### ■ NOTICES

- Please carefully treat this spec since it includes the copyright-related contents. It is strictly prohibited to copy or reprint this spec regardless of partially or whole, without our prior written approval.
- 2. Content in this spec shall not guarantee any of the third party's intellectual property right or other patents. Tottori SANYO will not be liable for the industrial property issue arising between user and the third party.
- 3. This product is designed and manufactured only for general AV instruments usage. It is not suitable for the purpose or equipment that required extremely high reliability or safety. Ex: Aerospace instrument, control equipment for nuclear power, live support devices, etc.
- 4.Please use this product correctly according to operating conditions and precautions for use stated in this document.

Please install safety proof in your designing to avoid human accident, fire accident and social damage which may be resulted from malfunction of this product.

- 5.Radiation proof design is not applied on this product.
- 6.Tottori SANYO will not be liable for any damages or disadvantages caused by our product in the event that user does not follow condition or precaution stated in our spec.
- 7.Separate inspection standard spec is applied for cosmetic criteria.
- 8.If you should have questions on this product, please kindly contact our sales section.

Tottori SANYO Electric Co., Ltd.	TM058WA-22L04	Ver. 2	Page	1/22

		Tor	2	Operation	-30	85		
Humidity		-		TaC=<60deg.		90	%RH	not beyond 240H
								Note 3)

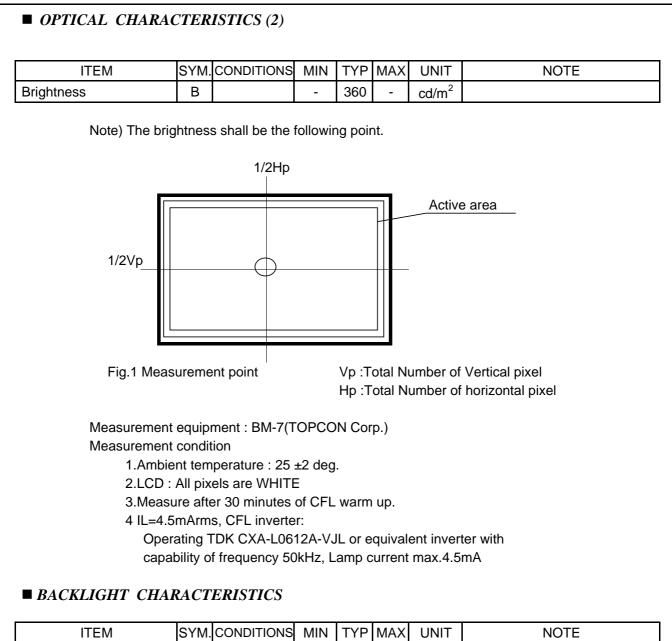

Note 1) Care should be taken so that the LCD module may not be subjected to the temperature beyond this specification.

- Note 2) Ambient temperature shows temperature on LCD surface. Module temperature is apt to increace while it's driving due to CFL heat etc. Please design carefully not to exceed +85 degree C on every surface of LCD that shoud come to contact with any other equipment. Temperature for operation is one which only assures LCD operation. Contrast, response time,or other LCD quality is regulated under condition of Ta=+25 degree C.
- Note 3) Please be advised that dew condensation level should be less than maximum wet bulb temperature 58 degree C. Dew condensation may induce leak current, and also influence LCD performance.

Note 4) In external clock input mode, they show input phase contrast of HSYIO andVSYIO signal. Data is loaded latching with HSYIO falling signal.

# ■ *PRECAUTIONS (INSTRUCTIONS FOR SAFE AND PROPER USE)*

### 1.Instructions for safety

- Please do not disassemble or modify LCD module to avoid the possibility of electric shock, damage of electronic components, scratch at display surface and invasion of foreign particles. In addition, such activity may result in fire accident due to burning of electronic component.LCD module disassembled or modified by customer is out of warranty.
- 2. Please be careful in handling of LCD module with broken glass. When the display glass breaks, please pay attention not to injure your fingers. The display surface has the plastic film attached, which prevents dispersion of glass pieces, however touching broken edge will injure your fingers. Also CFL (Cold Cathode Fluorescent Lamp) is made of glass, therefore please pay attention in the same way.
- 3. Please do not touch the fluid flown out of broken display glass. If the fluid should stick to hand or clothes, wipe off with soap or alcohol immediately and then wash it with water. If the fluid should get in eyes, wash eyes immediately with pure water for more than 15 minutes and then consult the doctor.
- 4. Please make secure connection of CFL connector.

