Functional Description

The TLE4966H is an integrated circuit double Hall-effect sensor designed specifically for highly accurate applications. Precise magnetic switching points and high temperature stability are achieved by active compensation circuits and chopper techniques on chip. The TLE4966H provides a speed signal at Q2 for every magnetic pole pair and a direction information at Q1. The direction output switches 1µs (min.) before the speed output.

Circuit Description

The chopped Double Hall Switch comprises two Hall probes, bias generator, compensation circuits, oscillator, and output transistors.

The bias generator provides currents for the Hall probes and the active circuits. Compensation circuits stabilize the temperature behavior and reduce technology variations.

The Active Error Compensation rejects offsets in signal stages and the influence of mechanical stress to the Hall probes caused by molding and soldering processes and other thermal stresses in the package. This chopper technique together with the threshold generator and the comparator ensures high accurate magnetic switching points.

Distance of Hall plates	d_{HALL}	-	1.45	-	mm	
Thermal Resistance ⁶⁾	R_{thJA}	-	100	-	K/W	

¹⁾ To operate the sensor at the max. switching frequency, the value of the magnetic signal amplitude must be 1.4 times higher than for static fields. This is due to the -3dB corner frequency of the low pass filter in the signal path.

²⁾ Systematic delay between magnetic threshold reached and output switching.

³⁾ Jitter is the unpredictable deviation of the output switching delay.

⁴⁾ B_{REP} is equivalent to the noise constant.

⁵⁾ Time from applying $V_S \geq 2.7V$ to the sensor until the output state is valid.

⁶⁾ Thermal resistance from junction to ambient.

e.g.: $V_S=12.0V$, $I_{S_typ}=5.5mA$, $V_{QSAT_typ}=0.3V$, $2 \cdot I_Q=10mA \Rightarrow$ Power Dissipation $P_{dis}=72.0mW$.

In $T_A = T_j - (R_{thJA} \cdot P_{dis}) = 175^\circ C - (100 K/W \cdot 0.072 W) \Rightarrow T_A = 167.8^\circ C$
