1 Overview

Features

- 16-bit serial peripheral interface for control and diagnosis
- Daisy Chain capability SPI also compatible with 8-bit SPI devices
- 2 CMOS compatible parallel input pins with Input Mapping functionality
- Cranking capability down to $V_S = 3.0\text{ V}$ (supports LV124)
- Digital supply voltage range compatible with 3.3 V and 5 V microcontrollers
- Very low quiescent current (with usage of IDLE pin)
- Limp Home mode (with usage of IDLE and IN pins)
- Green Product (RoHS compliant)
- AEC Qualified

Description

The TLE75008-EMD is an eight channel low-side power switch in PG-SSOP-24-9 package providing embedded protective functions. It is specially designed to control relays and LEDs in automotive and industrial applications.

A serial peripheral interface (SPI) is utilized for control and diagnosis of the loads as well as of the device. For direct control and PWM there are two input pins available connected to two outputs by default. Additional or different outputs can be controlled by the same input pins (programmable via SPI).

PG-SSOP-24-9

Package	Marking
PG-SSOP-24-9	TLE75008EMD

Table 1 Product Summary

Parameter	Symbol	Values
Analog supply voltage	V_S	3.0 V ... 28 V
Digital supply voltage	V_{DD}	3.0 V ... 5.5 V
Minimum overvoltage protection	$V_{S(AZ)}$	42 V (see Chapter 8.5 for details)
Maximum on-state resistance at $T_J = 150\text{ °C}$	$R_{DS(ON)}$	2.2 Ω
Nominal load current ($T_A = 85\text{ °C}$, all channels)	$I_{L(NOM)}$	330 mA
Maximum Energy dissipation - repetitive	E_{AR}	10 mJ @ $I_{L(EAR)} = 220\text{ mA}$
Minimum Drain to Source clamping voltage	$V_{DS(CL)}$	42 V
Maximum overload switch OFF threshold	$I_{L(OVL0)}$	2.3 A
Maximum total quiescent current at $T_J \leq 85\text{ °C}$	I_{SLEEP}	5 μA
Maximum SPI clock frequency	f_{SCLK}	5 MHz

Applications

- Low-side switches for 12 V in automotive or industrial applications such as lighting, heating, motor driving, energy and power distribution
- Especially designed for driving relays, LEDs and motors.

Protective Functions

- Reverse battery protection on V_S without external components
- Short circuit to ground and battery protection
- Stable behavior at under voltage conditions (“Lower Supply Voltage Range for Extended Operation”)
- Over Current latch OFF
- Thermal shutdown latch OFF
- Overvoltage protection
- Loss of ground protection
- Loss of battery protection
- Electrostatic discharge (ESD) protection

Diagnostic Features

- Latched diagnostic information via SPI register
- Over Load detection at ON state
- Open Load detection at OFF state using Output Status Monitor function
- Output Status Monitor
- Input Status Monitor

Application Specific Functions

- Fail-safe activation via Input pins in Limp-Home Mode
- SPI with Daisy Chain capability
- Safe operation at low battery voltage (cranking)

Detailed Description

The TLE75008-EMD is an eight channel low-side switch providing embedded protective functions. The output stages incorporate eight low-side switches (typical $R_{DS(ON)}$ at $T_J = 25^\circ\text{C}$ is 1 Ω).

The 16-bit serial peripheral interface (SPI) is utilized to control and diagnose the device and the loads. The SPI interface provides daisy chain capability in order to assemble multiple devices (also devices with 8 bit SPI) in one SPI chain by using the same number of microcontroller pins.

This device is designed for low supply voltage operation, therefore being able to keep its state at low battery voltage ($V_S \geq 3.0$ V). The SPI functionality, including the possibility to program the device, is available only when the digital power supply is present (see [Chapter 6](#) for more details).

The TLE75008-EMD is equipped with two input pins that are connected to two outputs, making them controllable even when the digital supply voltage is not available. With the Input Mapping functionality it is possible to connect the input pins to different outputs, or assign more outputs to the same input pin. In this case more channels can be controlled with one signal applied to one input pin.

In Limp Home mode (Fail-Safe mode) the input pins are directly routed to channels 2 and 3. When IDLE pin is “low”, it is possible to activate the two channels using the input pins independently from the presence of the digital supply voltage.

The device provides diagnosis of the load via Open Load at OFF state (with `DIAG_OSM.OUTn` bits) and short circuit detection. For Open Load at OFF state detection, a internal current source I_{OL} can be activated via SPI.

Each output stage is protected against short circuit. In case of Overload, the affected channel switches OFF when the Overload Detection Current $I_{L(OVLn)}$ is reached and can be reactivated via SPI. In Limp Home mode operation, the channels connected to an input pin set to “high” restart automatically after Output Restart time $t_{RETRY(LH)}$ is elapsed. Temperature sensors are available for each channel to protect the device against Over Temperature.

The power transistors are built by N-channel power MOSFET . The inputs are ground referenced TTL compatible. The device is monolithically integrated in Smart Power Technology.

2 Block Diagram and Terms

2.1 Block Diagram

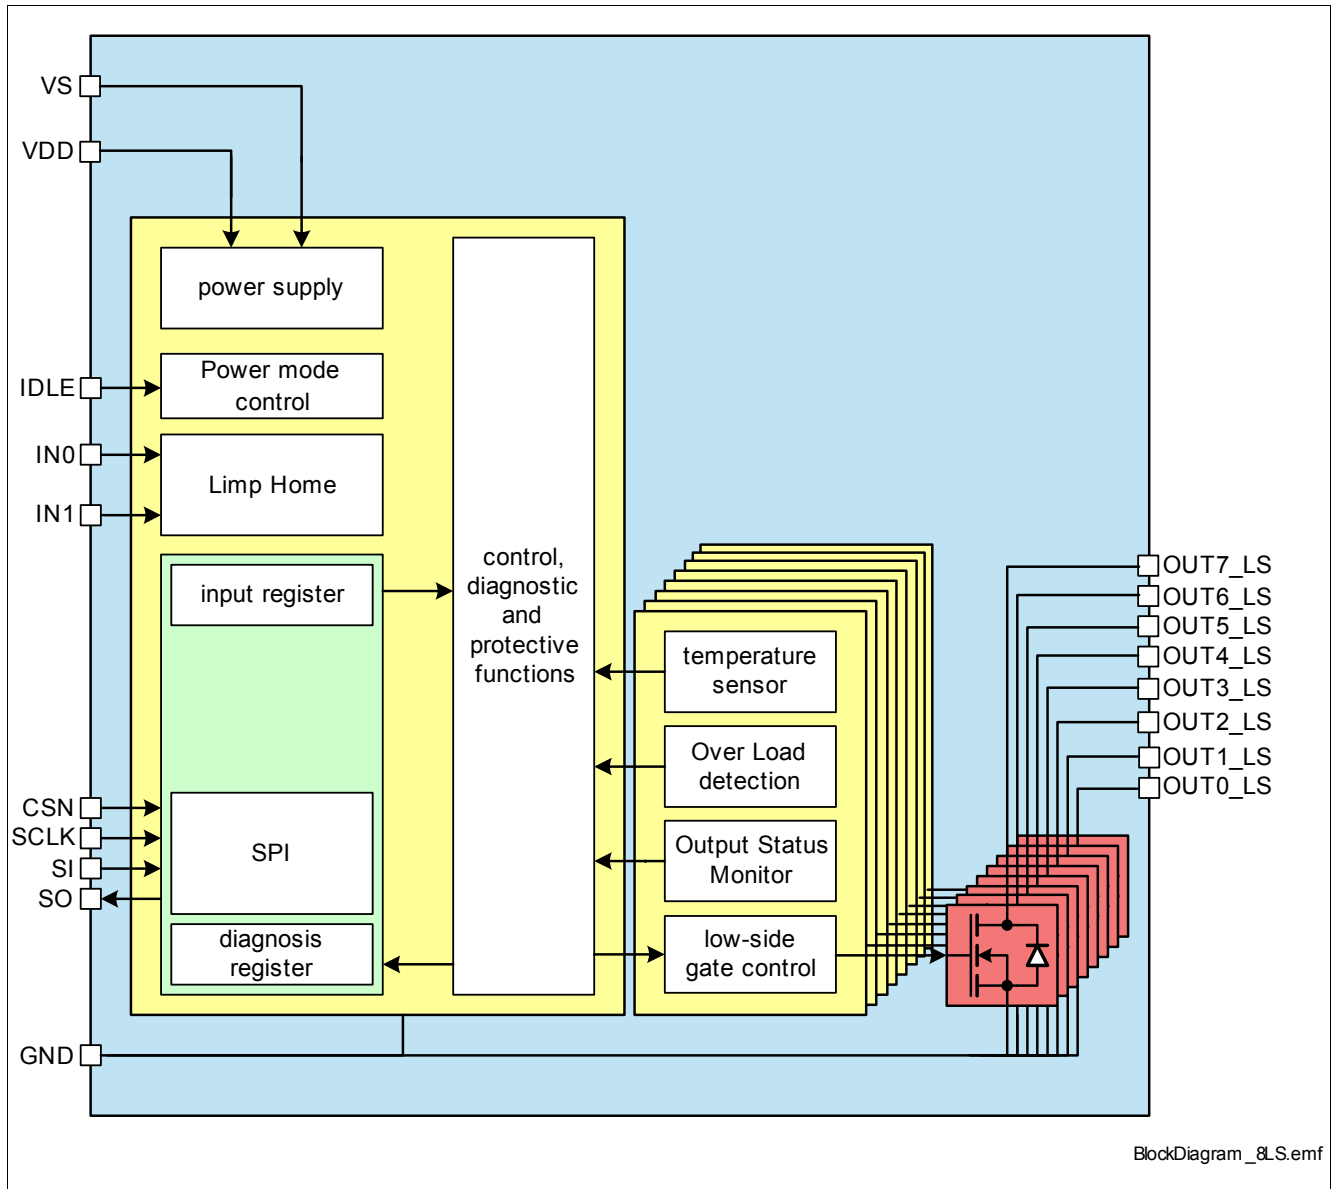

Figure 1 Block Diagram of TLE75008-EMD

2.2 Terms

Figure 2 shows all terms used in this data sheet, with associated convention for positive values.

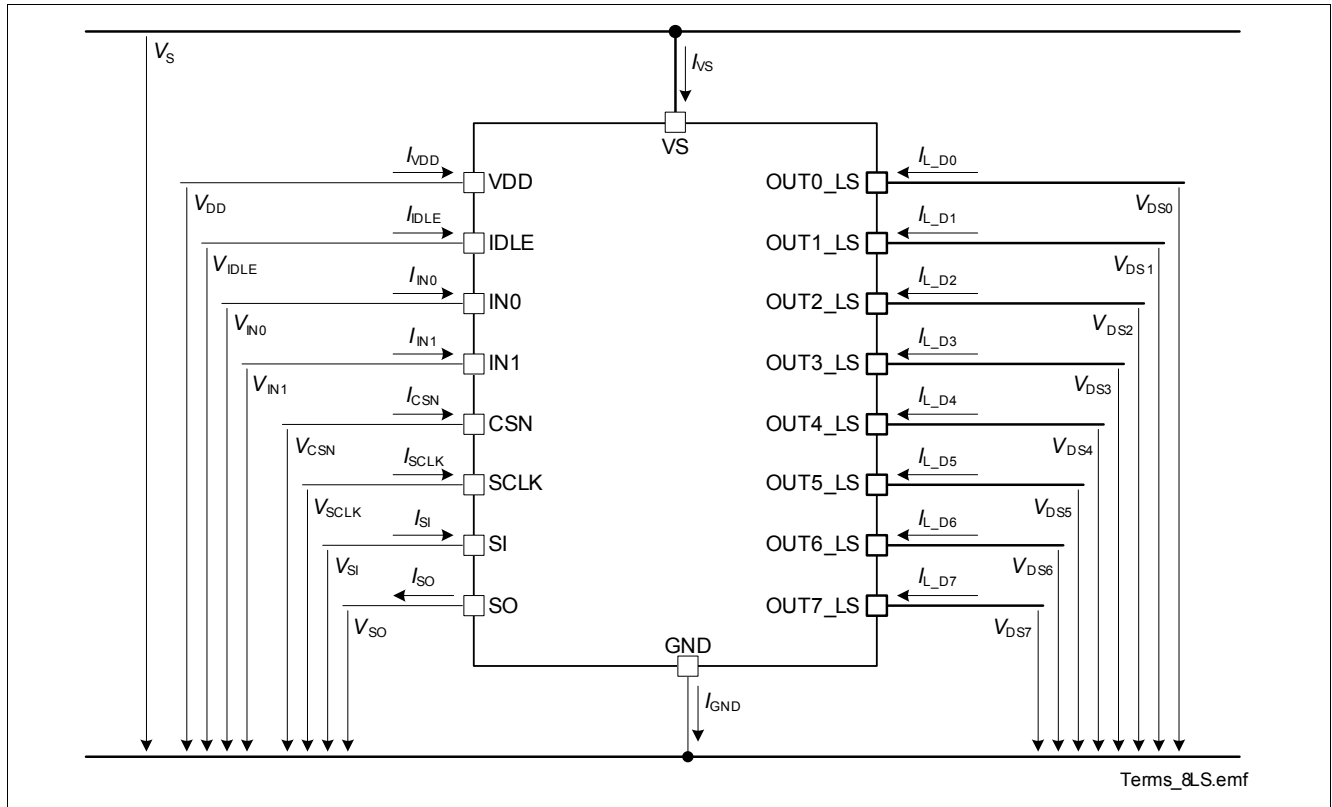

Figure 2 Voltage and Current definition

In all tables of electrical characteristics the channel related symbols without channel numbers are valid for each channel separately (e.g. V_{DS} specification is valid for $V_{DS0} \dots V_{DS7}$).

