## AMENDMENT HISTORY

Version	Date	Description
V0.90	Mar, 2020	New Release.
V0.91	Apr, 2020	1. Add ADC electrical characteristics description. 2. Modify Timer3 description. 3. Some error correction.
V0.92	Jul, 2020	1. Add SOP16 package type. 2. Remove the suffix T for package type. 3. Some error correction.
V0.93	Jul, 2020	1. Modify QFN28 、QFN20 package type.
V0.94	Nov, 2020	1. Modify operating voltage @F <sub>SYSCLK</sub> =7.3728 MHz. 2. Modify the minimum of I/O port sink current. 3. Some error correction.
V0.95	Dec, 2020	1. Modify absolute maximum ratings 2. Some error correction
V0.96	Jul, 2021	1. Modify description about the chapter of LCD and LED 2. Added description of ADC capacitor 3. Some error correction

## GENERAL DESCRIPTION

**TM52** series **FE8273/76/74/78** are versions of a new, fast 8051 architecture for an 8-bit microcontroller single chip with an instruction set fully compatible with industry standard 8051, and retains most 8051 peripheral's functional block. Typically, the **TM52** executes instructions six times faster than the standard 8051 architecture.

The **TM52-FE8273/76/74/78** provides improved performance, lower cost and fast time-to-market by integrating features on the chip, including 8K/16K Bytes Flash program memory, 128 Bytes EEPROM data memory, 1024 Bytes SRAM, Low Voltage Reset (LVR), dual clock power saving operation mode, 8051 standard UART and Timer0/1/2, real time clock Timer3, LCD/LED driver, 3 set (8+2)-bit PWMs, 14 channels 12-bit A/D Convertor, 15 channels Touch Key (FE8276/78 only) and Watch Dog Timer. It's a high reliability and low power consumption feature can be widely applied in consumer and home appliance products.

## BLOCK DIAGRAM

**Note:** 8K Bytes Flash program memory (TM52FE8274/78)  
16K Bytes Flash program memory (TM52FE8273/76)

## FEATURES

### 1. Standard 8051 Instruction set, fast machine cycle

- Executes instructions six times faster than the standard 8051.

### 2. Flash Program Memory

- 8K Bytes (TM52FE8274/78)
- 16K Bytes (TM52FE8273/76)
- Support “In Circuit Programming” (ICP) or “In System Programming” (ISP) for the Flash code
- Byte Write “In Application Programming” (IAP) mode is convenient as Data EEPROM access
- Code Protection Capability
- 10K erase times at least
- 10 years data retention at least

### 3. 128 Bytes EEPROM Memory

- 50K erase times at least
- 10 years data retention at least

### 4. Total 1024 Bytes SRAM (IRAM + XRAM)

- 256 Bytes IRAM in the 8051 internal data memory area
- 768 Bytes XRAM in the 8051 external data memory area (accessed by MOVX Instruction)

### 5. Four System Clock type selections

- Fast clock from 1~16MHz Crystal (FXT)
- Fast clock from Internal RC (FRC, 14.7456 MHz)
- Slow clock from 32768Hz Crystal (SXT)
- Slow clock from Internal RC (SRC, 68 KHz)
- System Clock can be divided by 1/2/4/16 option

### 6. 8051 Standard Timer – Timer0/1/2

- 16-bit Timer0, also supports T0O clock output for Buzzer application
- 16-bit Timer1
- 16-bit Timer2, also supports T2O clock output for Buzzer application

### 7. 15-bit Timer3

- Clock source is Slow clock
- Interrupt period can be clock divided by 32768/16384/8192/4096/2048/1024/512/256 option

### 8. UARTs

- UART1, 8051 standard UART, One Wire UART option can be used for ISP or other application
- UART2, the second UART, supports only mode1 and mode3

**9. Three independent "8+2" bits PWMs with prescaler/ period-adjustment****10. SPI Interface**

- Master or Slave mode selectable
- Programmable transmit bit rate
- Serial clock phase and polarity options
- MSB-first or LSB-first selectable

**11. 15-Channel Touch Key (FE8276/78 only)**

- Internal reference key
- Touch Key clock Auto-change

**12. 12-bit ADC with 14 channels External Pin Input and 2 channels Internal Reference Voltage**

- Internal Reference Voltage (VBG):  $1.22V \pm 1\%$  @  $V_{CC}=5V \sim 3V$ ,  $25^{\circ}C$
- Internal Reference Voltage:  $V_{CC}/4$
- ADC reference voltage =  $2.5V / 3.0V / 4.0V / V_{CC}$

**13. LCD Driver**

- Software controlled COM00~07, COM10~17, COM20~21, COM30~37 (Max. 26 pins)
- 1/2 LCD Bias

**14. LED Controller/Driver**

- New Matrix mode function
- Max. 10 pins (4 COM x 4 SEG ~ 4 COM x 6 SEG)
- COM with Dead Time
- 3groups, 8-level Brightness with smooth option
- LED hold function

**15. 12 Sources, 4-level priority Interrupt**

- Timer0/Timer1/Timer2/Timer3 Interrupt
- INT0/INT1 pin Falling-Edge/Low-Level Interrupt
- Port1 Pin Change Interrupt
- UART1/UART2 TX/RX Interrupt
- P3.7 (INT2) pin Interrupt
- ADC/Touch Key Interrupt
- SPI Interrupt

**16. Pin Interrupt can Wake up CPU from Power-Down (Stop) mode**

- P3.2/P3.3 (INT0/INT1) Interrupt & Wake-up
- P3.7 (INT2) Interrupt & Wake-up
- Each Port1 pin can be defined as Interrupt & Wake-up pin (by pin change)

**17. Max. 26 Programmable I/O pins**

- CMOS Output
- Pseudo-Open-Drain, or Open-Drain Output
- Schmitt Trigger Input
- Pin Pull-up can be Enabled or Disabled
- All pin with High sink (80mA@ $V_{CC}=5V$ ,  $V_{OL}=0.1V_{CC}$ )

**18. Independent RC Oscillating Watch Dog Timer**

- 480ms/240ms/120ms/60ms selectable WDT timeout options

**19. Five types Reset**

- Power on Reset
- Selectable External Pin Reset
- Selectable Watch Dog Reset
- Software Command Reset
- Selectable Low Voltage Reset

**20. 8-level Low Voltage Reset**

- 2.4V/2.7V/2.9V/3.2V/3.5V/3.8V/4.0V/4.3V (can be disabled)

**21. Five Power Operation Modes**

- Fast/Slow/Idle/Stop/Halt mode

**22. Integrated 16-bit Cyclic Redundancy Check function****23. On-chip Debug/ICE interface**

- Use P3.0/P3.1 pin or P0.0/P0.1 pin
- Share with ICP programming pin

**24. Operating Voltage and Current**

- $V_{CC}=3.8V \sim 5.5V$  @ $F_{SYSCLK}=14.7456$  MHz ( $-40^{\circ}C \sim 85^{\circ}C$ )
- $V_{CC}=3.2V \sim 5.5V$  @ $F_{SYSCLK}=14.7456$  MHz ( $25^{\circ}C$ )
- $V_{CC}=2.4V \sim 5.5V$  @ $F_{SYSCLK}=7.3728$  MHz
- $V_{CC}=2.4V \sim 5.5V$  @ $F_{SYSCLK}=3.6864$  MHz
- $I_{CC}=0.1\mu A$  @Stop mode, PWRSAV=1,  $V_{CC}=3V$
- $I_{CC}=10\mu A$  @Idle mode, PWRSAV=1,  $V_{CC}=3V$

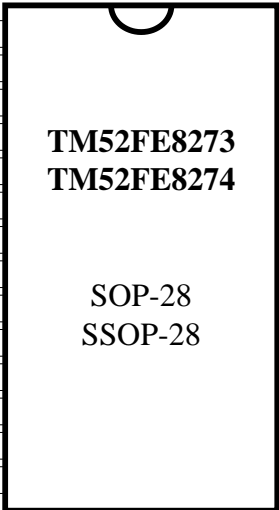

**25. Operating Temperature Range**

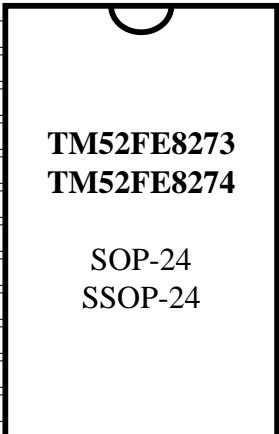

- $-40^{\circ}C \sim +85^{\circ}C$

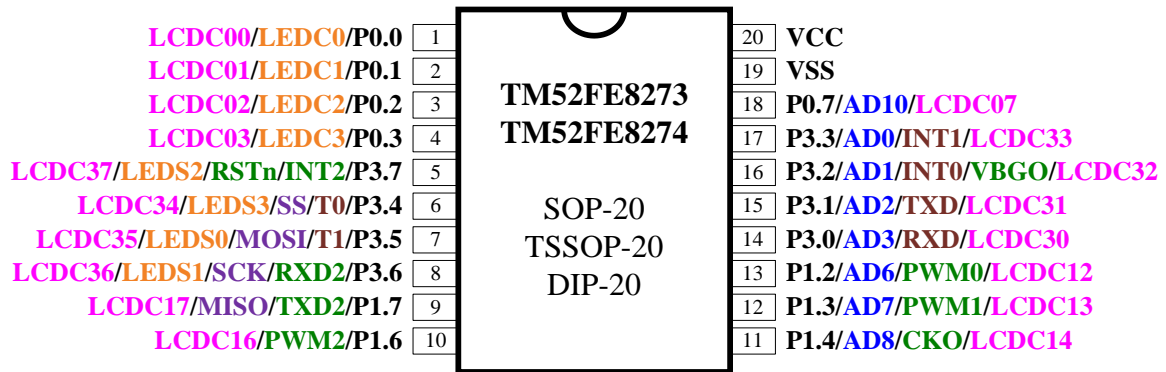

**26. Package Types**

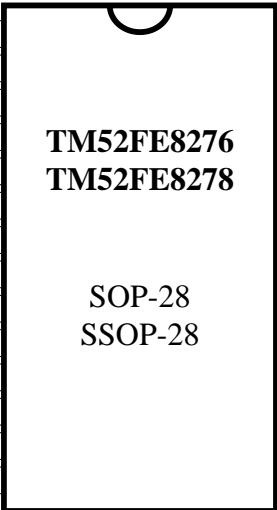

- 28-pin SOP (300 mil)
- 28-pin SSOP (150 mil)
- 28-pin QFN (4x4x0.75-0.4mm)
- 24-pin SOP (300mil)
- 24-pin QFN (4x4x0.75-0.5mm)
- 20-pin SOP (300 mil)
- 24-pin SSOP (150 mil)
- 20-pin TSSOP (173 mil)
- 20-pin DIP (300 mil)
- 20-pin QFN (3x3x0.75-0.4mm) (L=0.25mm)
- 16-pin SOP (150 mil)

