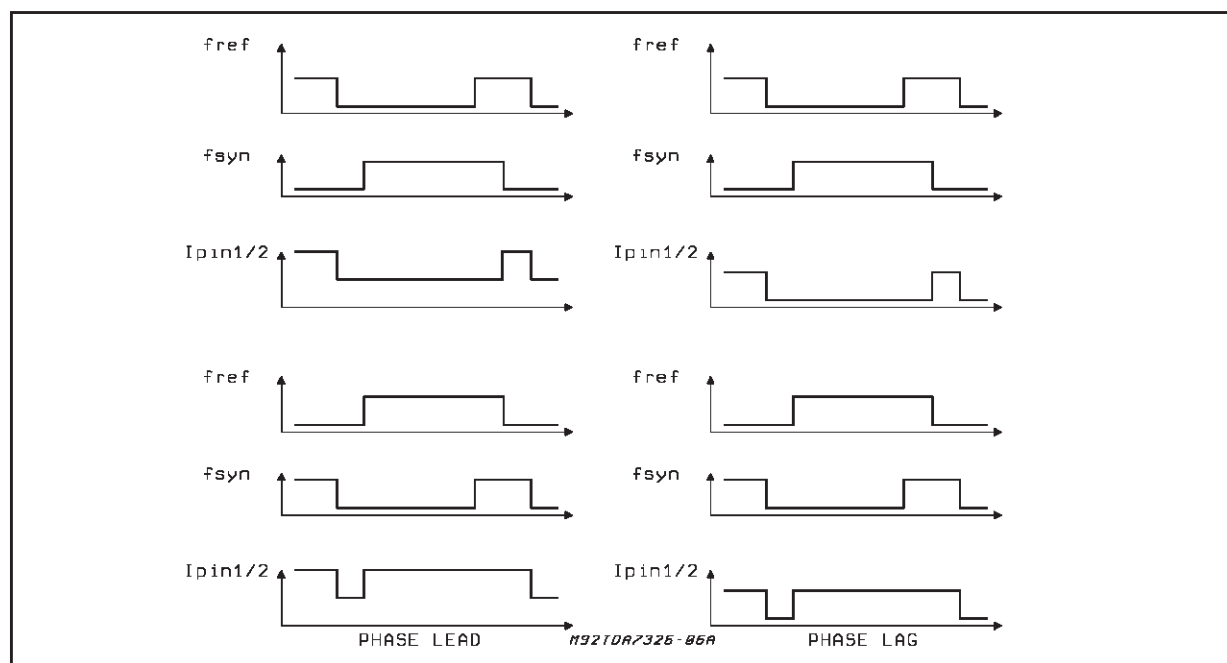

### 5.3 Start Condition

A start condition is defined by a HIGH to LOW transition of the SDA line while SCL is at a stable HIGH level. This START condition must precede any command and initiate a data transfer onto the bus. The TDA7421N continuously monitors the SDA and SCL lines for a valid START and will not response to any command if this condition has not been met.

### 5.4 Stop condition

A STOP condition is defined by a LOW to HIGH transition of the SDA while the SCL line is at a stable HIGH level. This condition terminate the communication between the devices and force's the bus interface of the TDA7421N into the initial condition.

Figure 5. Phase Comparator

### 5.5 Acknowledge

Indicates a successful data transfer. The transmitter will release the bus after sending 8 bit of data. During the 9th clock cycle the receiver will pull the SDA line to LOW level to indicate it has received the eight bits of data correctly.

### 5.6 Data transfer

During data transfer the TDA7421N samples the SDA line on the leading edge of the SCL clock, Therefore, for proper device operation the SDA line must be stable during the SCL LOW to HIGH transition.

### 5.7 Device Addressing

To start the communication between two devices, the bus master must initiate a start instruction sequence, followed by an eight bit word corresponding to the address of the device it is addressing. The most significant 6 bits of the slave address identify the device type.

The TDA7421N device code is fixed as "110001".

The next significant bit is used either to address the tuner section (1) or the PLL section (0) of the chip.

Following a START condition the master sends slave address word; the TDA7421N will "acknowledge" after this first transmission and wait for a second word (the word address field). This 8 bit address field provides an access to any of the 8 internal addresses. Upon receipt of the word address the TDA7421N slave device will respond with an "acknowledge".

At this time, all the following words transmits to the TDA7421N will be considered as data. The internal address will be automatically incremented. After each word receipt the TDA7421N will answer with an "acknowledge".