Furthermore, parameters relative to output current can be indicated without specifying whether the current is going into the Drain pin or going out of the Source pin, unless otherwise specified. For instance, nominal output current can be indicated in the following ways: $I_{L(NOM)}$ $I_{L_LS(NOM)}$ $I_{L_D(NOM)}$

All SPI registers bits are marked as follows: ADDR . PARAMETER (e.g. HWCR . RST) with the exception of the bits in the Diagnosis frames which are marked only with PARAMETER (e.g. UVRVS).

3 Pin Configuration

3.1 Pin Assignment

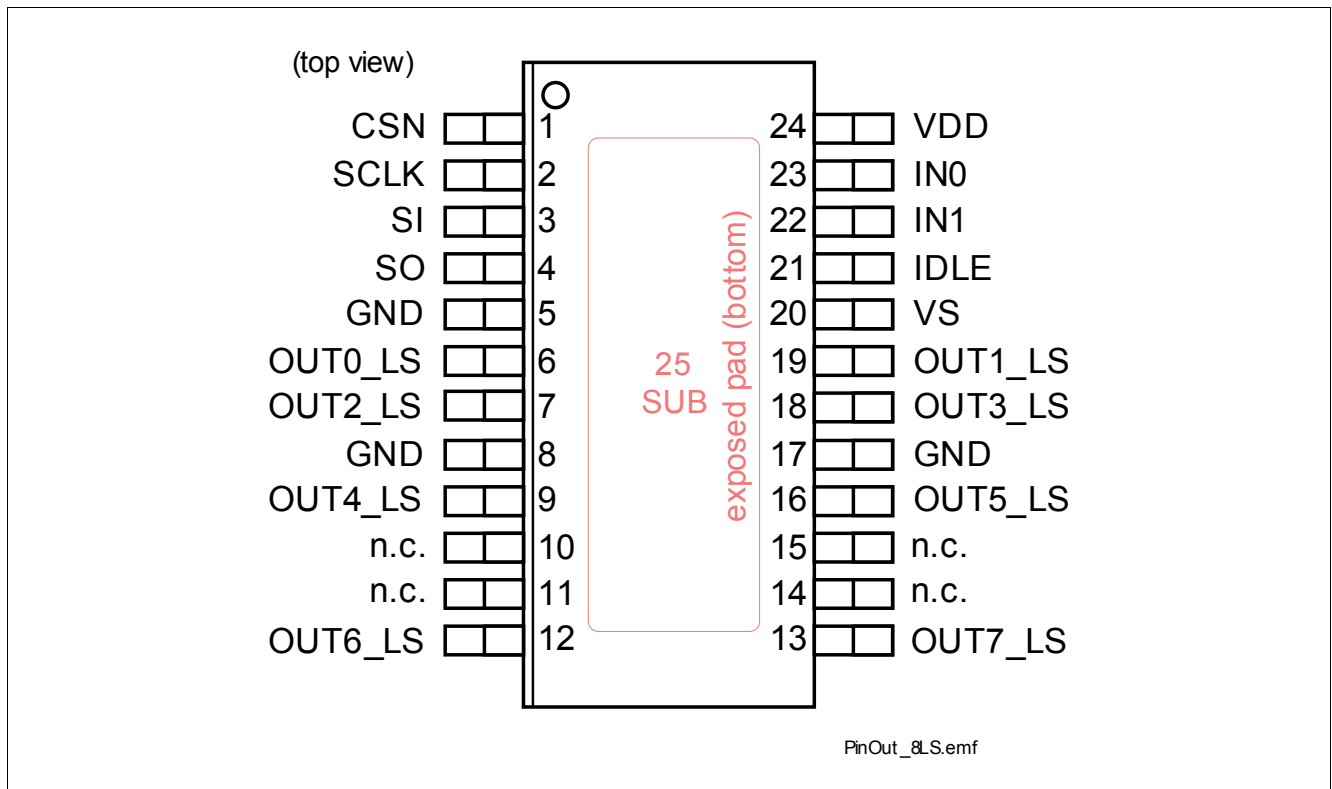

Figure 3 Pin Configuration TLE75008-EMD in PG-SSOP-24-9

3.2 Pin Definitions and Functions

Pin	Symbol	I/O	Function
Power Supply Pins			
20	VS	–	Analog supply V_S Positive supply voltage for power switches gate control (incl. protections)
24	VDD	–	Digital supply V_{DD} Supply voltage for SPI with support function to V_S
5, 8, 17	GND	–	Ground Ground connection
SPI Pins			
1	CSN	I	Chip Select “low” active, integrated pull-up to V_{DD}
2	SCLK	I	Serial Clock “high” active, integrated pull-down to ground
3	SI	I	Serial Input “high” active, integrated pull-down to ground
4	SO	O	Serial Output “Z” (tri-state) when CSN is “high”
Input and Stand-by Pins			
21	IDLE	I	Idle mode power mode control, “high” activates Idle mode, integrated pull-down to ground
23	IN0	I	Input pin 0 connected to channel 2 by default and in Limp Home mode, “high” active, integrated pull-down to ground
22	IN1	I	Input pin 1 connected to channel 3 by default and in Limp Home mode, “high” active, integrated pull-down to ground
Power Output Pins			
6	OUT0_LS	O	Drain of low-side power transistor (channel 0)
7	OUT2_LS	O	Drain of low-side power transistor (channel 2)
9	OUT4_LS	O	Drain of low-side power transistor (channel 4)
12	OUT6_LS	O	Drain of low-side power transistor (channel 6)
13	OUT7_LS	O	Drain of low-side power transistor (channel 7)
16	OUT5_LS	O	Drain of low-side power transistor (channel 5)
18	OUT3_LS	O	Drain of low-side power transistor (channel 3)
19	OUT1_LS	O	Drain of low-side power transistor (channel 1)
Not Connected pins / Cooling Tab			

Pin Configuration

Pin	Symbol	I/O	Function
10, 11, 14, 15	n.c.	–	Not Connected, internally not bonded
25	GND	–	Exposed pad It is recommended to connect it to PCB ground for cooling and EMC - not usable as electrical GND pin. Electrical ground must be provided by pins 5, 8 and 17.

4 General Product Characteristics

4.1 Absolute Maximum Ratings

Table 2 Absolute Maximum Ratings ¹⁾
 $T_J = -40\text{ °C to }+150\text{ °C}$

all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Supply Voltages							
Analog Supply voltage	V_S	-0.3	–	28	V	–	P_4.1.1
Digital Supply voltage	V_{DD}	-0.3	–	5.5	V	–	P_4.1.2
Supply voltage for load dump protection	$V_{S(LD)}$	–	–	42	V	²⁾	P_4.1.3
Supply voltage for short circuit protection (single pulse)	$V_{S(SC)}$	0	–	28	V	–	P_4.1.4
Reverse polarity voltage	$-V_{S(REV)}$	–	–	16	V	³⁾ $T_{J(0)} = 25\text{ °C}$ $t \leq 2\text{ min}$ See Chapter 11 for general setup. $R_L = 70\ \Omega$ on all channels	P_4.1.5
Current through VS pin	I_{VS}	-10	–	10	mA	$t \leq 2\text{ min}$	P_4.1.7
Current through VDD pin	I_{VDD}	-50	–	10	mA	$t \leq 2\text{ min}$	P_4.1.8
Power Stages							
Load current	$ I_L $	–	–	$I_{L(OVL0)}$	A	single channel	P_4.1.9
Voltage at power transistor	V_{DS}	-0.3	–	42	V	–	P_4.1.10
Maximum energy dissipation single pulse	E_{AS}	–	–	50	mJ	⁴⁾ $T_{J(0)} = 25\text{ °C}$ $I_{L(0)} = 2 \cdot I_{L(EAR)}$	P_4.1.13
Maximum energy dissipation single pulse	E_{AS}	–	–	25	mJ	⁴⁾ $T_{J(0)} = 150\text{ °C}$ $I_{L(0)} = 400\text{ mA}$	P_4.1.14
Maximum energy dissipation repetitive pulses - $I_{L(EAR)}$	E_{AR}	–	–	10	mJ	⁴⁾ $T_{J(0)} = 85\text{ °C}$ $I_{L(0)} = I_{L(EAR)}$ $2 \cdot 10^6\text{ cycles}$	P_4.1.15
IDLE pin							
Voltage at IDLE pin	V_{IDLE}	-0.3		5.5	V	–	P_4.1.23
Current through IDLE pin	I_{IDLE}	-0.75		0.75	mA	–	P_4.1.25
Current through IDLE pin	I_{IDLE}	-10.0		2.0	mA	$t \leq 2\text{ min.}$	P_4.1.26

Table 2 Absolute Maximum Ratings (cont'd)¹⁾
 $T_J = -40\text{ °C to }+150\text{ °C}$

all voltages with respect to ground, positive current flowing into pin (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Input Pins							
Voltage at input pins	V_{IN}	-0.3		5.5	V	–	P_4.1.28
Current through input pins	I_{IN}	-0.75		0.75	mA	–	P_4.1.30
Current through input pins	I_{IN}	-10.0		2.0	mA	$t \leq 2\text{ min.}$	P_4.1.31
SPI Pins							
Voltage at chip select pin	V_{CSN}	-0.3		5.5	V	–	P_4.1.33
Current through chip select pin	I_{CSN}	-0.75		0.75	mA	–	P_4.1.34
Current through chip select pin	I_{CSN}	-10.0		2.0	mA	$t \leq 2\text{ min.}$	P_4.1.35
Voltage at serial clock pin	V_{SCLK}	-0.3		5.5	V		P_4.1.37
Current through serial clock pin	I_{SCLK}	-0.75		0.75	mA	–	P_4.1.38
Current through serial clock pin	I_{SCLK}	-10.0		2.0	mA	$t \leq 2\text{ min.}$	P_4.1.39
Voltage at serial input pin	V_{SI}	-0.3		5.5	V		P_4.1.41
Current through serial input pin	I_{SI}	-0.75		0.75	mA	–	P_4.1.42
Current through serial input pin	I_{SI}	-10.0		2.0	mA	$t \leq 2\text{ min.}$	P_4.1.43
Voltage at serial output pin SO	V_{SO}	-0.3		$V_{DD}+0.3$	V		P_4.1.58
Current through serial output pin SO	I_{SO}	-0.75		0.75	mA		P_4.1.45
Current through serial output pin SO	I_{SO}	-2.0		10.0	mA	$t \leq 2\text{ min.}$	P_4.1.46
Temperatures							
Junction Temperature	T_J	-40	–	150	°C	–	P_4.1.48
Storage Temperature	T_{stg}	-55	–	150	°C	–	P_4.1.49
ESD Susceptibility							
ESD Susceptibility HBM OUT pins vs. V_S or GND	V_{ESD}	-4	–	4	kV	⁵⁾ HBM	P_4.1.50
ESD Susceptibility HBM other pins	V_{ESD}	-2	–	2	kV	⁵⁾ HBM	P_4.1.51
ESD Susceptibility CDM Pin 1, 12, 13, 24 (corner pins)	V_{ESD}	-750	–	750	V	⁶⁾ CDM	P_4.1.52
ESD Susceptibility CDM	V_{ESD}	-500	–	500	V	⁶⁾ CDM	P_4.1.54

1) Not subject to production test, specified by design.