## PIN DESCRIPTION

Name	In/Out	Pin Description
P0.0~P0.7	I/O	Bit-programmable I/O port for Schmitt-trigger input or CMOS push-pull output. Pull-up resistors are assignable by software.
P1.0~P1.7	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or "open-drain" output. Pull-up resistors are assignable by software. These pin's level change can interrupt/wake up CPU from Idle/Stop/Halt mode.
P2.0~P2.1	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or "open-drain" output. Pull-up resistors are assignable by software.
P3.0~P3.2	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or "pseudo open drain" output. Pull-up resistors are assignable by software.
P3.3~P3.7	I/O	Bit-programmable I/O port for Schmitt-trigger input, CMOS push-pull output or "open-drain" output. Pull-up resistors are assignable by software.
INT0, INT1	I	External low level or falling edge Interrupt input, Idle/Stop mode wake up input.
INT2	I	External falling edge Interrupt input, Idle/Stop mode wake up input.
RXD	I/O	UART1 Mode0 transmit & receive data, Mode1/2/3 receive data
RXD2	I/O	UART2 Mode1/3 receive data
TXD	I/O	UART1 Mode0 transmit clock, Mode1/2/3 transmit data. In One Wire UART mode, this pin transmits and receives serial data.
TXD2	I/O	UART2 Mode1/3 transmit data.
T0, T1, T2	I	Timer0, Timer1, Timer2 event count pin input.
T2EX	I	Timer2 external trigger input.
T0O	O	Timer0 overflow divided by 64 output
T2O	O	Timer2 overflow divided by 2 output
CKO	O	System Clock divided by 2 output
VBGO	O	Bandgap voltage output
PWM0~PWM2	O	8+2 bit PWM output
AD0~AD10 AD12~AD14	I	ADC input
TK0~TK14	I	Touch Key input ( <b>FE8276/78 only</b> )
LCDC00~LCDC07 LCDC10~LCDC17 LCDC20~LCDC21 LCDC30~LCDC37	O	LCD 1/2 bias output
LEDC0~LEDC3	O	LED common output
LEDS0~LEDS5	O	LED segment output
MISO	I/O	SPI data input for master mode, data output for slave mode
MOSI	I/O	SPI data output for master mode, data input for slave mode
SS	I	SPI active low slave select input for slave mode
SCK	I/O	SPI clock output for master or clock input for slave mode
RSTn	I	External active low reset input, Pull-up resistor is fixed enable.
XI, XO	–	Crystal/Resonator oscillator connection for System clock (FXT or SXT)
VCC, VSS	P	Power input pin and ground

- ⊙ Port0 control Pull up resistor while P0OE.n=0 and P0.n=1

## FUNCTIONAL DESCRIPTION

### 1. CPU Core

In the 8051 architecture, the C programming language is used as a development platform. The TM52 device features a fast 8051 core in a highly integrated microcontroller, allowing designers to be able to achieve improved performance compared to a classic 8051 device. TM52 series microcontrollers provide a complete binary code with standard 8051 instruction set compatibility, ensuring an easy migration path to accelerate the development speed of system products. The CPU core includes an ALU, a program status word (PSW), an accumulator (ACC), a B register, a stack point (SP), DPTRs, a program counter, an instruction decoder, and core special function registers (SFRs).

#### 1.1 Accumulator (ACC)

This register provides one of the operands for most ALU operations. Accumulators are generally referred to as A or Acc and sometimes referred to as Register A. In this document, the accumulator is represented as “A” or “ACC” including the instruction table. The accumulator, as its name suggests, is used as a general register to accumulate the intermediate results of a large number of instructions. The accumulator is the most important and frequently used register to complete arithmetic and logical operations. It holds the intermediate results of most arithmetic and logic operations and assists in data transportation.

SFR E0h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>ACC</b>	ACC.7	ACC.6	ACC.5	ACC.4	ACC.3	ACC.2	ACC.1	ACC.0

Reset	0	0	0	0	0	0	0	0

E0h.7~0 **ACC**: Accumulator

#### 1.2 B Register (B)

The “B” register is very similar to the ACC and may hold a 1 Byte value. This register provides the second operand for multiply or divide instructions. Otherwise, it may be used as a scratch pad register. The B register is only used by two 8051 instructions, MUL and DIV. When A is to be multiplied or divided by another number, the other number is stored in B. For MUL and DIV instructions, it is necessary that the two operands are in A and B.

ex: DIV AB

When this instruction is executed, data inside A and B are divided, and the answer is stored in A.

Reset	0	0	0	0	0	0	0	0

F0h.7~0 **B**: B register

### 1.3 Stack Pointer (SP)

The SP register contains the Stack Pointer. The Stack Pointer is used to load the program counter into memory during LCALL and ACALL instructions and is used to retrieve the program counter from memory in RET and RETI instructions. The stack may also be saved or loaded using PUSH and POP instructions, which also increment and decrement the Stack Pointer.

<b>SP</b>	SP							
R/W	R/W							
Reset	0	0	0	0	0	1	1	1

81h.7~0 **SP:** Stack Point

### 1.4 Dual Data Pointer (DPTRs)

TM52 device has two DPTRs, which share the same SFR address. Each DPTR is 16 bits in size and consists of two registers: the DPTR high byte (DPH) and the DPTR low byte (DPL). The DPTR is used for 16-bit-address external memory accesses, for offset code byte fetches, and for offset program jumps. Setting the DPSEL control bit allows the program code to switch between the two physical DPTRs.

F8h.0 **DPSEL:** Active DPTR Select

### 1.5 Program Status Word (PSW)

This register contains status information resulting from CPU and ALU operations. The instructions that affect the PSW are listed below.

Instruction	Flag		
	C	OV	AC
ADD	X	X	X
ADDC	X	X	X
SUBB	X	X	X
MUL	0	X	
DIV	0	X	
DA	X		
RRC	X		
RLC	X		
SETB C	1		

Instruction	Flag		
	C	OV	AC
CLR C	0		
CPL C	X		
ANL C, bit	X		
ANL C, /bit	X		
ORL C, bit	X		
ORL C, /bit	X		
MOV C, bit	X		
CJNE	X		

A “0” means the flag is always cleared, a “1” means the flag is always set and an “X” means that the state of the flag depends on the result of the operation.

SFR D0h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>PSW</b>	CY	AC	F0	RS1	RS0	OV	F1	P
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

D0h.7 **CY**: ALU carry flag

D0h.6 **AC**: ALU auxiliary carry flag

D0h.5 **F0**: General purpose user-definable flag

D0h.4~3 **RS1, RS0**: The contents of (RS1, RS0) enable the working register banks as:

00: Bank 0 (00h~07h)

01: Bank 1 (08h~0Fh)

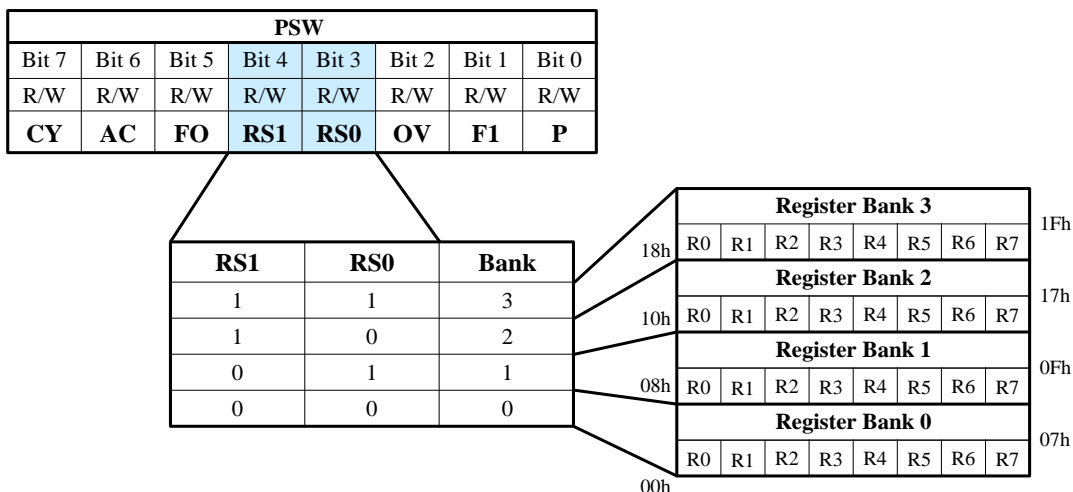

10: Bank 2 (10h~17h)

11: Bank 3 (18h~1Fh)

D0h.2 **OV**: ALU overflow flag

D0h.1 **F1**: General purpose user-definable flag

D0h.0 **P**: Parity flag. Set/cleared by hardware each instruction cycle to indicate odd/even number of “one” bits in the accumulator.

## 2. Memory

### 2.1 Program Memory

The Chip has a 16K Bytes Flash program memory for **TM52FE8273/76**, and an 8K Bytes Flash program memory for **TM52FE8274/78** which can support In Circuit Programming (ICP), In Application Programming (IAP) and In System Programming (ISP) function modes. The Flash write endurance is at least 10K cycles. The program memory address continuous space (0000h~3FFFh) is partitioned to several sectors for device operation.

#### 2.1.1 Program Memory Functional Partition

The last 8 bytes (3FF8h~3FFFh) of program memory is defined as chip Configuration Word (CFGW), which is loaded into the device control registers upon power on reset (POR). The 0000h~006Fh is occupied by Reset/Interrupt vectors as standard 8051 definition. For **TM52FE8273/76**, the address space 3000h~3FEFh is defined as the IAP area. For **TM52FE8274/78**, the address space 1000h~1FEFh is defined as the IAP area. In the in-circuit emulation (ICE) mode, user also needs to reserve the address space 2D00h~2FFFh for ICE System communication. CRC16H/L is the reserved area of the checksum. Tenx can provide a CRC verification subroutine. The user can calculate the checksum by the CRC verification subroutine to compare with CRC16H/L and check the validity of the ROM code.