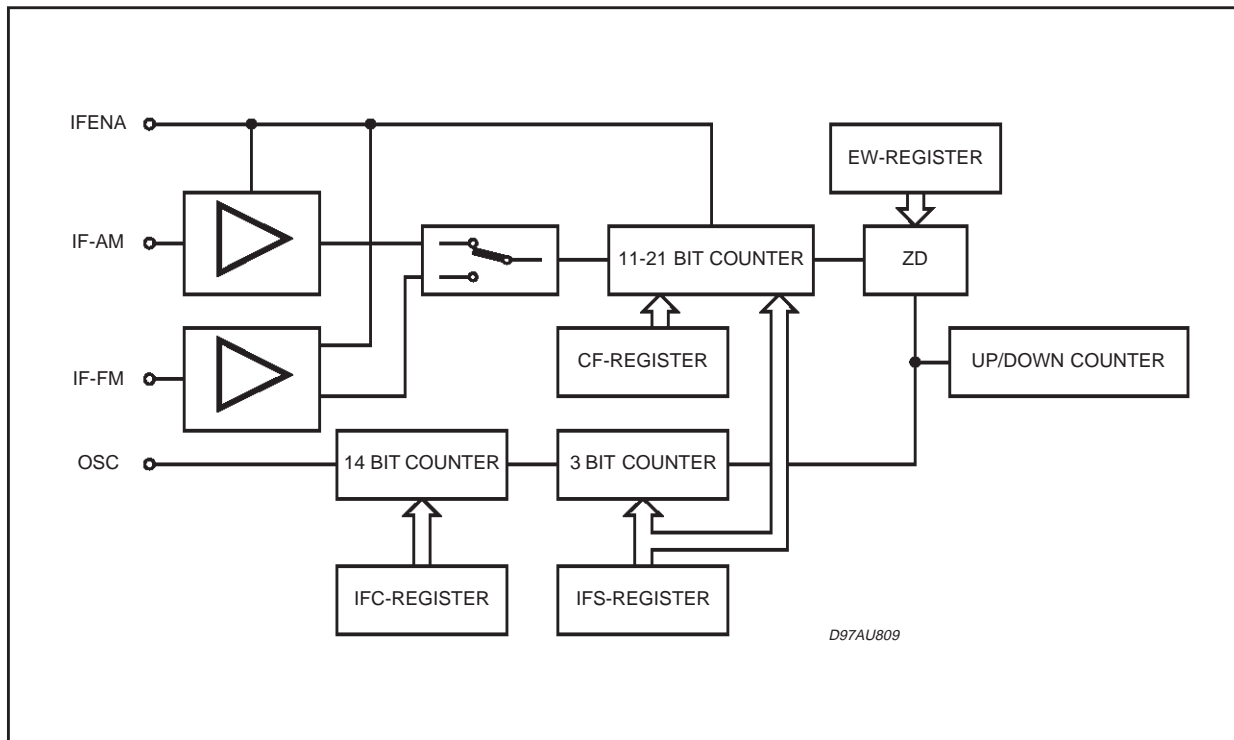

The interface protocol comprises:

- a subaddress byte
- a sequence of data (N-bytes + acknowledge)
- a stop condition (P)
- a start condition (S)
- a chip address byte

**CONTROL REGISTER FUNCTION**

REGISTER NAME	FUNCTION
PC	Programmable Counter for VCO Frequency
RC	Reference Counter PLL
IRC	Reference Counter IF
IFCM	IF Counter Mode
EW	Frequency Error Window
IFENA	Enable IF Counter
CF	Center Frequency IF Counter
IFS	Sampling Time IF Counter
PM	Stby, FM, AM, AM swallow mode (PLL Mode)
D	Programmable Delay for Lock Detector
LPIN1/2	Loop Filter Input Select
A	Charge Pump High Current
B	Charge Pump Low Current
LDENA	Lock Detector Enable
CURRH	Set Current High

**Figure 6. IF Counter Block Diagram**

D97AU809

Figure 7. I<sup>2</sup>C Bus Timing Diagram

### 5.8 Frame Example

For addressing the PLL part:

for the TUNER part:

- ACK: Acknowledge
- S: Start
- P: Stop
- I: Page mode
- T2, T1, T0: used in test mode (for PLL only, for TUNER addressing they must be 0)
- A3, A2, A1, A0: Mode selection

## 5.9 TUNER SUBADDRESS

MSB				LSB				FUNCTION
X	X	X	I	A3	A2	A1	A0	
				0	0	0	0	STATUS
				0	0	0	1	FM STOP STATION/FM IF AGC
				0	0	1	0	FM SMETER SLIDER/ AM IF2 AMP
				0	0	1	1	AM AGC1/AM STOP STATION
				0	1	0	0	IFT1/IFT2
				0	1	0	1	FRONT END ADJUSTMENT