Please make sure that CFL connector from LCD module is connected with output connector on inverter circuit securely. Poor connection may cause smoke or fire accident due to high voltage in circuit. If connection may not be secure, please switch off the power supply for LCD module and CFL and then make secure connection.

Please do not make connection with another connector than recommended mating connector.

- 5. CFL contains mercury inside. Please follow regulations or rules established by local autonomy at its disposal.
- 6. Please be careful to electric shock.

Before handling LCD module, please switch off the power supply. Since high voltage is applied to CFL terminal, cable, connector and inverter circuit in operation mode, touching them will cause electric shock.

### 2.Instructions for designing

1. Mounting of LCD

Please fix LCD module at all mounting flanges shown in this specification for installation onto system. The used screws should have proper dimensions.

Furthermore, designing of mounting parts should be adequate so that LCD module is not warped or twisted, to achieve good display quality.

2. Polarity of power supply for CFL

Please give careful consideration in designing so that each polar of cable should be connected correctly at assembling (i.e. high voltage side is connected to high voltage side and low voltage side is connected to low voltage side). Since longer CFL cable may cause insatiable start-up of CFL and reduction of brightness, please make cable short as much as possible.

3. Designing of power supply circuit for CFL

Please design the circuit so that high voltage output can be kept for more than 1 second. The shorter time may not start up CFL. The driving inverter circuit is recommended to be the type which CFL current can be controlled.

The type which voltage is controlled is not recommended, because it may cause big current under high temperature and insatiable start-up of CFL under low temperature.

Tottori SANYO Electric Co., Ltd.	TM058WA-22L04	Ver. 2	Page	18/22	
----------------------------------	---------------	--------	------	-------	--

4. Heat radiation

CFL generates heat at lighting and causes temperature rise inside system. Therefore, designing to radiate heat like radiation slits at cabinet is recommended to meet the specified operating temperature range for LCD module.

5. Noise on power line

Spike noise contained in power line causes abnormal operation of driving circuit and abnormal display. To avoid it, spike noise should be suppressed below VDD +/- 200mVp-p. (In any case, absolute maximum rating should be kept.)

6. Power sequence

Before LCD module is switched on, please make sure that power supply and input signals of system, testing equipment, etc. meet the recommended power sequence.

7. Absolute maximum rating

Absolute maximum rating specified in this specification has to be kept in any case. It shows the maximum that cannot be exceeded.

Exceeding it may cause burning or non-recoverable break of electronic components in circuit. Please make system design so that absolute maximum rating is not exceeded even if ambient temperature, input signal and components are varied.

8. Protection for power supply

Please study to adapt protection for power supply against trouble of LCD module, depending on usage condition of system. Fuse installed on LCD module should be never modified. Any modification to make the function of fuse ineffective may cause burning or break of printed wiring board or other components at circuit trouble.

9. Protection against electric shock

High voltage is applied to CFL connector, inverter circuit and CFL at lighting. Please make design not to expose or be accessible to such high voltage parts to avoid electric shock.

10. Protection cover and cut-off filter for ultraviolet rays

When LCD module is used under severe condition like outdoor, it is recommended to use transparent protection cover over display surface to avoid scratches and invasion of dust and water. In addition, when recommended. Please be careful not to get condensation.

### 3.Instructions for use and handling

1. Protection against Static electricity

C-MOS LSI and semiconductors are easily damaged by static discharge. LCD module should be handled on conductive mat by person grounded with wrist strap etc. to avoid getting static electricity. Please be careful not to generate static electricity during operation.

2. Protection against dust and stain

LCD module should be handled in circumstance as clean as possible. It is recommended to wear fingerstalls or ductless and soft gloves before handling to avoid getting dust or stain on display surface.