**TM52FE8273/76**
**TM52FE8274/78**

### 2.1.2 Flash ICP Mode

The Flash memory can be programmed by the tenx proprietary writer (**TWR99/TWR100**), which needs at least four wires (VCC, VSS, P3.0 and P3.1) to connect to this chip. If user wants to program the Flash memory on the target circuit board (In Circuit Program, ICP), these pins must be reserved sufficient freedom to be connected to the Writer. The P3.0 and P3.1 pin's can be replaced by P0.0 and P0.1.

Writer wire number	Pin connection
4-Wire	VCC, VSS, P3.0, P3.1
	VCC, VSS, P0.0, P0.1

### 2.1.3 Flash IAP Mode

The **FE8273/76/74/78** has “In Application Program” (IAP) capability, which allows software to read/write data from/to the Flash memory during CPU run time as conveniently as data EEPROM access. The IAP function is byte writable, meaning that the **FE8273/76/74/78** does not need to erase one Flash page before write. The available IAP data space is 248 Bytes after chip reset, and can be re-defined by the “MVCLOCK” and “IAPALL” control register as shown below.

16K Bytes Flash Program memory		Flash memory	MVCLOCK	IAPALL	MOVC Accessible	MOVX (IAP) Accessible
0000h	MOVC-Lock area	0000h~01FFh	1	X	No	No
01FFh			0	0	Yes	No
0200h			0	1	Yes	Yes
0200h	IAP-All area	0200h~3EFFh	X	0	Yes	No
3EFFh			X	1	Yes	Yes
3F00h	IAP-Free area	3F00h~3FF7h	X	X	Yes	Yes
3FF7h			X	0	Yes	No
3FF8h	CFGW area	3FF8h~3FFEh	X	1	Yes	Yes
3FFFh			X	X	Yes	No
		3FFFh	X	X	Yes	No

In IAP mode, the program Flash memory is separated into four sectors: MOVC-Lock area, IAP-All area, IAP-Free area, and CFGW area. These four sectors are regulated differently.

In the **MOVC-Lock area**, IAP read/write is limited by MVCLOCK bit, which can be set to control the accessibility of the MOVC and MOVX instructions to this area. The size of this area is 512 Bytes. The lock function is made to protect the main program code against unconsciously writing Flash memory in IAP mode. Locking or unlocking the function should be performed by the tenx TWR98/99 writing to the CFGW in Flash memory.

The **IAP-All area** is protected by the IAPALL register to prevent IAP mode from writing application data to the program area, resulting in a program code error that cannot be repaired. The size of this area is 15616 Bytes. Enabling IAPALL requires writing 65h to SFR SWCMD 97h to set the IAPALL control flag. Then, software can use MOVX instructions to write application data to flash memory from 0200h to 3EFFh. If user wants to disable IAPALL function, user can write other values to SFR SWCMD 97h to clear the IAPALL control flag. User must be careful not to overwrite program code which is already resided on the same Flash memory area.

The **IAP-Free area** has no control bit to protect. It can be used to reliably store system application data that needs to be programmed once or periodically during system operation. Other areas of Flash memory can be used to store data, but this area is usually better. The size of this area is 248 Bytes, equivalent to an EEPROM, and Flash memory can provide byte access to read and write commands. The **FE8273/76/74/78** has a true EEPROM memory. It has the wider writing voltage range and the better write endurance than Flash memory. It is recommended to use EEPROM memory to store application data first.

The **CFGW area** has 3 data bytes (CFGWH, CFGWL and CFGBG), which is located at the last 8 addresses of Flash memory. The CFGWH is not accessible to IAP, while the CFGWL and CFGBG can be read or written by IAP in case the IAPALL flag is set. CFGWL is copied to the SFR F6h and CFGBG is copied to the SFR F5h after power on reset, software then take over CFGWL's and CFGBG's control capability by modifying the SFR F6h and F5h.

#### 2.1.4 IAP Mode Access Routines

**Flash IAP Write** is simply achieved by a “MOVX @DPTR, A” instruction while the DPTR contains the target Flash address (0000h~3F00h), and the ACC contains the data being written. The **FE8273/76/74/78** accepts IAP write command only when IAPWE=1. Flash IAP writing one byte requires approximately 2 ms @V<sub>CC</sub>=3.2V, 1 ms @V<sub>CC</sub>=5V. Meanwhile, the CPU stays in a waiting state, but all peripheral modules (Timers, LED, and others) continue running during the writing time. The software must handle the pending interrupts after an IAP write. The **FE8273/76/74/78** has a build-in IAP Time-out function for escaping write fail state. Flash IAP writing needs higher V<sub>CC</sub> voltage, V<sub>CC</sub>>3.2V.

Because the Program memory and the IAP data space share the same entity, a **Flash IAP Read** can be performed by the “MOVX A, @DPTR” or “MOVC” instruction as long as the target address points to the 0000h~3F00h area. A Flash IAP read does not require extra CPU wait time.

```

; IAP example code (ASM)
; need 3.2V < VDD < 5.5V
MOV     DPTR, #3F00h      ; DPTR=3F00h=target IAP address
MOV     A, #5Ah           ; A=5Ah=target IAP write data
MOV     IAPWE, #47h       ; IAP write enable
MOV     AUX2, #02h        ; IAP Time-Out function enable
MOVX    @DPTR, A          ; Flash[3F00h] =5Ah, after IAP write
                        ; 1ms~2ms H/W writing time, CPU wait
MOV     IAPWE, #00h       ; IAP write disable, immediately after IAP write
CLR     A                 ; A=0
MOVX    A, @DPTR          ; A=5Ah
CLR     A                 ; A=0
MOVC    A, @A+DPTR        ; A=5Ah

```

```

; IAP example code (C)
; need 3.2V < VDD < 5.5V
unsigned char xdata PROM[4096] _at_ 0x2000 // 0x2000 = start address
unsigned char code CODE[4096] _at_ 0x2000 // 0x2000 = start address

```

```

IAPALL = 0x65;
IAPWE = 0x47;

00: Disable

01: wait 0.9mS trigger watchdog time-out flag, and escape the write fail state

10: wait 3.6mS trigger watchdog time-out flag, and escape the write fail state

11: wait 7.2mS trigger watchdog time-out flag, and escape the write fail state

### 2.1.5 Flash ISP Mode

The “In System Programming” (ISP) usage is similar to IAP, except the purpose is to refresh the Program code. User can use UART/SPI or other method to get new Program code from external host, then writes code as the same way as IAP. ISP operation is complicated; basically it needs to assign a Boot code area to the Flash which does not change during the ISP process.

## 2.2 EEPROM Memory

The **FE8273/76/74/78** contains 128 bytes of data EEPROM memory. It is organized as a separate data space, in which single bytes can be read and written. The EEPROM has an endurance of at least 50K write/erase cycles.

EEPROM Memory	
<b>EE00h</b>	EEPROM[0]
<b>EE02h</b>	EEPROM[1]
<b>EE04h</b>	.
	.
	.
<b>EEFCh</b>	EEPROM[126]
<b>EEFEh</b>	EEPROM[127]

(Only even addresses can be used, odd addresses are invalid)

**The EEPROM Write** usage is similar to Flash IAP mode. It is simply achieved by a “MOVX @DPTR, A” instruction while the DPTR contains the target EEPROM address (EE00h~EEFEh, ADDR=ADDR+2), and the ACC contains the data being written. EEPROM writing requires approximately 2 ms @V<sub>CC</sub>=3V, 1 ms @V<sub>CC</sub>=5V. Meanwhile, the CPU stays in a waiting state, but all peripheral modules (Timers, LED, and others) continue running during the writing time. The software must handle the pending interrupts after an EEPROM write. The **FE8273/76/74/78** has a build-in EEPROM Time-out function shared with Flash IAP for escaping write fail state. EEPROM writing needs V<sub>CC</sub>>3.0V.

**The EEPROM Read** can be performed by the “MOVX A, @DPTR” instruction as long as the target address points to the EE00h~EEFEh area. The EEPROM read does require approximately 300ns.

```

; EEPROM example code
; need 3.0V < VDD < 5.5V

## 2.3 Data Memory

As the standard 8051, the Chip has both Internal and External Data Memory space. The Internal Data Memory space consists of 256 Bytes IRAM and 74 SFRs, which are accessible through a rich instruction set. The External Data Memory space consists of 768 Bytes XRAM, 6 Bytes LCD RAM, 128 Bytes EEPROM and IAP Flash, which can be only accessed by MOVX instruction.

### 2.3.1 IRAM

IRAM is located in the 8051 internal data memory space. The whole 256 Bytes IRAM are accessible using indirect addressing but only the lower 128 Bytes are accessible using direct addressing. There are four directly addressable register banks (switching by PSW), which occupy IRAM space from 00h to 1Fh. The address 20h to 2Fh 16 Bytes IRAM space is bit-addressable. IRAM can be used as scratch pad registers or program stack.

### 2.3.2 XRAM

XRAM is located in the 8051 external data memory space (address from FD00h to FFFFh). The 768 Bytes XRAM can be only accessed by “MOVX” instruction.

### 2.3.3 SFRs

All peripheral functional modules such as I/O ports, Timers and UART operations for the chip are accessed via Special Function Registers (SFRs). These registers occupy upper 128 Bytes of direct Data Memory space locations in the range 80h to FFh. There are 14 bit-addressable SFRs (which means that eight individual bits inside a single byte are addressable), such as ACC, B register, PSW, TCON, SCON, and others. The remaining SFRs are only byte addressable. SFRs provide control and data exchange with the resources and peripherals of the Chip. The TM52 series of microcontrollers provides complete binary code with standard 8051 instruction set compatibility. Beside the standard 8051 SFRs, the Chip implements additional SFRs used to configure and access subsystems such as the ADC/LED/LCD, which are unique to the Chip.

011: Set LVR at 3.2V      111: Set LVR at 4.3V

## 4. Reset

The Chip has five types of reset methods. Resets can be caused by Power on Reset (POR), External Pin Reset (XRST), Software Command Reset (SWRST), Watchdog Timer Reset (WDTR), or Low Voltage Reset (LVR). The CFGWH controls the Reset functionality. The SFRs are returned to their default value after Reset.