 2) For a duration of $t_{on} = 400\text{ ms}$; $t_{on}/t_{off} = 10\%$; limited to 100 pulses

 3) Device is mounted on a FR4 2s2p board according to Jedec JESD51-2,-5,-7 at natural convection; the Product (Chip+Package) was simulated on a 76.2 * 114.3 * 1.5 mm board with 2 inner copper layers (2 * 70 μm Cu, 2 * 35 μm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.

 4) Pulse shape represents inductive switch off: $I_L(t) = I_L(0) \times (1 - t / t_{pulse})$; $0 < t < t_{pulse}$

 5) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS001 (1.5k Ω , 100 pF)

6) ESD susceptibility, Charged Device Model "CDM" ESDA STM5.3.1 or ANSI/ESD S.5.3.1

Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

4.2 Functional Range

Table 3 Functional range

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Supply Voltage Range for Normal Operation	$V_{S(NOR)}$	7	–	18	V	–	P_4.2.1
Upper Supply Voltage Range for Extended Operation	$V_{S(EXT,UP)}$	18	–	28	V	Parameter deviation possible	P_4.2.2
Lower Supply Voltage Range for Extended Operation	$V_{S(EXT,LOW)}$	3	–	7	V	Parameter deviation possible	P_4.2.3
Junction Temperature	T_J	-40	–	150	°C	–	P_4.2.4
Logic supply voltage	V_{DD}	3	–	5.5	V	–	P_4.2.5

Note: Within the functional or operating range, the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics table.

4.3 Thermal Resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to www.jedec.org.

Table 4 Thermal Resistance

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
Junction to Soldering Point	R_{thJSP}	–	5	7	K/W	¹⁾ measured to exposed pad (pin 25)	P_4.3.1
Junction to Ambient	R_{thJA}	–	32	–	K/W	¹⁾²⁾	P_4.3.3

- 1) not subject to production test, specified by design
- 2) Specified R_{thJA} value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2s2p board; the Product (Chip+Package) was simulated on a 76.2 * 114.3 * 1.5 mm board with 2 inner copper layers (2 * 70 μ m Cu, 2 * 35 μ m Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.

5 Control Pins

The device has three pins (IN0, IN1 and IDLE) to control directly the device without using SPI.

5.1 Input pins

TLE75008-EMD has two input pins available. Each input pin is connected by default to one channel (IN0 to channel 2, IN1 to channel 3). Input Mapping Registers **MAPIN0** and **MAPIN1** can be programmed to connect additional or different channels to each input pin, as shown in **Figure 9**. The signals driving the channels are an OR combination between **OUT** register status, IN0 and IN1 (according to Input Mapping registers status).

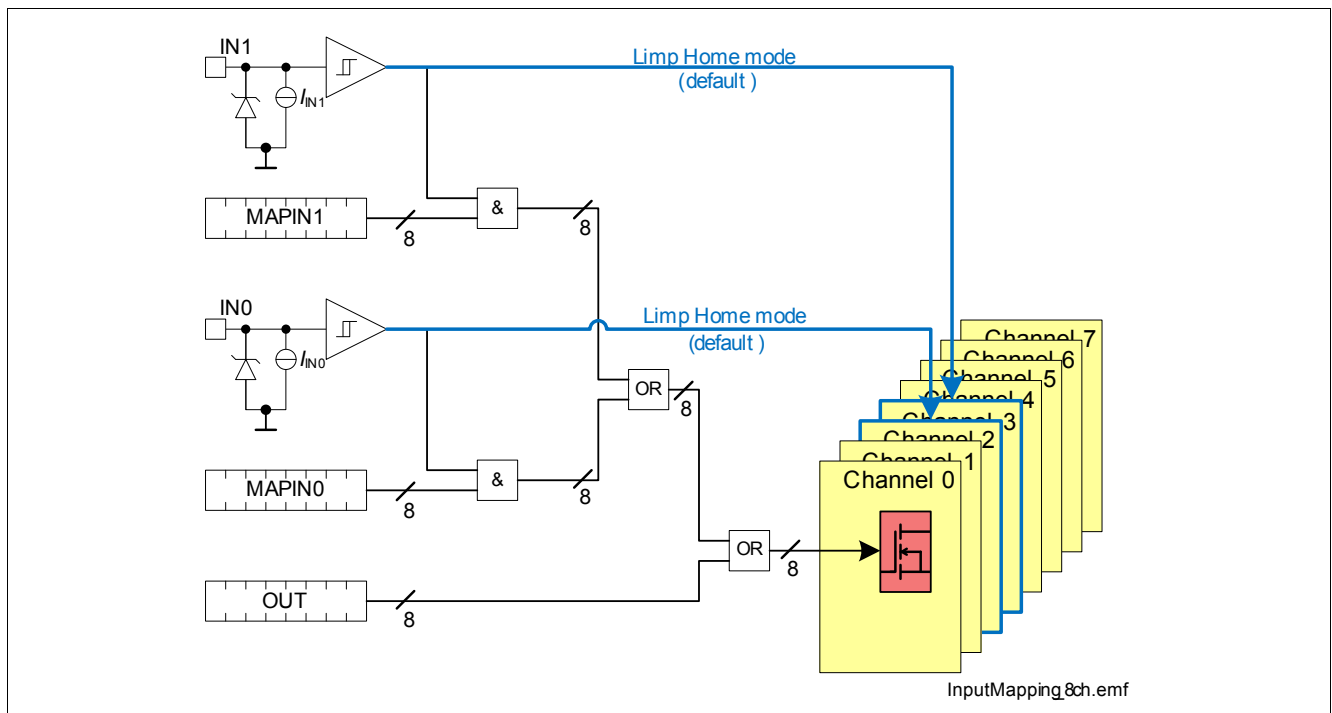

Figure 9 Input Mapping

The logic level of the input pins can be monitored via the Input Status Monitor Register (**INST**). The Input Status Monitor is operative also when TLE75008-EMD is in Limp Home mode. If one of the Input pins is set to “high” and the IDLE pin is set to “low”, the device switches into Limp Home mode and activates the channel mapped by default to the input pins. See **Chapter 6.1.5** for further details.

5.2 IDLE pin

The IDLE pin is used to bring the device into Sleep mode operation when is set to “low” and all input pins are set to “low”. When IDLE pin is set to “low” while one of the input pins is set to “high” the device enters Limp Home mode. To ensure a proper mode transition, IDLE pin must be set for at least $t_{IDLE2SLEEP}$ (P_6.3.54, transition from “high” to “low”) or $t_{SLEEP2IDLE}$ (P_6.3.53, transition from “low” to “high”).

Setting the IDLE pin to “low” has the following consequences:

- All registers in the SPI are reset to default values
- V_{DD} and V_S Undervoltage detection circuits are disabled to decrease current consumption (if both inputs are set to “low”)
- No SPI communication is allowed (SO pin remains in high impedance state also when CSN pin is set to “low”) if both input pins are set to “low”

5.3 Electrical Characteristics Control Pins

Table 5 Electrical Characteristics: Control Pins

$V_{DD} = 3\text{ V to }5.5\text{ V}$, $V_S = 7\text{ V to }18\text{ V}$, $T_J = -40\text{ °C to }+150\text{ °C}$ (unless otherwise specified)

Typical values: $V_{DD} = 5\text{ V}$, $V_S = 13.5\text{ V}$, $T_J = 25\text{ °C}$

Parameter	Symbol	Values			Unit	Note / Test Condition	Number
		Min.	Typ.	Max.			
IDLE pin							
L-input level	$V_{IDLE(L)}$	0		0.8	V	–	P_5.3.1
H-input level	$V_{IDLE(H)}$	2.0		5.5	V	–	P_5.3.2
L-input current	$I_{IDLE(L)}$	5	12	20	μA	$V_{IDLE} = 0.8\text{ V}$	P_5.3.3
H-input current	$I_{IDLE(H)}$	14	28	45	μA	$V_{IDLE} = 2.0\text{ V}$	P_5.3.4
Input Pins							
L-input level	$V_{IN(L)}$	0		0.8	V	–	P_5.3.5
H-input level	$V_{IN(H)}$	2.0		5.5	V	–	P_5.3.6
L-input current	$I_{IN(L)}$	5	12	20	μA	$V_{IN} = 0.8\text{ V}$	P_5.3.7
H-input current	$I_{IN(H)}$	14	28	45	μA	$V_{IN} = 2.0\text{ V}$	P_5.3.8

6 Power Supply

The TLE75008-EMD is supplied by two supply voltages:

- V_S (analog supply voltage used also for the logic)
- V_{DD} (digital supply voltage)

The V_S supply line is connected to a battery feed and used, in combination with V_{DD} supply, for the driving circuitry of the power stages. In situations where V_S voltage drops below V_{DD} voltage (for instance during cranking events down to 3.0 V), an increased current consumption may be observed at VDD pin.

V_S and V_{DD} supply voltages have an undervoltage detection circuit, which prevents the activation of the associated function in case the measured voltage is below the undervoltage threshold. More in detail:

- An undervoltage on both V_S and V_{DD} supply voltages prevents the activation of the power stages and any SPI communication (the SPI registers are reset)
- An undervoltage on V_{DD} supply prevents any SPI communication. SPI read/write registers are reset to default values.
- An undervoltage on V_S supply forces the TLE75008-EMD to drain all needed current for the low-side switches and for the logic from V_{DD} supply.

Figure 10 shows a basic concept drawing of the interaction between supply pins VS and VDD, the output stage drivers and SO supply line.

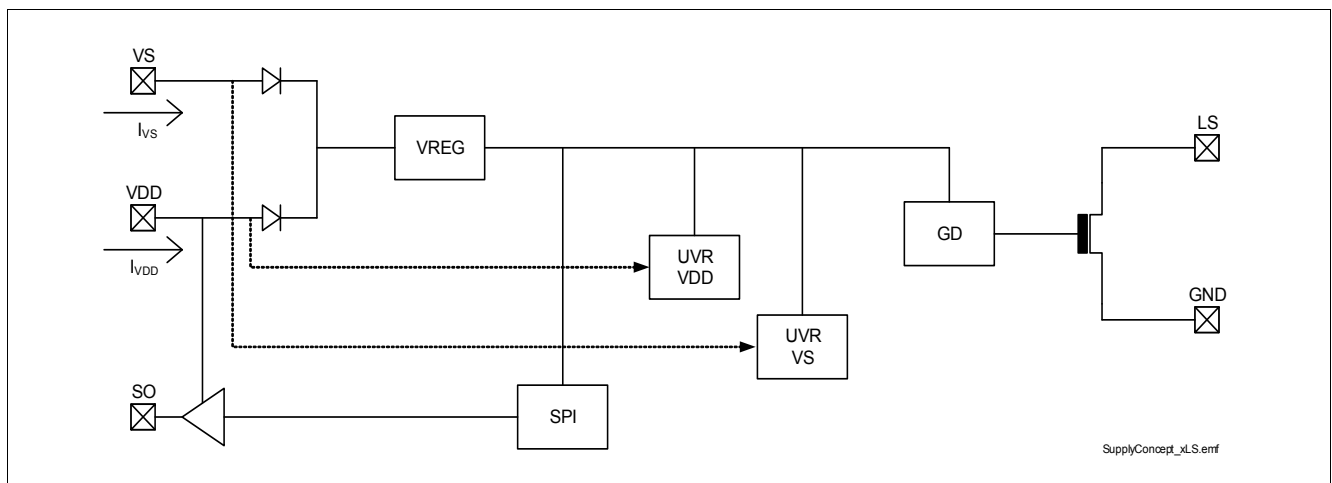

Figure 10 TLE75008-EMD Internal Power Supply concept

When $3.0\text{ V} \leq V_S \leq V_{DD} - V_{SDIFF}$ TLE75008-EMD operates in “Cranking Operative Range” (COR). In this condition the current consumption from VDD pin increases while it decreases from VS pin where the total current consumption remains within the specified limits. **Figure 11** shows the voltage levels at VS pin where the device goes in and out of COR. During the transition to and from COR operative region, I_{VS} and I_{VDD} change between values defined for normal operation and for COR operation. The sum of both current remains within limits specified in “Overall current consumption” section (see **Table 8**).

