General Description

TriQuint's TGA2583 is an S-band MMIC amplifier fabricated on TriQuint's production 0.25um GaN on SiC process (TQGaN25). Covering 2.7-3.7GHz, the TGA2583 provides 10W of saturated output power and 33dB of small signal gain while achieving 54% power-added efficiency. Higher power can be achieved at the expense of PAE by increasing the drain voltage.

The TGA2583 is ideal for phase array S-band radars and can support both short pulse and CW conditions.

Both RF ports have integrated DC blocking capacitors and are fully matched to 50ohms.

Lead-free and RoHS compliant.

Assembly Notes

Component placement and adhesive attachment assembly notes:

- Vacuum pencils and/or vacuum collets are the preferred method of pick up.
- Air bridges must be avoided during placement.
- The force impact is critical during auto placement.
- Organic attachment (i.e. epoxy) can be used in low-power applications.
- Curing should be done in a convection oven; proper exhaust is a safety concern.

Reflow process assembly notes:

- Use AuSn (80/20) solder and limit exposure to temperatures above 300°C to 3-4 minutes, maximum.
- An alloy station or conveyor furnace with reducing atmosphere should be used.
- Do not use any kind of flux.
- Coefficient of thermal expansion matching is critical for long-term reliability.
- Devices must be stored in a dry nitrogen atmosphere.

Interconnect process assembly notes:

- Thermosonic ball bonding is the preferred interconnect technique.
- Force, time, and ultrasonic are critical parameters.
- Aluminum wire should not be used.
- Devices with small pad sizes should be bonded with 0.0007-inch wire.