### 4.1 Power on Reset

After Power on Reset, the device stays on Reset state for 40 ms as chip warm up time, then downloads the CFGW register from ROM's last six bytes. The Power on Reset needs VCC pin's voltage first discharge to near VSS level, then rise beyond 2.5V.

### 4.2 External Pin Reset

External Pin Reset is active low. It needs to keep at least 2 SRC clock cycle long to be seen by the Chip. External Pin Reset can be disabled or enabled by CFGW.

### 4.3 Software Command Reset

Software Reset is activated by writing the SFR 97h with data 56h.

### 4.4 Watchdog Timer Reset

WDT overflow Reset is disabled or enabled by SFR F7h. The WDT uses SRC as its counting time base. It runs in Fast/Slow mode and runs or stops in Idle/Stop mode. WDT overflow speed can be defined by WDTOSC SFR. WDT is cleared by device Reset or CLRWDT SFR bit.

### 4.5 Low Voltage Reset

The Chip offers 8 options for LVR function. The user can make a selection by CFGWH, let LVR voltages of 4.3V, 4.0V, 3.8V, 3.5V, 3.2V, 2.9V, 2.7V and 2.4V be selected separately.

System Clock frequency	14.7456MHz (-40°C ~85°C)	14.7456MHz (25°C)	7.3728MHz	4MHz	SRC
Minimum LVR level	LVR=3.8V	LVR=3.2V	LVR=2.4V	LVR=2.4V	LVR=2.4V

## 5. Clock Circuitry & Operation Mode

### 5.1 System Clock

The Chip is designed with dual-clock system. During runtime, user can directly switch the System clock from fast to slow or from slow to fast. It also can directly select a clock divider of 1, 2, 4 or 16. The Fast clock can be selected as FXT (Fast Crystal, 1~16 MHz) or FRC (Fast Internal RC, 14.7456 MHz). The Slow clock can be selected as SXT (Slow Crystal, 32 KHz) or SRC (Slow Internal RC, 68 KHz). Fast mode and Slow mode are defined as the CPU running at Fast and Slow clock speeds.

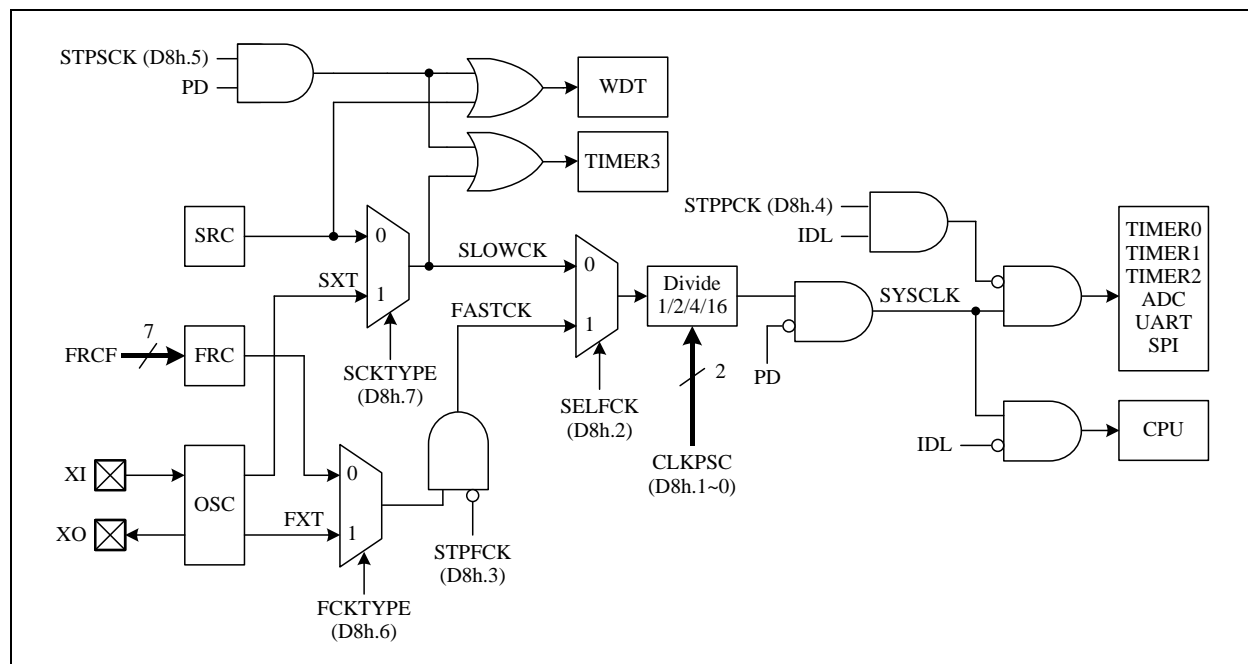

After Reset, the device is running at Slow mode with 68 KHz SRC. S/W should select the proper clock rate for chip operation safety. The higher  $V_{CC}$  allows the chip to run at a higher System clock frequency. In a typical condition, a 16 MHz System clock rate requires  $V_{CC} > 3.3V$ .

The Chip has an external oscillators connected to the XI/XO pins. It relies on external circuitry for the clock signal and frequency stabilization, such as a stand-alone oscillator, quartz crystal, or ceramic resonator. In Fast mode, the fast oscillator can be used in the range from 1~16 MHz. In Slow mode, the slow oscillator can only use a clock frequency of 32.768 KHz.

The **CLKCON** SFR controls the System clock operating. H/W automatically blocks the S/W abnormally setting for this register. S/W can only change the Slow clock type in Fast mode and change the Fast clock type in Slow mode. Never to write both STPFCK=1 & SELFCK=1. It is recommended to write this SFR bit by bit.

**If user wants to switch Fsys from Slow clock to FXT, user should be following the step below**

1. Set FCKTYPE (D8h.6)
2. Wait 2ms until FXT oscillation stable
3. Set SELFCK (D8h.2)

**Clock Structure**

00: System clock is Fast/Slow clock divided by 16  
01: System clock is Fast/Slow clock divided by 4  
10: System clock is Fast/Slow clock divided by 2  
11: System clock is Fast/Slow clock divided by 1

SYSCLK	CLKCON (D8h)			
	bit7 SCKTYPE	bit6 FCKTYPE	bit3 STPFCK	bit2 SELFCK
Fast FXT	0/1	1	0	1
Fast FRC	0/1	0	0	1
Slow SXT	1	0/1	0/1	0
Slow SRC	0	0/1	0/1	0
Fast type change	0/1	0 ← → 1	0/1	0
Slow type change	0 ← → 1	0/1	0	1
Stop FRC/FXT	0/1	0/1	0 → 1	0
Switch to FRC/FXT	0/1	0/1	0	0 → 1
Switch to SRC/SXT	0/1	0/1	0	1 → 0

**Note:** Because of the CLKPSC delay, it needs to wait for 16 clock cycles (max.) before switching Slow clock to Fast clock. Also refer to AP-TM52XXXXX\_01S and AP-TM52XXXXX\_02S about System Clock Application Note.

The chip can also output the "System clock divided by 2" signal (CKO) to P1.4 pin. CKO pin's output setting is controlled by TCOE SFR (*see section 7*).

## 5.2 Operation Modes

There are five operation modes for this device. **Fast Mode** is defined as the CPU running at Fast clock speed. **Slow Mode** is defined as the CPU running at Slow clock speed. When the System clock speed is lower, the power consumption is lower.

**Idle Mode** is entered by setting the IDL bit in PCON SFR. Both Fast and Slow clock can be set as the System clock source in Idle Mode, but Slow clock is better for power saving. In Idle mode, the CPU puts itself to sleep while the on-chip peripherals stay active. The “STPPCK” bit in CLKCON SFR can be set to furthermore reduce Idle mode current. If STPPCK is set, only Timer3 and pin interrupts are alive in Idle Mode, others peripherals such as Timer0/1/2, UARTs and ADC are stop. The slower System clock rate also helps current saving. It can be achieved by setup the CLKPSC SFR to divide System clock frequency. Idle mode is terminated by Reset or enabled Interrupts wake up.

**Stop Mode** is entered by setting the PD bit in PCON SFR and STPSCK is set. This mode is the so-called “Power Down” mode in standard 8051. In Stop mode, all clocks stop except the WDT could be alive if it is enabled. Stop Mode is terminated by Reset or pin wake up.

**Halt Mode** is entered by setting the PD bit in PCON SFR and STPSCK is cleared. In Halt mode, all clocks stop except the Timer3 and WDT could be alive if they are enabled. Halt Mode is terminated by Reset, pin wake up or Timer3 interrupt.

*Note: Chip cannot enter Stop Mode if INTn pin is low and wakeup is enable. (INTn=0 and EXn=1, n=0,1,2)*

*Note: FW must turn off Bandgap to obtain Tiny Current (VBGOUT=0)*

## 6. Interrupt & Wake-up

This Chip has a 12-source four-level priority interrupt structure. All enabled Interrupts can wake up CPU from Idle mode, but only the Pin Interrupts can wake up CPU from Stop mode. Each interrupt source has its own enable control bit. An interrupt event will set its individual Interrupt Flag, no matter whether its interrupt enable control bit is 0 or 1. The Interrupt vectors and flags are list below.

Vector	Flag	Description
0003	IE0	INT0 external pin Interrupt (can wake up Stop mode)
000B	TF0	Timer0 Interrupt
0013	IE1	INT1 external pin Interrupt (can wake up Stop mode)
001B	TF1	Timer1 Interrupt
0023	RI+TI	Serial Port (UART1) Interrupt
002B	TF2+EXF2	Timer2 Interrupt
0033	—	Reserved for ICE mode use
003B	TF3	Timer3 Interrupt
0043	P1IF	Port1 external pin change Interrupt (can wake up Stop mode)
004B	IE2	INT2 external pin Interrupt (can wake up Stop mode)
0053	ADIF+TKIF	ADC/Touch Key Interrupt
005B	SPIF+WCOL+MODF	SPI Interrupt
0063	RI2+TI2	Serial Port (UART2) Interrupt

**Interrupt Vector & Flag**

### 6.1 Interrupt Enable and Priority Control

The IE and INTE1 SFRs decide whether the pending interrupt is serviced by CPU. The P1WKUP SFR controls the individual Port1 pin's wake-up and interrupt capability. The IP, IPH, IP1 and IP1H SFRs decide the interrupt priority. An interrupt will be serviced as long as an interrupt of equal or higher priority is not already being serviced. If an interrupt of equal or higher level priority is being serviced, the new interrupt will wait until it is finished before being serviced. If a lower priority level interrupt is being serviced, it will be stopped and the new interrupt serviced. When the new interrupt is finished, the lower priority level interrupt that was stopped will be completed.