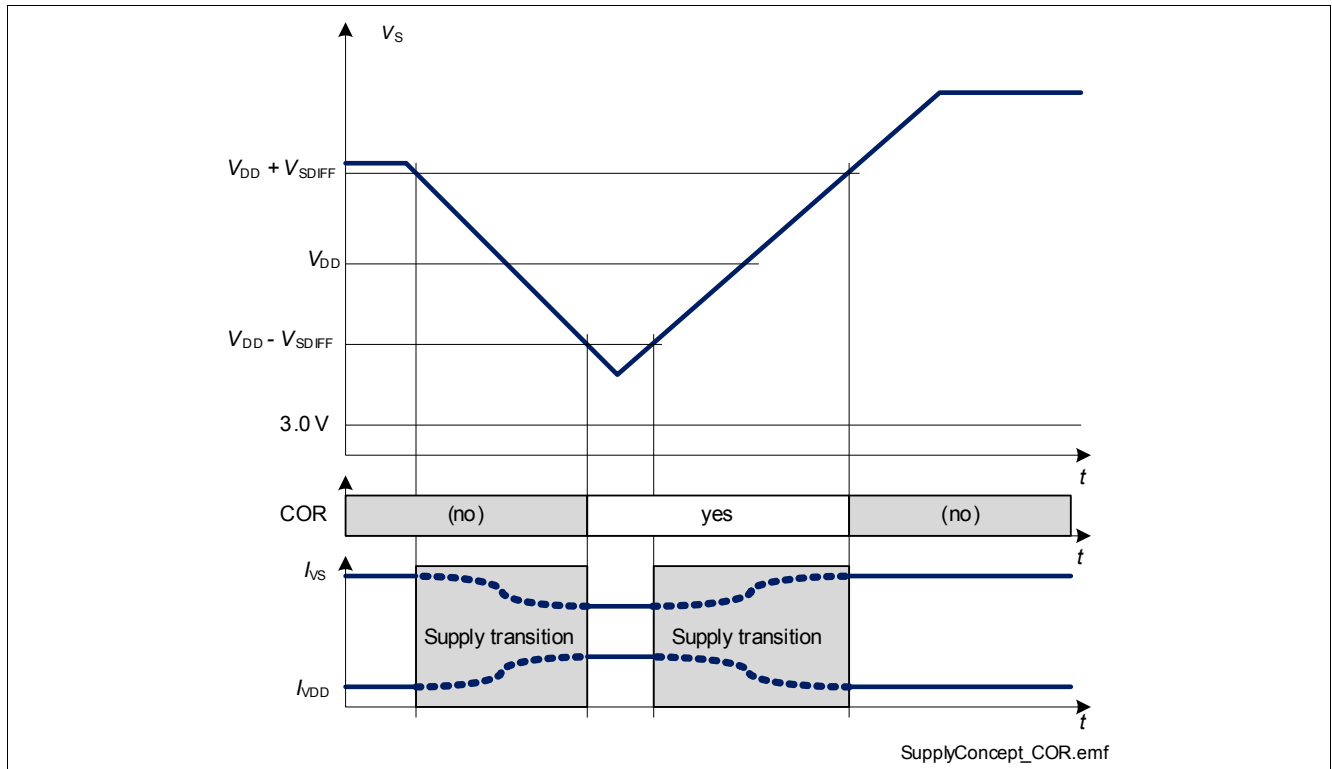

Figure 11 “Cranking Operative Range”

Furthermore, when $V_{S(UV)} \leq V_S \leq V_{S(OP)}$ it may be not possible to switch ON a channel that was previously OFF. All channels that are already ON keep their state unless they are switched OFF via SPI or via INn pins. An overview of channel behavior according to different V_S and V_{DD} supply voltages is shown in [Table 6](#) (the table is valid after a successful power-up, see [Chapter 6.1.1](#) for more details).

Table 6 Device capability as function of V_S and V_{DD}

	$V_{DD} \leq V_{DD(UV)}$ ($V_{DD(UV)} = P_6.3.25$)	$V_{DD} = V_{DD(LOP)}$ ($V_{DD(LOP)} = P_6.3.24$)	$V_{DD} > V_{DD(LOP)}$

 1) undervoltage condition on V_S must be considered - see [Chapter 6.2.1](#) for more details

6.1 Operation Modes

TLE75008-EMD has the following operation modes:

- Sleep mode
- Idle mode
- Active mode
- Limp Home mode

The transition between operation modes is determined according to following levels and states:

- logic level at IDLE pin
- logic level at INn pins
- **OUT . OUTn** bits state
- **HWCR . ACT** bit state

The state diagram including the possible transitions is shown in **Figure 12**. The behaviour of TLE75008-EMD as well as some parameters may change in dependence from the operation mode of the device. Furthermore, due to the undervoltage detection circuitry which monitors V_S and V_{DD} supply voltages, some changes within the same operation mode can be seen accordingly.

The operation mode of the TLE75008-EMD can be observed by:

- status of output channels
- status of SPI registers
- current consumption at VDD pin (I_{VDD})
- current consumption at VS pin (I_{VS})

The default operation mode to switch ON the loads is Active mode. If the device is not in Active mode and a request to switch ON one or more outputs comes (via SPI or via Input pins), it will switch into Active or Limp Home mode, according to IDLE pin status. Due to the time needed for such transitions, output turn-on time t_{ON} will be extended due to the mode transition latency.

Figure 12 Operation Mode state diagram

Table 7 shows the correlation between device operation modes, V_S and V_{DD} supply voltages, and state of the most important functions (channels operativity, SPI communication and SPI registers).

Table 7 Device function in relation to operation modes, V_S and V_{DD} voltages

1) see [Chapter 6.2.1](#) for more details

2) see [Chapter 6.1.5](#) for a detailed overview

6.1.1 Power-up

The Power-up condition is satisfied when one of the supply voltages (V_S or V_{DD}) is applied to the device and the INn or IDLE pins are set to “high”. If V_S is above the threshold $V_{S(OP)}$ or if V_{DD} is above the threshold $V_{DD(LOP)}$ the internal power-on signal is set.

6.1.2 Sleep mode

When TLE75008-EMD is in Sleep mode, all outputs are OFF and the SPI registers are reset, independently from the supply voltages. The current consumption is minimum. See parameters $I_{VDD(SLEEP)}$ and $I_{VS(SLEEP)}$, or parameter I_{SLEEP} for the whole device.

6.1.3 Idle mode

In Idle mode, the current consumption of the device can reach the limits given by parameters $I_{VDD(IDLE)}$ and $I_{VS(IDLE)}$, or by parameter I_{IDLE} for the whole device. The internal voltage regulator is working. Diagnosis functions are not available. The output channels are switched OFF, independently from the supply voltages. When V_{DD} is available, the SPI registers are working and SPI communication is possible. In Idle mode the **ERRn** bits are not cleared for functional safety reasons.

6.1.4 Active mode

Active mode is the normal operation mode of TLE75008-EMD when no Limp Home condition is set and it is necessary to drive some or all loads. Voltage levels of V_{DD} and V_S influence the behavior as described at the beginning of [Chapter 6](#). Device current consumption is specified with $I_{VDD(ACTIVE)}$ and $I_{VS(ACTIVE)}$ (I_{ACTIVE} for the

whole device). The device enters Active mode when IDLE pin is set to “high” and one of the input pins is set to “high” or one **OUT . OUTn** bit is set to “1”. If **HWCR . ACT** is set to “0”, the device returns to Idle mode as soon as all inputs pins are set to “low” and **OUT . OUTn** bits are set to “0”. If **HWCR . ACT** is set to “1”, the device remains in Active mode independently of the status of input pins and **OUT . OUTn** bits. An undervoltage condition on V_{DD} supply brings the device into Idle mode, if all input pins are set to “low”. Even if the registers **MAPIN0** and **MAPIN1** are both set to “00_H” but one of the input pins INn is set to “high”, the device goes into Active mode.

6.1.5 Limp Home mode

TLE75008-EMD enters Limp Home mode when IDLE pin is “low” and one of the input pins is set to “high”, switching ON the channel connected to it. SPI communication is possible but only in read-only mode (SPI registers can be read but cannot be written). More in detail:

- **UVRVS** and **LOPVDD** are set to “1”
- **MODE** bits are set to “01_B” (Limp Home mode)
- **TER** bit is set to “1” on the first SPI command after entering Limp Home mode. Afterwards it works normally
- **OLOFF** bits is set to “0”
- **ERRn** bits work normally
- **DIAG_OSM . OUTn** bits can be read and work normally
- All other registers are set to their default value and cannot be programmed as long as the device is in Limp Home mode

See **Table 6** for a detailed overview of supply voltage conditions required to switch ON channels 2 and 3 during Limp Home. All other channels are OFF.

A transmission of SPI commands during transition from Active to Limp Home mode or Limp Home to Active mode may result in undefined SPI responses.

6.1.6 Definition of Power Supply modes transition times

The channel turn-ON time is as defined by parameter t_{ON} when TLE75008-EMD is in Active mode or in Limp Home mode. In all other cases, it is necessary to add the transition time required to reach one of the two aforementioned Power Supply modes (as shown in **Figure 13**).