Tottori SANYO Electric Co., Ltd.	TM058WA-22L04	Ver. 2	Page	19/22
----------------------------------	---------------	--------	------	-------

#### 3. Protection film for display surface

It is recommended to remove protection film at nearly final process of assembling to avoid getting scratch or dust. To remove film, please pick up its edge with dull-head tweezers or cellophane tape at first and then remove film gradually taking more than 3 seconds. If film is removed quickly, static electricity may be generated and may damage semiconductors or electronic components.

#### 4. Contamination of display surface

When display surface of LCD module is contaminated, please wipe the surface softly with cotton swab or clean cloth. If it is not enough, please take it away with cellophane tape or wipe the surface with cotton swab or clean cloth containing benzine. In this case, please be careful so that benzine does not get in inside of LCD module, because it may be damaged.

#### 5. Water drop on LCD surface

Please do not leave LCD module with water drop. When the display surface gets water drop, please wipe it off with cotton swab or soft cloth immediately, otherwise display surface will be deteriorated. If water gets in inside of LCD module, circuit may be damaged.

6. Please make sure that LCD module is not warped or twisted at installation into system. Even temporary warp or twist may be the cause for failure.

#### 7. Mechanical stress

Please be careful not to apply strong mechanical stress like drop or shock to LCD module. Such stress may cause break of display glass and CFL or may be the cause for failure.

#### 8. Pressure to display surface

Please be careful not to apply strong pressure to display surface. Such pressure may cause scratches at surface or may be the cause of failure.

#### 9. Protection against scratch

Please be careful not to hit, press or rub the display surface with hard material like tools. In addition, please do not put heavy or hard material on display surface, and do not stack LCD modules. Polarizer at front surface can be easily scratched.

#### 10.Plugging in of connector

Please be careful not to apply strong stress to connector part of LCD module at plugging in or out, because strong stress may damage the inside connection. At plugging in connector, place LCD module on the flat surface and hold the backside of connector on LCD module. Please make sure that connector is plugged in correctly. Insecure connection may be the cause for failure during operation. In addition, please be careful not to put the connecting cable between cabinet of system and LCD module at installing LCD module into system.

#### 11.Handling of CFL cable and FPC (Flexible Printed Circuit)

Please be careful not to pull or scratch CFL cable, because CFL or soldered part of cable may be damaged consequently.

Also FPC should not be pulled or scratched.

#### 12.Switching off before plugging in connector

Please make sure that power is switched off before plugging in connector.

If power is on at plugging in or out, circuit of LCD module may be damaged.

When LCD is switched on for test or inspection, please make sure that power supply and input signals of driving system meet the specified power sequence.

13. Temperature dependence of LCD display

Response speed (optical response) of LCD display is dependent on temperature. Under low temperature, response speed is slower.

Also brightness and chromaticity change slightly depending on temperature.

14.Slow light-up of CFL under low temperature

Under low temperature, start-up of CFL gets difficult. (The time from switch-on to stable lighting becomes longer.)

As characteristic of CFL, operation under low temperature makes the life time shorter. To avoid this, it is recommended to operate under normal temperature.

15.Condensation

LCD module may get condensation on its display surface and inside in the circumstance where temperature changes much in short time.

Condensation can cause deterioration or failure. Therefore, please be careful not to get condensation.

16.Remaining of image

Displaying the same pattern for long time may cause remaining of image even after changing the pattern. This is not failure but will disappear with time.

### 4.Instructions for storage and transportation

1. Storage

Please store LCD module in the dark place of room temperature and low humidity in original packing condition, to avoid condensation that may cause failure. Since sudden temperature change may cause condensation, please store in circumstance of stable temperature.

2. Stacking number

Since excessive weight causes deformation and damage of carton box, please stack only up to the number stated on carton box for storage and transportation.

3. Handling

Since LCD module consists of glass and precise electronic components, it will be damaged by excessive shock and drop. Therefore, please handle the carton box carefully to minimize shock at loading, reloading and transportation.