## 6.2 Pin Interrupt

Pin Interrupts include INT0 (P3.2), INT1 (P3.3), INT2 (P3.7) and Port1 Change Interrupt. These pins also have the Stop mode wake up capability. INT0 and INT1 are falling edge or low level triggered as the 8051 standard. INT2 is falling edge triggered and Port1 Change Interrupt is triggered by any Port1 pin state change.

**Pin Interrupt & Wake up**

SFR 88h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>TCON</b>	TF1	TR1	TF0	TR0	IE1	IT1	IE0	IT0

Reset	0	0	0	0	0	0	0	0

- 88h.3 **IE1:** External Interrupt 1 (INT1 pin) edge flag.  
Set by H/W when an INT1 pin falling edge is detected, no matter the EX1 is 0 or 1.  
It is cleared automatically when the program performs the interrupt service routine.
- 88h.2 **IT1:** External Interrupt 1 control bit  
0: Low level active (level triggered) for INT1 pin  
1: Falling edge active (edge triggered) for INT1 pin
- 88h.1 **IE0:** External Interrupt 0 (INT0 pin) edge flag  
Set by H/W when an INT0 pin falling edge is detected, no matter the EX0 is 0 or 1.  
It is cleared automatically when the program performs the interrupt service routine.
- 88h.0 **IT0:** External Interrupt 0 control bit  
0: Low level active (level triggered) for INT0 pin  
1: Falling edge active (edge triggered) for INT0 pin

SFR 95h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>INTFLG</b>	—	—	TKIF	ADIF	—	IE2	P1IF	TF3
R/W	—	—	R/W	R/W	—	R/W	R/W	R/W
Reset	—	—	0	0	—	0	0	0

95h.2 **IE2:** External Interrupt 2 (INT2 pin) edge flag

Set by H/W when a falling edge is detected on the INT2 pin, no matter the EX2 is 0 or 1.

It is cleared automatically when the program performs the interrupt service routine.

S/W can write FBh to INTFLG to clear this bit. (*Note1*)

95h.1 **P1IF:** Port1 pin change interrupt flag

Set by H/W when a Port1 pin state change is detected and its interrupt enable bit is set (P1WKUP).

P1IE does not affect this flag's setting.

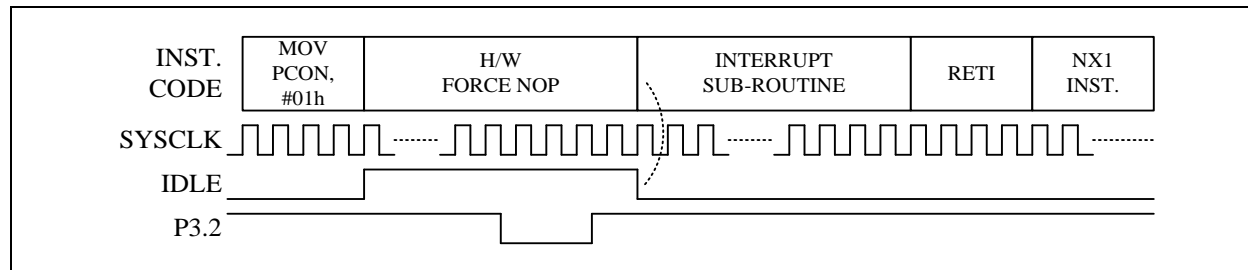

It is cleared automatically when the program performs the interrupt service routine.

S/W can write FDh to INTFLG to clear this bit. (*Note1*)

*Note1:* S/W can write 0 to clear a flag in the INTFLG, but writing 1 has no effect.

### 6.3 Idle mode Wake up and Interrupt

Idle mode is waked up by enabled Interrupts, which means individual interrupt enable bit (ex: EX0) and EA bit must be both set to 1 to establish Idle mode wake up capability. All enabled Interrupts (Pins, Timers, ADC, TK, SPI and UARTs) can wake up CPU from Idle mode. Upon Idle wake-up, Interrupt service routine is entered immediately. "The first instruction behind IDL (PCON.0) setting" is executed after interrupt service routine return.

**EA=EX0=1, Idle mode wake-up and Interrupt by P3.2 (INT0)**

SFR 87h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>PCON</b>	SMOD	—	—	—	GF1	GF0	PD	IDL
R/W	R/W	—	—	—	R/W	R/W	R/W	R/W
Reset	0	—	—	—	0	0	0	0

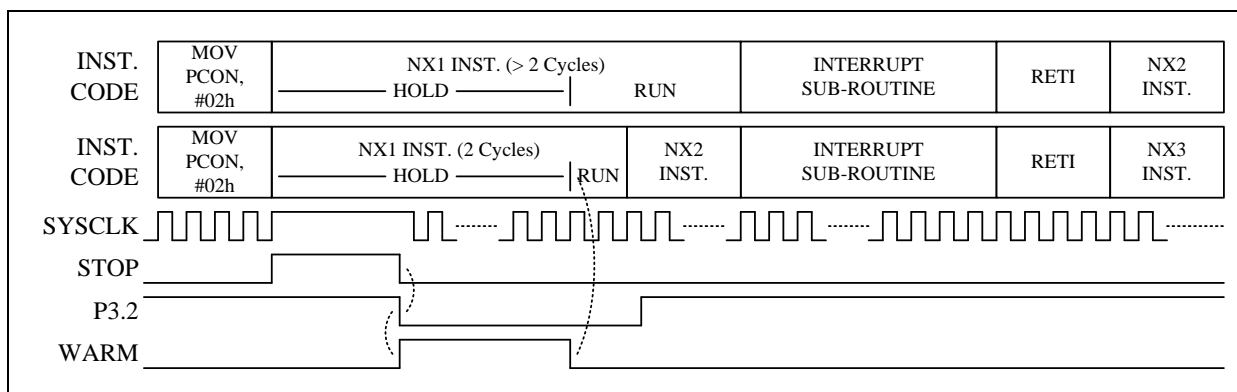

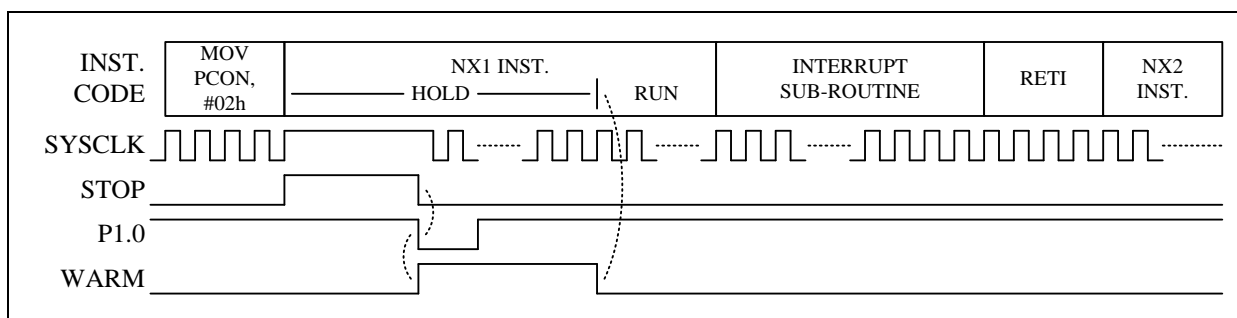

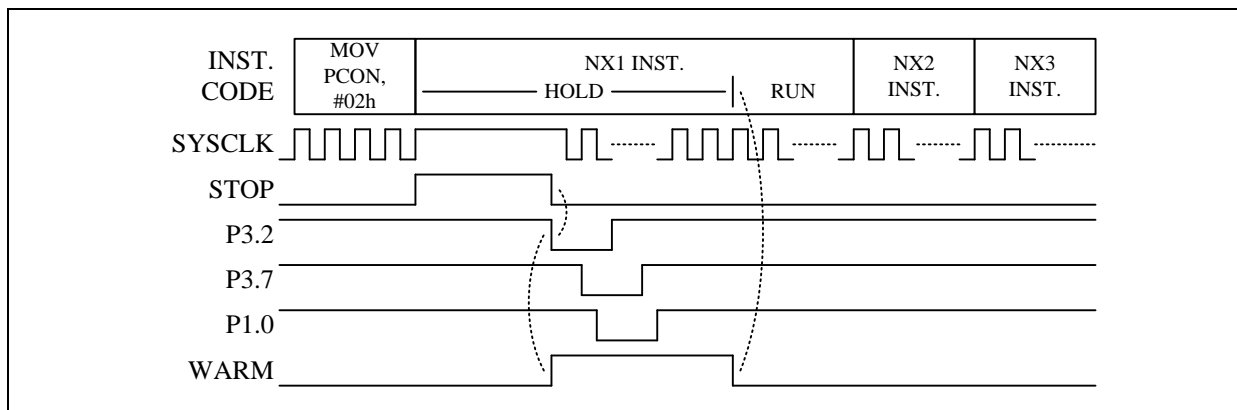

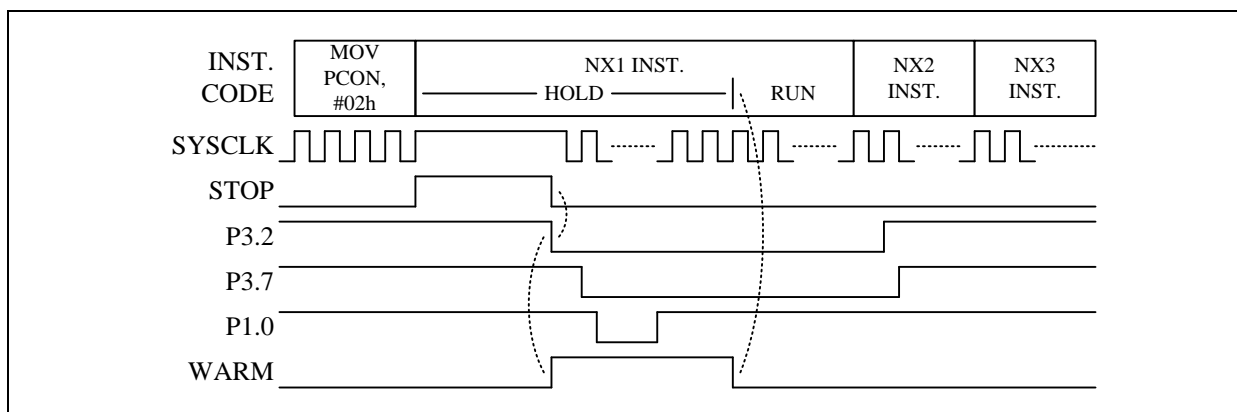

87h.1 **PD:** Power down control bit, set 1 to enter STOP mode.