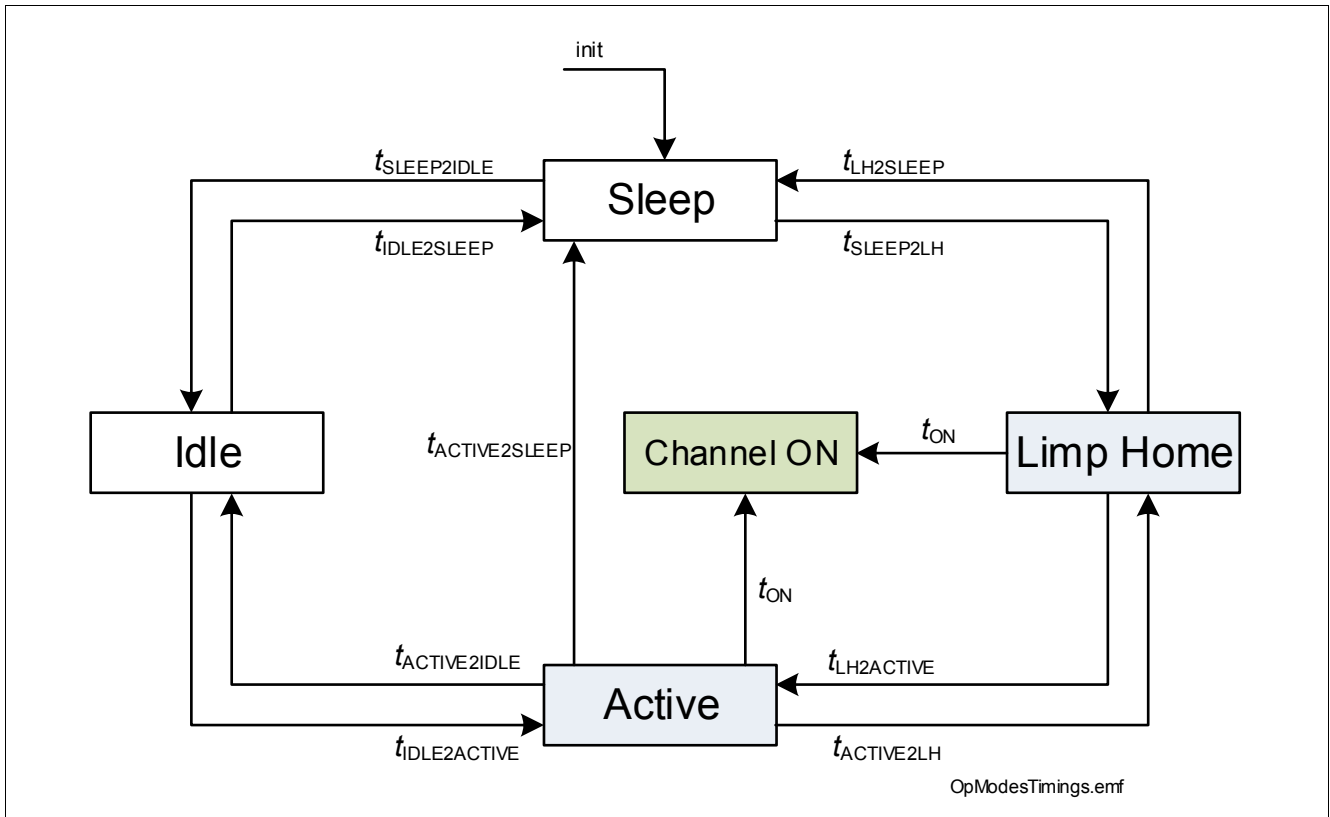

Figure 13 Transition Time diagram

6.2 Reset condition

One of the following 3 conditions resets the SPI registers to the default value:

- V_{DD} is not present or below the undervoltage threshold $V_{DD(UV)}$
- IDLE pin is set to “low”
- a reset command (**HWCR.RST** set to “1”) is executed
 - **ERRn** bits are not cleared by a reset command (for functional safety)
 - **UVRVS** and **LOPVDD** bits are cleared by a reset command

In particular, all channels are switched OFF (if there are no input pin set to “high”) and the Input Mapping configuration is reset.

6.2.1 Undervoltage on V_S

Between $V_{S(UV)}$ and $V_{S(OP)}$ the undervoltage mechanism is triggered. If the device is operative and the supply voltage drops below the undervoltage threshold $V_{S(UV)}$, the logic set the bit **UVRVS** to “1”. As soon as the supply voltage V_S is above the minimum voltage operative threshold $V_{S(OP)}$, the bit **UVRVS** is set to “0” after the first Standard Diagnosis readout. Undervoltage condition on V_S influences the status of the channels, as described in **Table 6**. **Figure 14** sketches the undervoltage behavior.

Figure 14 V_S Undervoltage Behavior

6.2.2 Low Operating Power on V_{DD}

When V_{DD} supply voltage is in the range indicated by $V_{DD(LOP)}$, the bit **LOPVDD** is set to "1". As soon as $V_{DD} > V_{DD(LOP)}$ the bit **LOPVDD** is set to "0" after the first Standard Diagnosis readout.

If V_{DD} supply voltage is not present, a voltage applied to pins CSN or SO can supply the internal logic (not recommended in normal operation due to internal design limitations).

6.3 Electrical Characteristics Power Supply

Table 8 Electrical Characteristics Power Supply

$V_{DD} = 3\text{ V to }5.5\text{ V}$, $V_S = 7\text{ V to }18\text{ V}$, $T_J = -40\text{ °C to }+150\text{ °C}$, all voltages with respect to ground, positive currents flowing as described in [Figure 2](#) (unless otherwise specified)

7 Power Stages

The TLE75008-EMD is an eight channels low-side relay switch. The power stages are built by N-channel lateral power MOSFET transistors.

7.1 Output ON-state resistance

The ON-state resistance $R_{DS(ON)}$ depends on the supply voltage as well as the junction temperature T_J .

7.1.1 Switching Resistive Loads

When switching resistive loads the following switching times and slew rates can be considered.

Figure 15 Switching a Resistive Load

7.1.2 Inductive Output Clamp

When switching off inductive loads, the voltage across the power switch rises to $V_{DS(CL)}$ potential, because the inductance intends to continue driving the current. The voltage clamping is necessary to prevent device destruction.

Figure 16 shows a concept drawing of the implementation. Nevertheless, the maximum allowed load inductance is limited. The clamping structure protects the device in all operative modes (Sleep, Idle, Active, Limp Home).

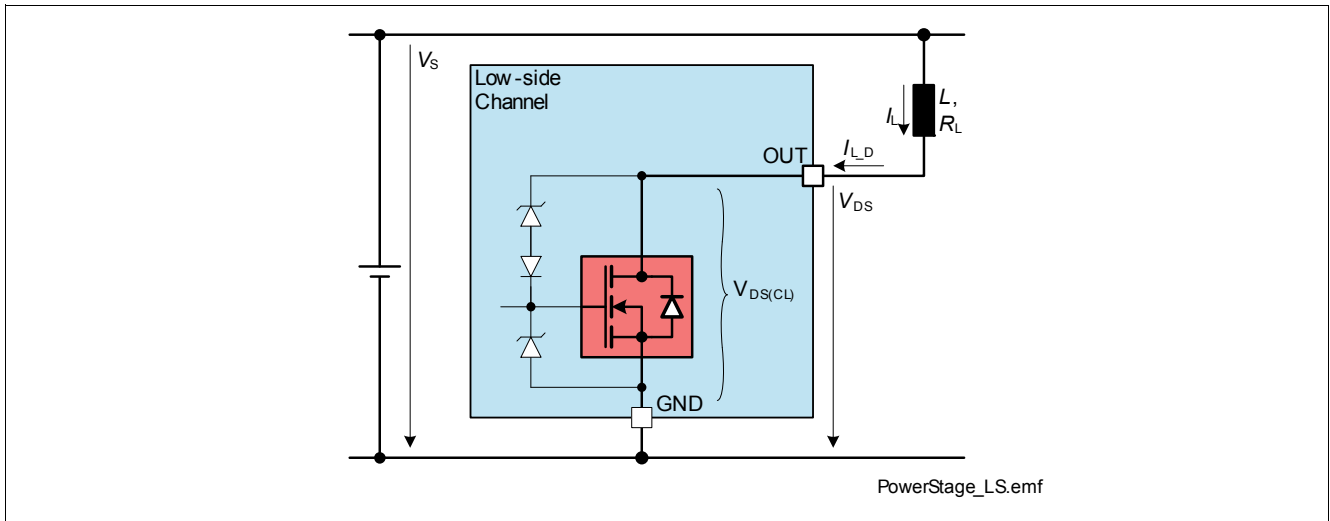

Figure 16 Output Clamp concept

7.1.3 Maximum Load Inductance

During demagnetization of inductive loads, energy has to be dissipated in the TLE75008-EMD. Equation (7.1) shows how to calculate the energy for low-side switches:

$$E = V_{DS(CL)} \cdot \left[\frac{V_S - V_{DS(CL)}}{R_L} \cdot \ln \left(1 - \frac{R_L \cdot I_L}{V_S - V_{DS(CL)}} \right) + I_L \right] \cdot \frac{L}{R_L} \quad (7.1)$$

The maximum energy, which is converted into heat, is limited by the thermal design of the component. The E_{AR} value provided in Table 2 assumes that all channels can dissipate the same energy when the inductances connected to the outputs are demagnetized at the same time.

7.2 Switching Channels in parallel

In case of appearance of a short circuit with channels in parallel, it may happen that the two channels switch OFF asynchronously, therefore bringing an additional thermal stress to the channel that switches OFF last. In order to avoid this condition, it is possible to parametrize in the SPI registers the parallel operation of two neighbour channels (bits `HWCR.PAR`). When operating in this mode, the fastest channel to react to an Over Load or Over Temperature condition will deactivate also the other. The inductive energy that two channels can handle once set in parallel is lower than twice the single channel energy (see P_7.6.11). It is possible to synchronize the following couples of channels:

- channel 0 and channel 2 → `HWCR.PAR (0)` set to “1”
- channel 1 and channel 3 → `HWCR.PAR (1)` set to “1”
- channel 4 and channel 6 → `HWCR.PAR (2)` set to “1”
- channel 5 and channel 7 → `HWCR.PAR (3)` set to “1”

The synchronization bits influence only how the channels react to Over Load or Over Temperature conditions. Synchronized channels have to be switched ON and OFF individually by the micro-controller.

7.3 Electrical Characteristics Power Stages

Table 9 Electrical Characteristics: Power Stage
 $V_{DD} = 3\text{ V to }5.5\text{ V}$, $V_S = 7\text{ V to }18\text{ V}$, $T_J = -40\text{ °C to }+150\text{ °C}$ (unless otherwise specified)

Typical values: $V_{DD} = 5\text{ V}$, $V_S = 13.5\text{ V}$, $T_J = 25\text{ °C}$

1) Not subject to production test - specified by design

 2) If one channel has $I_{L(NOM),max}$ applied, the remaining channels must be underloaded accordingly so that $T_J < 150\text{ °C}$

 3) $I_{L(NOM),max}$ can reach $I_{L(OVL1),min}$

8 Protection Functions

8.1 Over Load Protection

The TLE75008-EMD is protected in case of over load or short circuit of the load. There are two over load current thresholds (see **Figure 17**):

- $I_{L(OVL0)}$ between channel switch ON and t_{OVLIN}
- $I_{L(OVL1)}$ after t_{OVLIN}

Every time the channel is switched OFF for a time longer than $2 * t_{SYNC}$ the over load current threshold is set back to $I_{L(OVL0)}$.

Figure 17 Over Load current thresholds

In case the load current is higher than $I_{L(OVL0)}$ or $I_{L(OVL1)}$, after time $t_{OFF(OVL)}$ the over loaded channel is switched OFF and the according diagnosis bit **ERRn** is set. The channel can be switched ON after clearing the protection latch by setting the corresponding **HWCR_OCL.OUTn** bit to "1". This bit is set back to "0" internally after de-latching the channel. Please refer to **Figure 18** for details.

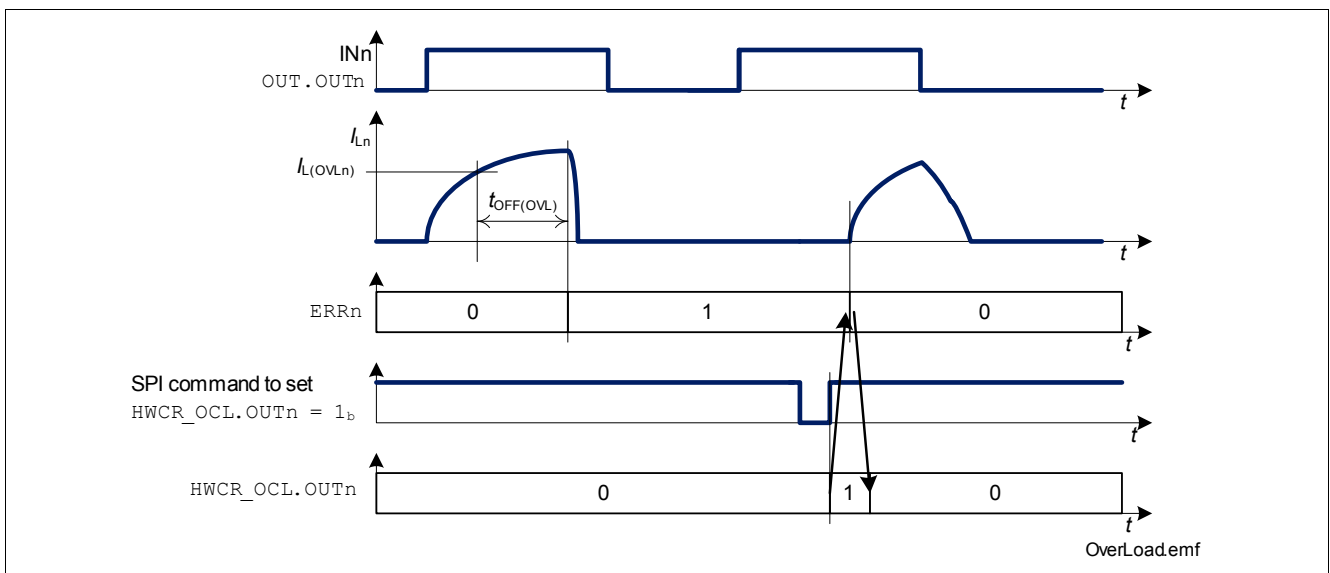

Figure 18 Latch OFF at Over Load

8.2 Over Temperature Protection

A temperature sensor is integrated for each channel, causing an overheated channel to switch OFF to prevent destruction. The according diagnosis bit **ERRn** is set (combined with Over Load protection). The channel can be

switched ON after clearing the protection latch by setting the corresponding `HWCR_OCL.OUTn` bit to “1”. This bit is set back to “0” internally after de-latching the channel.

