

VI TELEFILTER**Filter specification****TFS 70 G - Page 1 / 3****Measurement condition**

Ambient temperature: 23 °C
 Input power level: 0 dBm
 Source impedance: 50 Ω and test adapter
 Load impedance: 50 Ω and test adapter

Characteristics**Remark:**

Reference level for the relative attenuation a_{rel} of the TFS 70 G is the minimum of the pass band attenuation a_{min} . The minimum of the pass band attenuation a_{min} is defined as the insertion loss a_e . The centre frequency f_0 is the arithmetic mean value of the upper and lower frequencies at the 3dB filter attenuation level relative to the insertion loss a_e . The nominal frequency f_N is fixed on 70,00 MHz without tolerance. The given values for the relative attenuation a_{rel} and for the group delay ripple have to be reached at the frequencies given below also if the centre frequency f_0 is shifted due to the temperature coefficient of frequency TC_f in the operating temperature range and due to a production tolerance for the centre frequency f_0 .

D a t a		typ. value		tolerance / limit	
Insertion loss (Reference level)	a_e			22	dB
Nominal frequency	f_N	-		70,0	MHz