87h.0 **IDL:** Idle mode control bit, set 1 to enter IDLE mode.

### 6.4 Stop mode Wake up and Interrupt

Stop mode wake up is simple, as long as the individual pin interrupt enable bit (ex: EX0) is set, the pin wake up capability is asserted. Set EX0/EX1/EX2 can enable INT0/INT1/INT2 pins' Stop mode wake up capability. Set P1WKUP bit 7~0 can enable P1.7~P1.0's Stop mode wake up capability. Upon Stop wake up, "the first instruction behind PD setting (PCON.1)" is executed immediately before Interrupt service. Interrupt entry requires EA=1 (P1WKUP also needs P1IE=1) and trigger state of the pin staying sufficiently long to be observed by the System clock. This feature allows CPU to enter or not enter Interrupt sub-routine after Stop mode wake up.

*Note:* It is recommended to place the NX1/NX2 with NOP Instruction in figures below.

**EA=EX0=1, P3.2 (INT0) is sampled after warm-up, Stop mode wake-up and Interrupt**

**EA=P1IE=P1WKUP=1, P1.0 change (not need clock sample), Stop mode wake-up and Interrupt**

**EA=EX0=EX2=P1WKUP=1, P1IE=0, Stop mode wake-up but not Interrupt. P3.2/P3.7 pulse too narrow**

**EX0=EX2=P1WKUP=P1IE=1, EA=0, Stop mode wake-up but not Interrupt**

## 7. I/O Ports

The Chip has total 26 multi-function I/O pins. All I/O pins follow the standard 8051 “Read-Modify-Write” feature. The instructions that read the SFR rather than the Pin State are the ones that read a port or port bit value, possibly change it, and then rewrite it to the SFR (ex: ANL P1, A; INC P2; CPL P3.0).

### 7.1 Port1 & P2.1~P2.0 & Port 3

These pins can operate in four different modes as below.

Mode	Port1, P2.1~P2.0, Port3 pin function		Px.n SFR data	Pin State	Resistor Pull-up	Digital Input
	P3.0~P3.2	Others				
Mode 0	Pseudo Open Drain	Open Drain	0	Drive Low	N	N
			1	Pull-up	Y	Y
Mode 1	Pseudo Open Drain	Open Drain	0	Drive Low	N	N
			1	Hi-Z	N	Y
Mode 2	CMOS Output		0	Drive Low	N	N
			1	Drive High	N	N
Mode 3	Analog input for ADC, digital input buffer is disabled		X (don't care)	—	N	N

**I/O Pin Function Table**

If a Port1, P2.1~P2.0 or Port3 pin is used for Schmitt-trigger input, S/W must set the I/O pin to Mode0 or Mode1 and set the corresponding Port Data SFR to 1 to disable the pin's output driving circuitry.

Beside I/O port function, each Port1, P2.1~P2.0 and Port3 pin has one or more alternative functions, such as LCD, LED, ADC and Touch Key. Most of the functions are activated by setting the individual pin mode control SFR to Mode3. Port1/Port3 pins have standard 8051 auxiliary definition such as INT0/1, T0/1/2, or RXD/TXD. These pin functions need to set the pin mode SFR to Mode0 or Mode1 and keep the P1.n/P3.n SFR at 1.

Pin Name	8051	Wake-up	CKO	ADC	TK	LCD	LED	others	Mode3

			Touch Key Scanning	
	2	X	Touch Key Idling, CMOS Push-Pull	
			Touch Key Scanning	
AD0~AD9	3	X	ADC Channel	ADCHS
PWM0~PWM2	0	X	PWM Open Drain Output with Pull-up	PINMOD PWMCON2
	1	X	PWM Open Drain Output	
	2	X	PWM Output (CMOS Push-Pull)	
SPI Master Mode MISO	1	1	SPI Data Input	SPCON
SPI Master Mode SCK, MOSI	2	X	SPI Clock/Data Output (CMOS Push-Pull)	SPCON
SPI Slave Mode MISO	2	X	SPI Data Output (CMOS Push-Pull)	SPCON
SPI Slave Mode SCK, MOSI	1	1	SPI Clock/Data Input	SPCON
SS	1	1	SPI Chip Selection	SPCON
XI, XO	0	1	Crystal oscillation	CLKCON

**Mode Setting for Port1, P2.1~P2.0, Port3 Alternative Function**

For tables above, a “**CMOS Output**” pin means it can sink and drive at least 4 mA current. It is not recommended to use such pin as input function.

An “**Open Drain**” pin means it can sink at least 4 mA current but only drive a small current (<20  $\mu$ A). It can be used as input or output function and typically needs an external pull up resistor.

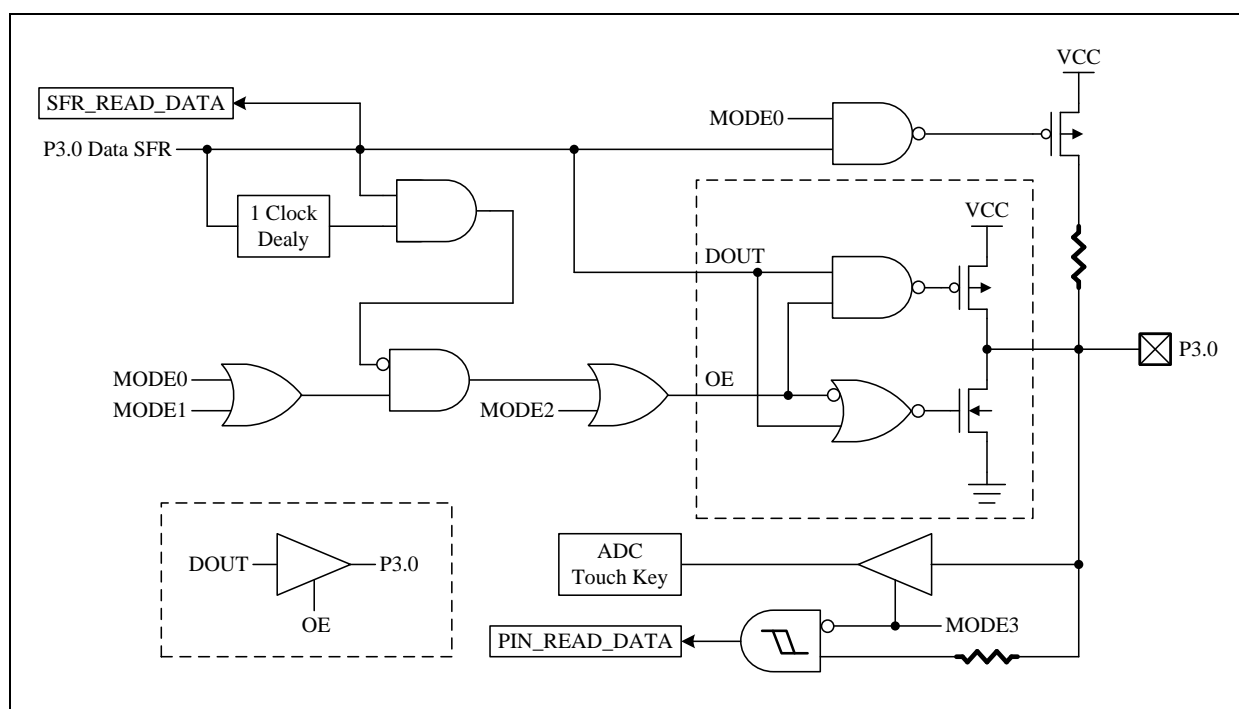

An 8051 standard pin is a “**Pseudo Open Drain**” pin. It can sink at least 4 mA current when output is at low level, and drives at least 4 mA current for 1~2 clock cycle when output transits from low to high, then keeps driving a small current (<20  $\mu$ A) to maintain the pin at high level. It can be used as input or output function.

**Note2:** for the necessary SFR setting above, LCD/LED pin has the highest priority. Therefore, if a pin is not used for Segment (ex: pin is I/O, ADC, TK, and SPI...), S/W must disable the LCD/LED function.

11: LED 1/10 duty (COM0~3, SEG0~5), the LED pins' state will be controlled automatically

## 8. Timers

Timer0, Timer1 and Timer2 are provided as standard 8051 compatible timer/counter. Compare to the traditional 12T 8051, the Chip's Timer0/1/2 use 2 System clock cycle as the time base unit. That is, in timer mode, these timers increase at every “2 System clock” rate; in counter mode, T0/T1/T2 pin input pulse must be wider than 2 System clock to be seen by this device. In addition to the standard 8051 timers function. The T0O pin can output the “Timer0 overflow divided by 64” signal, and the T2O pin can output the “Timer2 overflow divided by 2” signal. Timer3 is provided for a real-time clock count, when its time base is SXT.

### 8.1 Timer0 / Timer1

TCON and TMOD are used to set the mode of operation and to control the running and interrupt generation of the Timer0/1, with the timer/counter values stored in two pairs of 8-bit registers (TL0, TH0, and TL1, TH1).

**Timer0 and Timer1 Structure**

SFR 88h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

**Note:** See also Chapter 6 for more information on Timer2 interrupt enable and priority.

**Note:** See also Chapter 7 for details on T2O pin output settings.

### 8.3 Timer3

Timer3 works as a time-base counter, which generates interrupts periodically. It generates an interrupt flag (TF3) with the clock divided by 32768, 16384, 8192, ..., 256 depending on the TM3PSC SFR. The Timer3 clock source is Slow clock (SRC or SXT). This is ideal for real-time-clock (RTC) functionality when the clock source is SXT.

SFR 95h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>INTFLG</b>	–	–	TKIF	ADIF	–	IE2	P1IF	TF3

**Note:** also refer to Section 6 for more information about Timer3 Interrupt enable and priority.

### 8.4 T0O and T2O Output Control

This device can generate various frequency waveform pin output (in CMOS or Open-Drain format) for Buzzer. The T0O and T2O waveform is divided by Timer0/Timer2 overflow signal. The T0O waveform is Timer0 overflow divided by 64, and T2O waveform is Timer2 overflow divided by 2. User can control their frequency by Timers auto reload speed. Set T0OE and T2OE SFRs can output these waveforms.