8.3 Over Temperature and Over Load Protection in Limp Home mode

When TLE75008-EMD is in Limp Home mode, channels 2 and 3 can be switched ON using the input pins. In case of Over Load, Short Circuit or Over Temperature the channels switch OFF. If the input pins remain “high”, the channels restart with the following timings:

- 10 ms (first 8 retries)
- 20 ms (following 8 retries)
- 40 ms (following 8 retries)
- 80 ms (as long as the input pin remains “high” and the error is still present)

If at any time the input pin is set to “low” for longer than $2 \cdot t_{\text{SYNC}}$, the restart timer is reset. At the next channel activation while in Limp Home mode the timer starts from 10 ms again. See [Figure 19](#) for details. Over Load current thresholds behave as described in [Chapter 8.1](#).

Figure 19 Restart timer in Limp Home mode

8.4 Reverse Polarity Protection

In Reverse Polarity (also known as Reverse Battery) condition, power dissipation is caused by the intrinsic body diode of each DMOS channel. Each ESD diode of the logic and supply pins contributes to total power dissipation. The reverse current through the channels has to be limited by the connected loads. The current through digital power supply V_{DD} and input pins has to be limited as well (please refer to the Absolute Maximum Ratings listed on [Chapter 4.1](#)).

Note: No protection mechanism like temperature protection or current limitation is active during reverse polarity.

8.5 Over Voltage Protection

In the case of supply voltages between $V_{\text{S(SC)}}$ and $V_{\text{S(LD)}}$ the output transistors are still operational and follow the input pins or the `OUT` register.

In addition to the output clamp for inductive loads as described in [Chapter 7.1.2](#), there is a clamp mechanism available for over voltage protection for the logic and all channels, monitoring the voltage between VS and GND pins ($V_{\text{S(AZ)}}$).

8.6 Electrical Characteristics Protection

Table 10 Electrical Characteristics Protection
 $V_{DD} = 3\text{ V to }5.5\text{ V}$, $V_S = 7\text{ V to }18\text{ V}$, $T_J = -40\text{ °C to }+150\text{ °C}$ (unless otherwise specified)

9 Diagnosis

The SPI of TLE75008-EMD provides diagnosis information about the device and the load status. Each channel diagnosis information is independent from other channels. An error condition on one channel has no influence on the diagnostic of other channels in the device (unless configured to work in parallel, see [Chapter 7.2](#) for more details).

9.1 Over Load and Over Temperature

When either an Over Load or an Over Temperature occurs on one channel, the diagnosis bit **ERRn** is set accordingly. As described in [Chapter 8.1](#) and [Chapter 8.2](#), the channel latches OFF and must be reactivated setting corresponding **HWCR_OCL.OUTn** bit to "1".

9.2 Output Status Monitor

The device compares each channel V_{DS} with $V_{DS(OL)}$ and sets the corresponding **DIAG_OSM.OUTn** bits accordingly. The bits are updated every time **DIAG_OSM** register is read.

- $V_{DS} < V_{DS(OL)} \rightarrow \text{DIAG_OSM.OUTn} = "1"$

A diagnosis current I_{OL} in parallel to the power switch can be enabled by programming the **DIAG_IOL.OUTn** bit, which can be used for Open Load at OFF detection. Each channel has its dedicated diagnosis current source. If the diagnosis current I_{OL} is enabled or if the channel changes state (ON \rightarrow OFF or OFF \rightarrow ON) it is necessary to wait a time t_{OSM} for a reliable diagnosis. Enabling I_{OL} current sources increases the current consumption of the device. Even if an Open Load is detected, the channel is not latched OFF.

See [Figure 20](#) for a timing overview (the values of **DIAG_IOL.OUTn** refer to a channel in normal operation properly connected to the load).

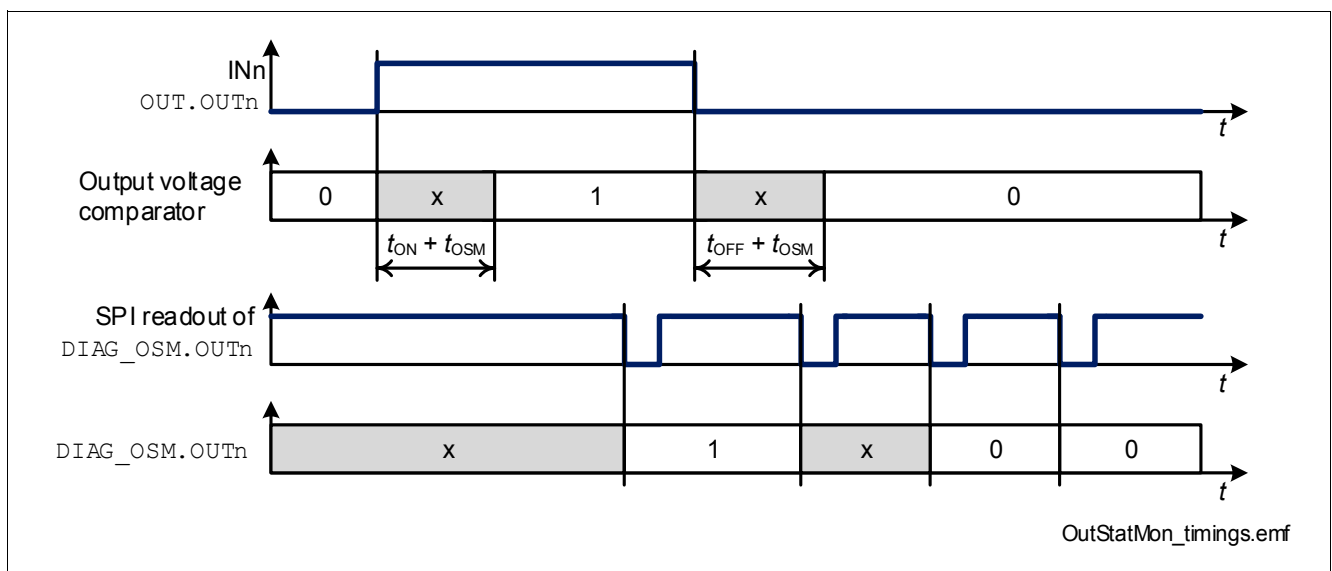

Figure 20 Output Status Monitor timing

Output Status Monitor diagnostic is available when $V_S = V_{S(NOR)}$ and $V_{DD} \geq V_{DD(UV)}$.

Due to the fact that Output Status Monitor checks the voltage level at the outputs in real time, for Open Load in OFF diagnostic it is necessary to synchronize the reading of **DIAG_OSM** register with the OFF state of the channels.

[Figure 21](#) shows how Output Status Monitor is implemented at concept level.

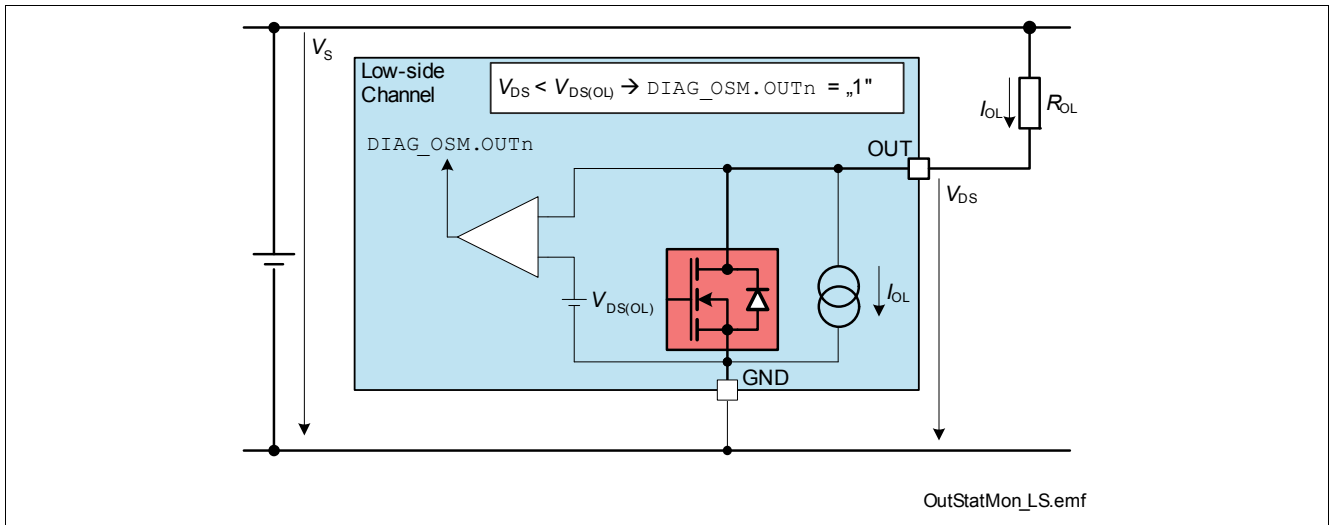

Figure 21 Output Status Monitor - concept

In Standard Diagnosis the bit **OLOFF** represents the OR combination of all **DIAG_OSM.OUTn** bits for all channels in OFF state which have the corresponding current source I_{OL} activated.

9.3 Electrical Characteristics Diagnosis

Table 11 Electrical Characteristics Diagnosis

$V_{DD} = 3\text{ V to }5.5\text{ V}$, $V_S = 7\text{ V to }18\text{ V}$, $T_J = -40\text{ °C to }+150\text{ °C}$ (unless otherwise specified)

Typical values: $V_{DD} = 5\text{ V}$, $V_S = 13.5\text{ V}$, $T_J = 25\text{ °C}$

10 Serial Peripheral Interface (SPI)

The serial peripheral interface (SPI) is a full duplex synchronous serial slave interface, which uses four lines: SO, SI, SCLK and CSN. Data is transferred by the lines SI and SO at the rate given by SCLK. The falling edge of CSN indicates the beginning of an access. Data is sampled in on line SI at the falling edge of SCLK and shifted out on line SO at the rising edge of SCLK. Each access must be terminated by a rising edge of CSN. A modulo 8/16 counter ensures that data is taken only when a multiple of 8 bit has been transferred after the first 16 bits. Otherwise a TER bit is asserted. In this way the interface provides daisy chain capability with 16 bit as well as with 8 bit SPI devices.

Figure 22 Serial Peripheral Interface

10.1 SPI Signal Description

CSN - Chip Select

The system microcontroller selects the TLE75008-EMD by means of the CSN pin. Whenever the pin is in "low" state, data transfer can take place. When CSN is in "high" state, any signals at the SCLK and SI pins are ignored and SO is forced into a high impedance state.

CSN "high" to "low" Transition

- The requested information is transferred into the shift register.
- SO changes from high impedance state to "high" or "low" state depending on the logic OR combination between the transmission error flag (TER) and the signal level at pin SI. This allows to detect a faulty transmission even in daisy chain configuration.
- If the device is in Sleep mode, SO pin remains in high impedance state and no SPI transmission occurs.

Figure 23 Combinatorial Logic for TER bit

CSN “low” to “high” Transition

- Command decoding is only done, when after the falling edge of CSN exactly a multiple (1, 2, 3, ...) of eight SCLK signals have been detected after the first 16 SCLK pulses. In case of faulty transmission, the transmission error bit (**TER**) is set and the command is ignored.
- Data from shift register is transferred into the addressed register.

SCLK - Serial Clock

This input pin clocks the internal shift register. The serial input (SI) transfers data into the shift register on the falling edge of SCLK while the serial output (SO) shifts diagnostic information out on the rising edge of the serial clock. It is essential that the SCLK pin is in “low” state whenever chip select CSN makes any transition, otherwise the command may be not accepted.

SI - Serial Input

Serial input data bits are shift-in at this pin, the most significant bit first. SI information is read on the falling edge of SCLK. The input data consists of two parts, control bits followed by data bits. Please refer to [Chapter 10.5](#) for further information.

SO Serial Output

Data is shifted out serially at this pin, the most significant bit first. SO is in high impedance state until the CSN pin goes to “low” state. New data appears at the SO pin following the rising edge of SCLK.

Please refer to [Chapter 10.5](#) for further information.

10.2 Daisy Chain Capability

The SPI of TLE75008-EMD provides daisy chain capability. In this configuration several devices are activated by the same CSN signal MCSN. The SI line of one device is connected with the SO line of another device (see [Figure 24](#)), in order to build a chain. The end of the chain is connected to the output and input of the master device, MO and MI respectively. The master device provides the master clock MCLK which is connected to the SCLK line of each device in the chain.

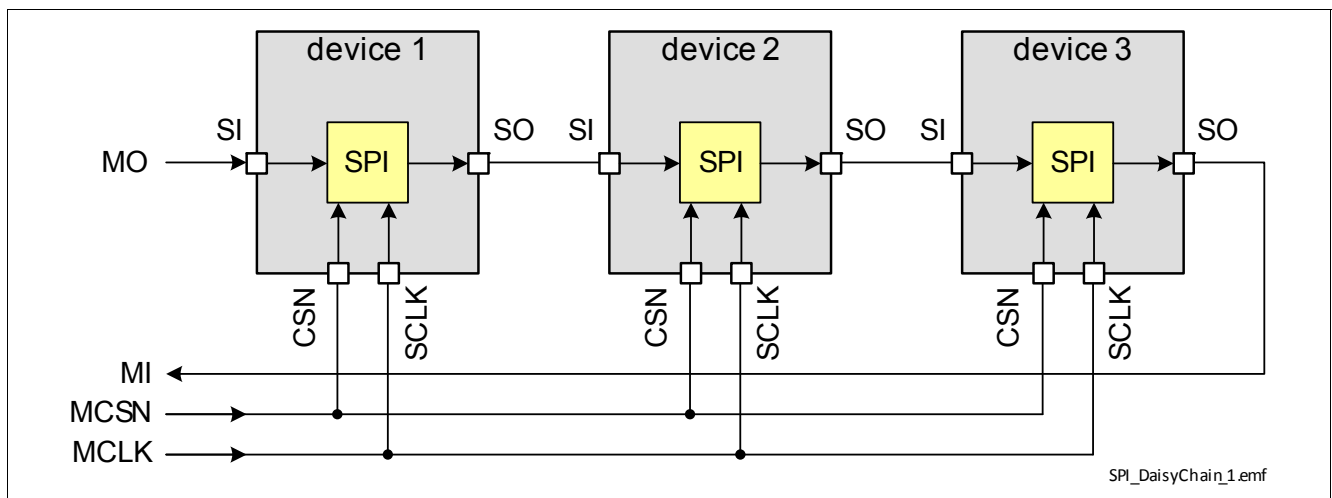

Figure 24 Daisy Chain Configuration

In the SPI block of each device, there is one shift register where each bit from SI line is shifted in each SCLK. The bit shifted out occurs at the SO pin. After sixteen SCLK cycles, the data transfer for one device is finished. In single chip configuration, the CSN line must turn “high” to make the device acknowledge the transferred data. In daisy

Serial Peripheral Interface (SPI)

chain configuration, the data shifted out at device 1 has been shifted in to device 2. When using three devices in daisy chain, several multiples of 8 bits have to be shifted through the devices (depending on how many devices with 8 bit SPI and how many with 16 bit SPI). After that, the MCSN line must turn “high” (see [Figure 25](#)).

Figure 25 Data Transfer in Daisy Chain Configuration

10.5 SPI Protocol

The relationship between SI and SO content during SPI communication is shown in **Figure 27**. SI line represents the frame sent from the μC and SO line is the answer provided by TLE75008-EMD.

Figure 27 Relationship between SI and SO during SPI communication

The SPI protocol provides the answer to a command frame only with the next transmission triggered by the μC . Although the biggest majority of commands and frames implemented in TLE75008-EMD can be decoded without the knowledge of what happened before, it is advisable to consider what the μC sent in the previous transmission to decode TLE75008-EMD response frame completely.

More in detail, the sequence of commands to “read” and “write” the content of a register looks as follows:

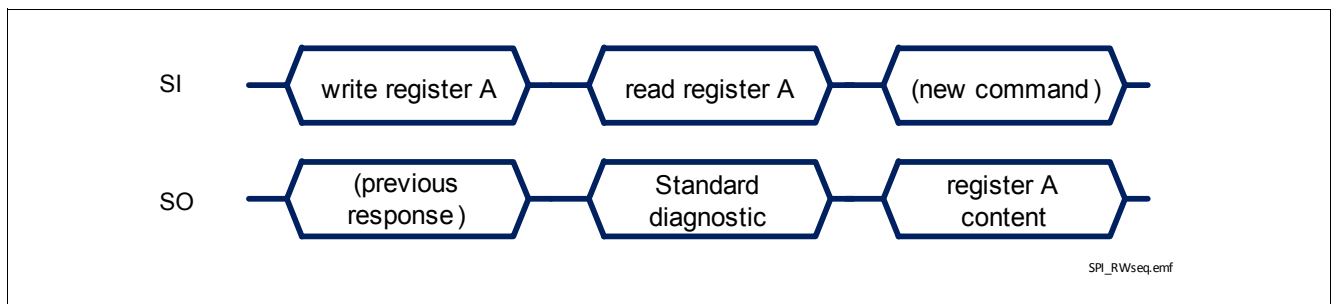

Figure 28 Register content sent back to μC

There are 3 special situations where the frame sent back to the μC is not related directly to the previous received frame:

- in case an error in transmission happened during the previous frame (for instance, the clock pulses were not multiple of 8 with a minimum of 16 bits), shown in **Figure 29**
- when TLE75008-EMD logic supply comes out of Power-On reset condition or after a Software Reset, as shown in **Figure 30**
- in case of command syntax errors
 - “write” command starting with “11” instead of “10”
 - “read” command starting with “00” instead of “01”
 - “read” or “write” commands on registers which are “reserved” or “not used”

Serial Peripheral Interface (SPI)

Figure 29 TLE75008-EMD response after a error in transmission

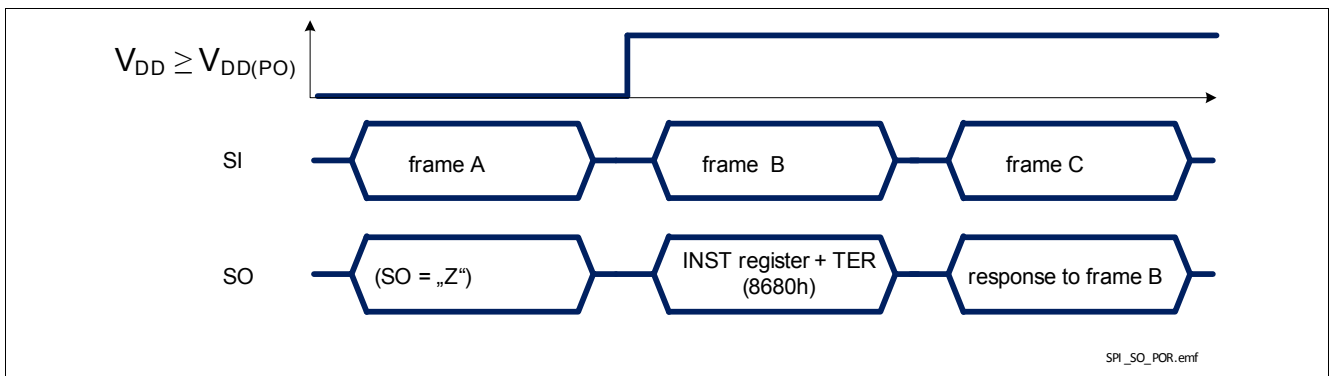

Figure 30 TLE75008-EMD response after coming out of Power-On reset at V_{DD}

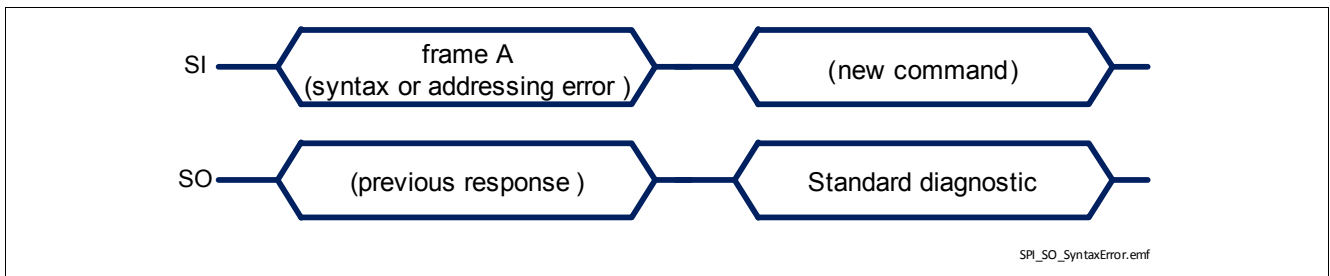

Figure 31 TLE75008-EMD response after a command syntax error

A summary of all possible SPI commands is presented in [Table 13](#), including the answer that TLE75008-EMD sends back at the next transmission.

Serial Peripheral Interface (SPI)

Table 13 SPI Command summary¹⁾

Requested Operation	Frame sent to SPIDER+ (SI pin)	Frame received from SPIDER+ (SO pin) with the next command
Read Standard Diagnosis	0xxxxxxxxxxxxxxxxx01 _B ("xxxxxxxxxxxxx _B " = don't care)	0ddddddddddddddd _B (Standard Diagnosis)
Write 8 bit register	10aaaaabbcccccccc _B where: "aaaa _B " = register address ADDR0 "bb _B " = register address ADDR1 "cccccccc _B " = new register content	0ddddddddddddddd _B (Standard Diagnosis)
Read 8 bit registers	01aaaaabbxxxxxx10 _B where: "aaaa _B " = register address ADDR0 "bb _B " = register address ADDR1 "xxxxxx _B " = don't care	10aaaaabbcccccccc _B where: "aaaa _B " = register address ADDR0 "bb _B " = register address ADDR1 "cccccccc _B " = register content

1) "a" = address bits for ADDR0 field, "b" = address bit for ADDR1 field, "c" = register content, "d" = diagnostic bit

10.6 SPI Registers Overview

10.6.1 Standard Diagnosis

Table 14 Standard Diagnosis

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Default
----	----	----	----	----	----	---	---	---	---	---	---	---	---	---	---	---------

0	UVR VS	LOP VDD	MODE	TER	0	OL OFF	ERR									7800 _H
---	-----------	------------	------	-----	---	-----------	-----	--	--	--	--	--	--	--	--	-------------------