SFR A6h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

A6h.0 **T0OE:** Timer0 signal output (T0O) control

- 0: Disable Timer0 overflow divided by 64 output to P3.4
- 1: Enable Timer0 overflow divided by 64 output to P3.4

## 9. UARTs

This Chip has two UARTs, UART1 and UART2.

The **UART1** uses **SCON** and **SBUF** SFRs. **SCON** is the control register, **SBUF** is the data register. Data is written to **SBUF** for transmission and **SBUF** is read to obtain received data. The received data and transmitted data registers are completely independent. In addition to standard 8051's full duplex mode, this chip also provides one wire mode. If the **UART1W** bit is set, both transmit and receive data use P3.1 pin.

The **UART2** uses **SCON2** and **SBUF2** SFRs. **SCON2** is the control register, **SBUF2** is the data register. Data is written to **SBUF2** for transmission and **SBUF2** is read to obtain received data. The received data and transmitted data registers are completely independent. The **UART2** supports most of the functions of **UART**, but it does not support Mode0 and Mode2, it also does not support Timer2 and one wire **UART** mode. On other hand, the option of **SMOD** is not use for **UART2**. **UART2** double baud rate is always enabled.

SFR 87h	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

<b>SBUF2</b>	SBUF2							
R/W	R/W							
Reset	—	—	—	—	—	—	—	—

8Fh.7~0 **SBUF2:** UART2 transmit and receive data. Transmit data is written to this location and receive data is read from this location, but the paths are independent.

$F_{\text{SYSCLK}}$  denotes System clock frequency, the UART baud rate is calculated as below.

- **Mode 0: (UART2 invalid)**  
Baud Rate =  $F_{\text{SYSCLK}}/2$
- **Mode 1, 3:** if using Timer1 auto reload mode  
Baud Rate =  $(\text{SMOD} + 1) \times F_{\text{SYSCLK}} / (32 \times 2 \times (256 - \text{TH1}))$
- **Mode 1, 3:** if using Timer2 (**UART2 invalid**)  
Baud Rate =  $\text{Timer2 overflow rate} / 16 = F_{\text{SYSCLK}} / (32 \times (65536 - \text{RCP2H}, \text{RCP2L}))$
- **Mode 2: (UART2 invalid)**  
Baud Rate =  $(\text{SMOD} + 1) \times F_{\text{SYSCLK}} / 64$

**Note:** also refer to Section 6 for more information about UART Interrupt enable and priority.

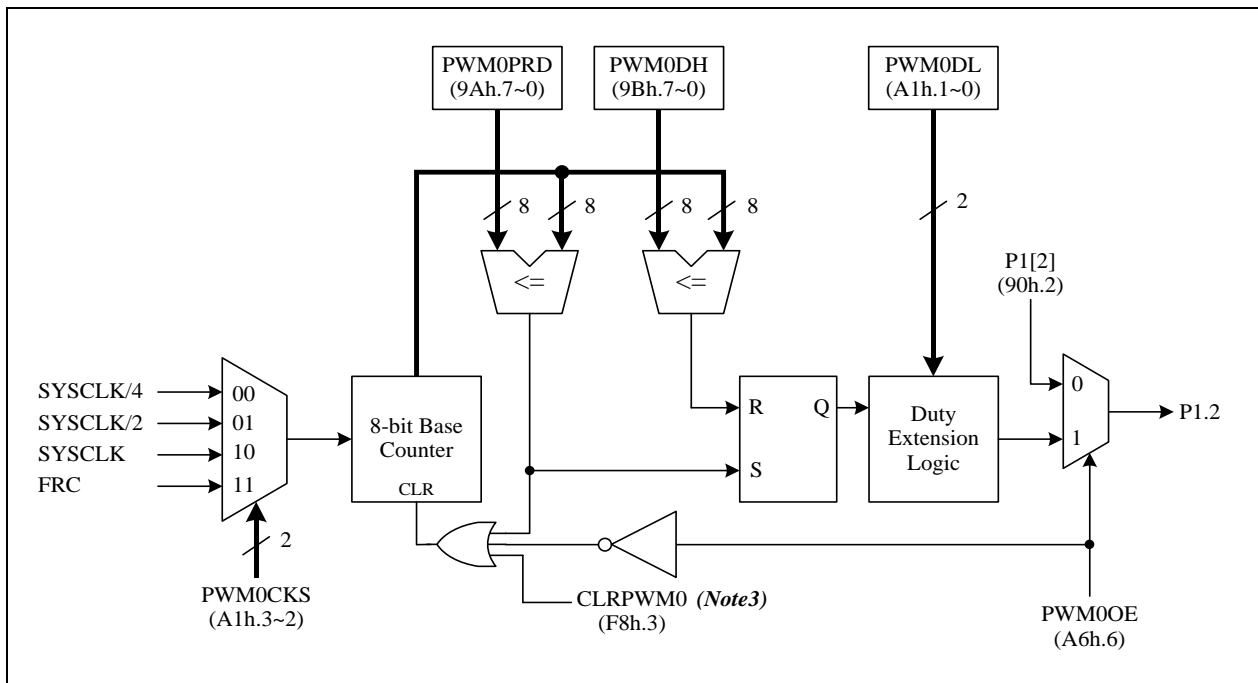

**Note:** also refer to Section 8 for more information about how Timer2 controls UART clock.

## 10. PWMs

The Chip has three independent PWM modules, PWM0, PWM1 and PWM2. The PWM can generate a fixed frequency waveform with 1024 duty resolution on the basis of the PWM clock. The PWM clock can select FRC or  $F_{\text{SYSCLK}}$  divided by 1, 2, or 4 as its clock source. A spread LSB technique allows PWM to run its frequency at the “PWM clock divided by 256” instead of at the “PWM clock divided by 1024”, which means the PWM is four times faster than normal. The advantage of a higher PWM frequency is that the post RC filter can transform the PWM signal to a more stable DC voltage level.

The PWM output signal resets to a low level whenever the 8-bit base counter matches the 8-bit MSB of the PWM duty register. When the base counter rolls over, the 2-bit LSB of the PWM duty register decides whether to set the PWM output signal high immediately or set it high after one clock cycle delay. The PWM period can be set by writing the period value to the 8-bit PWM period register.

The pin mode SFR controls the PWM output waveform format. Mode1 makes the PWM open drain output and Mode2 makes the PWM CMOS push-pull output. (*see section 7*)

**PWM0 Structure**

**Note3:** the PWM1 and PWM2 are almost the same as the PWM0, except they have no clear control bit.

## 11. ADC

The Chip offers a 12-bit ADC consisting of a 16-channel analog input multiplexer, control register, clock generator, 12-bit successive approximation register, and output data register. To use the ADC, set the ADCKS bit first to choose a proper ADC clock frequency, which must be less than 1 MHz. Then, launch the ADC conversion by setting the ADSOC bit, and H/W will automatic clear it at the end of the conversion. After the end of the conversion, H/W will set the ADIF bit and generate an interrupt if an ADC interrupt is enabled. The ADIF bit can be cleared by writing 0 to this bit or 1 to the ADSOC bit. Because certain channels are shared with the Touch Key, the ADC channel must be configured differently from the Touch Key channel to avoid affecting the channel input sensitivity. There are four ADC reference volts ( $V_{REFS}$ ) can be selected by setting ADCVREFS. The analog input level must remain within the range from  $V_{SS}$  to  $V_{REFS}$ .

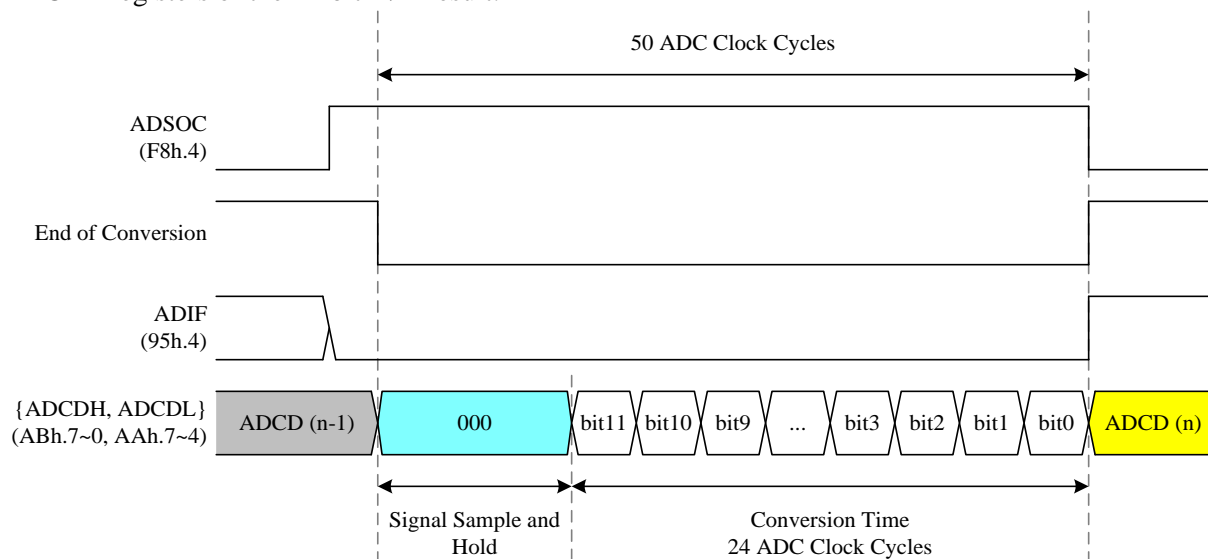

## 11.1 ADC Channels

The 12-bit ADC has a total of 16 channels, designated AD0~AD10, AD12~AD14,  $V_{CC}/4$ , and VBG. The ADC channels are connected to the analog input pins via the analog switch multiplexer. The analog switch multiplexer is controlled by the ADCHS register. The Chip offers up to 14 analog input pins, designated AD0~AD10 and AD12~AD14. In addition, there are two analog input pins for voltage reference connections. When ADCHS is set to 1111b, the analog input will connect to  $V_{CC}/4$ , and when ADCHS is set to 1011b, the analog input will connect to VBG. VBG is an internal voltage reference at 1.22V. After the ADCHS is set, the ADC module is connected to the I/O port through the selection of ADCHS. If the I/O port is used as Touch Key, it will affect the Touch Key function. Therefore, when the ADC is not in use, it is recommended to set the ADCHS to 1111b ( $V_{CC}/4$ ) or 1011b (VBG) to disconnect the ADC module from the I/O port.