Field	Bits	Type	Description
UVRVS	14	r	V_S Undervoltage Monitor 0 _B No undervoltage condition on V_S detected (see Chapter 6.2.1 for more details) 1 _B (default) There was at least one V_S Undervoltage condition since last Standard Diagnosis readout
LOPVDD	13	r	V_{DD} Lower Operating Range Monitor 0 _B V_{DD} is above $V_{DD(LOP)}$ 1 _B (default) There was at least one " $V_{DD} = V_{DD(LOP)}$ " condition since last Standard Diagnosis readout
MODE	12:11	r	Operative Mode Monitor 00 _B (reserved) 01 _B Limp Home Mode 10 _B Active Mode 11 _B (default) Idle Mode
TER	10	r	Transmission Error 0 _B Previous transmission was successful (modulo 16 + n*8 clocks received, where n = 0, 1, 2...) 1 _B (default) Previous transmission failed The first frame after a reset is TER set to "high" and the INST register. The second frame is the Standard Diagnosis with TER set to "low" (if there was no fail in the previous transmission).
OLOFF	8	r	Open Load in OFF Diagnosis 0 _B (default) All channels in OFF state (which have DIAG_IOL.OUTn bit set to "1") have $V_{DS} > V_{DS(OL)}$ 1 _B At least one channel in OFF state (with DIAG_IOL.OUTn bit set to "1") has $V_{DS} < V_{DS(OL)}$ Channels in ON state are not considered
ERR _n n = 7 to 0	n:0	r	Over Load / Over Temperature Diagnosis of channel n 0 _B (default) No failure detected 1 _B Over Temperature or Over Load

10.6.2 Register structure

The register banks the digital part have following structure:

Table 15 Register structure - all registers

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Default
----	----	----	----	----	----	---	---	---	---	---	---	---	---	---	---	---------

r = 0 w = 1	r = 1 w = 0	ADDR0	ADDR1	DATA	XXXX _H
----------------	----------------	-------	-------	------	-------------------

Table 16 summarizes the available registers with their addressing space and size

Table 16 Register addressing space

Register name	ADDR0	ADDR1	Size	Type	Purpose
OUT n = 7 to 0	0000 _B	00 _B	n	r/w	Power output control register bits <code>OUT.OUTn</code> 0 _B (default) Output is OFF 1 _B Output is ON
MAPIN0 n = 7 to 0	0001 _B	00 _B	n	r/w	Input Mapping (Input Pin 0) bits <code>MAPIN0.OUTn</code> 0 _B (default) The output is not connected to the input pin 1 _B The output is connected to the input pin Note: Channel 2 has the corresponding bit set to "1" by default
MAPIN1 n = 7 to 0	0001 _B	01 _B	n	r/w	Input Mapping (Input Pin 1) bits <code>MAPIN1.OUTn</code> 0 _B (default) The output is not connected to the input pin 1 _B The output is connected to the input pin Note: Channel 3 has the corresponding bit set to "1" by default
INST	0001 _B	10 _B	8	r	Input Status Monitor bit <code>TER</code> 0 _B Previous transmission was successful (modulo 16 + n*8 clocks received, where n = 0, 1, 2...) 1 _B (default) Previous transmission failed bits <code>INST.RES (6:2)</code> - reserved bits <code>INST.INn (1:0)</code> 0 _B (default) The input pin is set to "low" 1 _B The input pin is set to "high" First register transmitted after a reset of the logic

Serial Peripheral Interface (SPI)

Table 16 Register addressing space (cont'd)

Register name	ADDR0	ADDR1	Size	Type	Purpose
DIAG_IOL n = 7 to 0	0010 _B	00 _B	n	r/w	Open Load diagnostic current control bits DIAG_IOL.OUTn 0 _B (default) Diagnosis current not enabled 1 _B Diagnosis current enabled
DIAG_OSM n = 7 to 0	0010 _B	01 _B	n	r	Output Status Monitor bits DIAG_OSM.OUTn 0 _B (default) $V_{DS} > V_{DS(OL)}$ 1 _B $V_{DS} < V_{DS(OL)}$
HWCR	0011 _B	00 _B	8	r/w	Hardware Configuration Register bit HWCR.ACT (7) (Active Mode) 0 _B (default) Normal operation or device leaves Active Mode 1 _B Device enters Active Mode (see Chapter 6.1 for a description of the possible operative mode transitions) bit HWCR.RST (6) (Reset) 0 _B (default) Normal operation 1 _B Execute Reset command (self clearing) bits HWCR.PAR (3:0) (channels operating in parallel) 0 _B (default) Normal operation 1 _B two neighbour channels have Over Load and Over Temperature synchronized (see Chapter 7.2 for more details) bits 5:4 - reserved (default: 0 _B)
HWCR_OCL n = 7 to 0	0011 _B	01 _B	n	w	Output Clear Latch bits HWCR_OCL.OUTn 0 _B (default) Normal operation 1 _B Clear the error latch for the selected output

10.6.3 Register summary

All registers with addresses not mentioned in [Table 17](#) have to be considered as “reserved”. “Read” operations performed on those registers return the Standard Diagnosis. The column “Default” indicates the content of the register (8 bits) after a reset.

Table 17 Addressable registers

15	14	13-10	9	8	7	6	5	4	3	2	1	0	Default
r = 0 w = 1	r = 1 w = 0	0000	00										00 _H
r = 0 w = 1	r = 1 w = 0	0001	00										04 _H

Table 17 Addressable registers

15	14	13-10	9	8	7	6	5	4	3	2	1	0	Default
r = 0 w = 1	r = 1 w = 0	0001	01	MAPIN1.OUTn								08 _H	
0	1	0001	10	TER (reserved)						INST.INn		00 _H	
r = 0 w = 1	r = 1 w = 0	0010	00	DIAG_IOL.OUTn								00 _H	
0	1	0010	01	DIAG_OSM.OUTn								00 _H	
r = 0 w = 1	r = 1 w = 0	0011	00	HWCR .ACT	HWCR .RST	(reserved)		HWCR.PAR			00 _H		
r = 0 w = 1	r = 1 w = 0	0011	01	HWCR_OCL.OUTn								00 _H	

10.6.4 SPI command quick list

A summary of the most used SPI commands (read and write operations on all registers) is shown in [Table 18](#)

Table 18 SPI command quick list

Register	“read” command”	“write” command	content written
OUT	4002 _H	80XX _H	XX _H = xxxxxxxx _B
MAPIN0	4402 _H	84XX _H	XX _H = xxxxxxxx _B
MAPIN1	4502 _H	85XX _H	XX _H = xxxxxxxx _B
INST	4602 _H	n.a. (read-only)	–
DIAG_IOL	4802 _H	88XX _H	XX _H = xxxxxxxx _B
DIAG_OSM	4902 _H	n.a. (read-only)	–
HWCR	4C02 _H	8CXX _H	XX _H = xxxxxxxx _B
HWCR_OCL	4D02 _H	8DXX _H	XX _H = xxxxxxxx _B

11 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

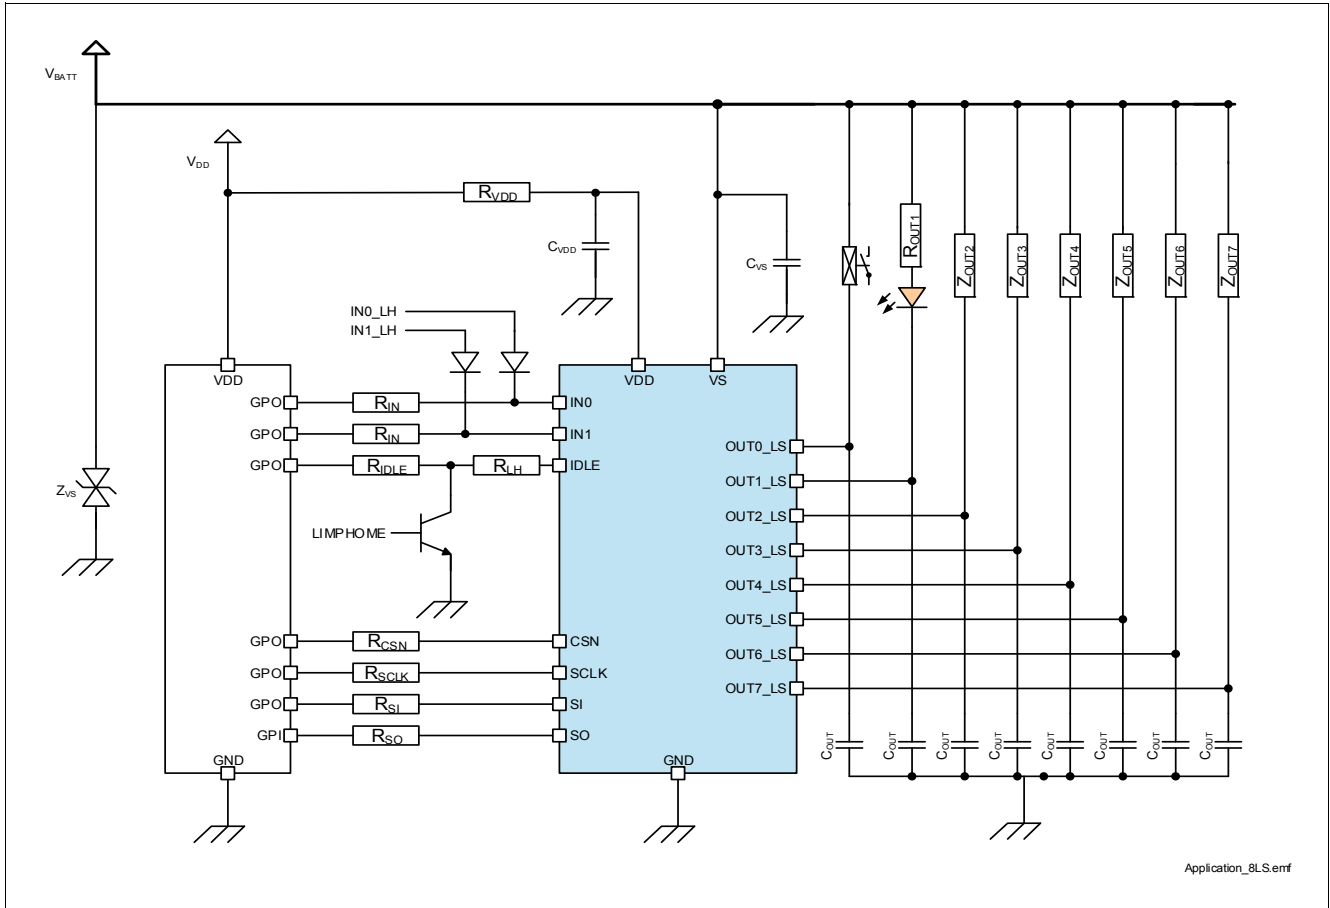

Figure 32 TLE75008-EMD Application Diagram

Note: This is a very simplified example of an application circuit. The function must be verified in the real application.

Table 19 Suggested Component values

Reference	Value	Purpose
R_{IN}	4.7 k Ω	Protection of the micro-controller during Over Voltage and Reverse Polarity Guarantee TLE75008-EMD channels OFF during Loss of Ground
R_{IDLE}	4.7 k Ω	Protection of the micro-controller during Over Voltage and Reverse Polarity Guarantee TLE75008-EMD channels OFF during Loss of Ground
R_{CSN}	500 Ω	Protection of the micro-controller during Over Voltage and Reverse Polarity
R_{SCLK}	500 Ω	Protection of the micro-controller during Over Voltage and Reverse Polarity
R_{SI}	500 Ω	Protection of the micro-controller during Over Voltage and Reverse Polarity
R_{SO}	500 Ω	Protection of the micro-controller during Over Voltage and Reverse Polarity
R_{VDD}	100 Ω	Logic supply voltage spikes filtering
C_{VDD}	100 nF	Logic supply voltage spikes filtering

Table 19 Suggested Component values (cont'd)

Reference	Value	Purpose
C_{VS}	68 nF	Analog supply voltage spikes filtering
Z_{VS}	P6SMB30	Protection of device during Over Voltage. Zener diode
C_{OUT}	10 nF	Protection of TLE75008-EMD against ESD and BCI

11.1 Further Application Information

12 Package Outlines

Figure 33 PG-SSOP-24-9 Package drawing

Figure 34 TLE75008-EMD Package pads and stencil

Note: Although the package footprint refer to PG-SSOP-24-4, they can be used as reference also the PG-SSOP-24-9 (physical dimensions are the same).

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