## 11.2 ADC Conversion Time

The conversion time is the time required for the ADC to convert the voltage. The ADC requires two ADC clock cycles to convert each bit and several clock cycles to sample and hold the input voltage. A total of 50 ADC clock cycles are required to perform the complete conversion. When the conversion time is complete, the ADIF interrupt flag is set by H/W, and the result is loaded into the ADCDH and ADCDL registers of the 12-bit A/D result.

## 12. Touch Key (FE8276/78 only)

The Touch Key offers an easy, simple and reliable method to implement finger touch detection. The device support 15 channels touch key detection.

To use the Touch Key, user must setup the Pin Mode (*see Section 7*) correctly as below table. Setting Mode2 for an Idling Touch Key pin can CMOS output Low and reduce the mutual interference between the adjacent keys.

P0OEx / P1MODx / P3MODx setting for Touch Key	TK0~TK14
Pin is Touch Key, Idling	Drive Low
Pin is Touch Key, Scanning	

There are two oscillators: Reference Clock (RCK) and Touch Clock (TCK). They are connected to the Reference Counter and Data Counter respectively. The frequency of RCK can be adjusted by setting TKFREQ. Reference Counter is used to control conversion time. From starting touch key conversion to end, it will take 0 to 4096 RCK oscillation cycles by setting TKTMR. After end of conversion, user can get TKDATA (TKDH, TKDL) from Data counter. TKDATA is affected by finger touching. As finger touching TCK is getting slower, the value of TKDATA is smaller than the no finger touching. According to the difference of TKDATA, user can check if it is touched or not. The frequency of TCK will adjust automatically by setting TKFJMP=1, otherwise it can be adjusted by JMPVAL when TKFJMP=0.

**Touch Key Structure**

To start the Scanning, user assigns TKPD=0, then set the TKSOC bit to start touch key conversion, the TKSOC bit can be automatically cleared while end of conversion. However, if the SYSCLK is too slow, H/W might fail to clear TKSOC due to clock sampling rate. TKEOC=0 means conversion is in process. TKEOC=1 means the conversion is finish, and the touch key counting result is stored into the 12 bits TK Data Counter TKDH and TKDL.

When TKPD=0 and TKCHS is set, the Touch Key module is connected to the I/O port through the selection of TKCHS. If the I/O port is used as other functions, it must be affected. Therefore, when the Touch Key module is not in use, it is recommended to set TKPD =1 to disconnect the TK module from the I/O port.

◇ Example:

```

MOV      TKCON,#000h      ; TKPD=0, TKCHS=0 (select TK0)

MOV      TKFREQ,#040h      ; Set an appropriate value for TK scanning

### 13. S/W Controller LCD Driver

The chip supports an S/W controlled method to driving LCD. All of the IO pins can be the Common pins. User can flexibly adjust the Common pins and Segment pins. It is capable of driving the LCD panel with 169 dots (Max.) by 13 Commons (COM) and 13 Segments (SEG). The P0.0~P0.7 are used for Common pins COM00~COM07. The P1.0~P1.7 are used for Common pins COM10~COM17. The P2.0~P2.1 are used for Common pins COM20~COM21. The P3.0~P3.7 are used for Common pins COM30~COM37. Common pins are capable of driving 1/2 bias by setting the corresponding registers P0LOE, P1LOE, P2LOE or P3LOE. Refer to the following figures.

**LCD COM00~07 Circuit**

The frequency of any repeating waveform output on the COM pin can be used to represent the LCD frame rate. The figure below shows an LCD frame.

## 14. LED Controller/Driver

The chip supports a LED controller and driver by Matrix mode of operation. The LED Matrix mode can drive more number of LED pixels than the tradition mode, when they use the same number of pins. In this mode, it provides maximum 10 pins (LEDC0~C3, LEDS0~S5) to drive a LED module with 48 pixels. All 10 pins have a high sink current for driving LED directly. In the other hand, this LED controller also provides 3groups 8-level of brightness adjustment for all 10 pin. It can make the brightness smoother by setting the LEDSMDIS=0. To avoid LED flicker when the common signal is changing, the chip provides a dead time control. In the dead time period, segment pins will output a short inactive signal instead of changing the signal immediately. To start the LED scanning, it only has to set the LEDEN. Then H/W will control the Pin mode automatically. It also provides the scan hold function by setting LEDHOLD.

LEDEN	Duty	Matrix	Max pixels
0	Disable	-	-
1	1/8	4COM x 4SEG	32 (4x4x2)
2	1/9	4COM x 5SEG	40 (4x5x2)
3	1/10	4COM x 6SEG	48 (4x6x2)

## 15. Serial Peripheral Interface (SPI)

The Serial Peripheral Interface (SPI) module is capable of full-duplex, synchronous, serial communication between the MCU and peripheral devices. The peripheral devices can be other MCUs, A/D converter, sensors, or flash memory, etc. The SPI runs at a clock rate up to the system clock divided by two. Firmware can read the status flags, or the operation can be interrupt driven. Following figure shows the SPI system block diagram.

The features of the SPI module include:

- Master or Slave mode operation
- 3-wire or 4-wire mode operation
- Full-duplex operation
- Programmable transmit bit rate
- Single buffer receive
- Serial clock phase and polarity options
- MSB-first or LSB-first shifting selectable

SPI Function Pin	P1/P3 Mode	P1.n/P3.n SFR data
Master Mode, MISO	Mode1	1
Master Mode, SCK, MOSI	Mode2	X
Slave Mode, MISO	Mode2	X
Slave Mode, SCK, MOSI	Mode1	1
SS	Mode1	1

**Pin Mode Setting for SPI**

The four signals used by SPI are described below. The MOSI (P3.5) signal is an output from a Master Device and an input to Slave Devices. The signal is an output when SPI is operating in Master mode and an input when SPI is operating in Slave mode. The MISO (P1.7) signal is an output from a Slave Device and an input to a Master Device. The signal is an input when SPI is operating in Master mode and an output when SPI is operating in Slave mode. Data is transferred most-significant bit (MSB) or least-significant bit (LSB) first by setting the LSBF bit. The SCK (P3.6) signal is an output from a Master Device and an input to Slave Devices. It is used to synchronize the data on the MOSI and MISO lines of Master and Slave. SPI generates the signal with eight programmable clock rates in Master mode. The SS (P3.4) signal is a low active slave select pin. In 4-wire Slave mode, the signal is ignored when the Slave is not selected (SS=1). The SS is ignored when the SSDIS in SPCON is set in both Master and Slave modes. In Slave mode and the SSDIS is clear, the SPI active when SS stay low. For multiple-slave mode, only one slave device is selected at a time to avoid bus collision on the MISO line. In Master mode and the SSDIS is cleared, the MODF in SPSTA is set when this signal is low. For multiple-master mode, enable SS line to avoid multiple driving on MOSI and SCK lines from multiple masters.

### Master Mode

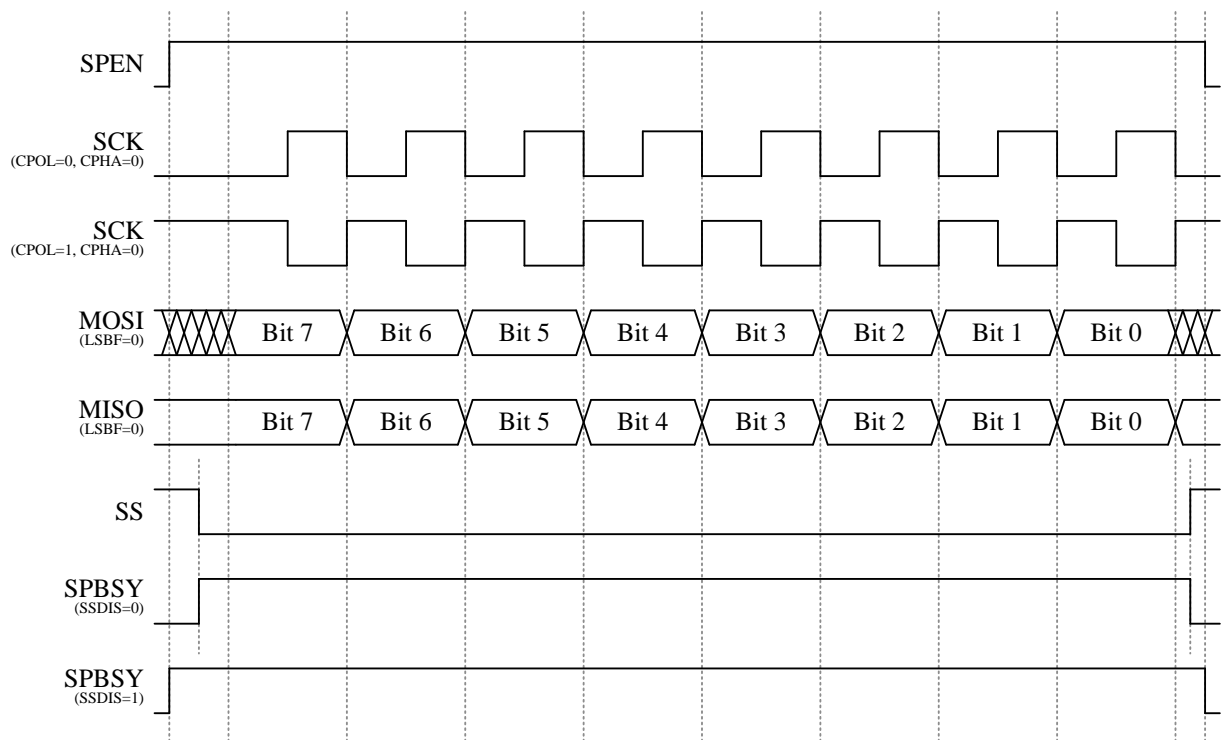

The SPI operates in Master mode by setting the MSTR bit in the SPCON. To start transmit, writing a data to the SPDAT. If the SPBSY bit is cleared, the data will be transferred to the shift register and starts shift out on the MOSI line. The data of the slave shift in from the MISO line at the same time. When the SPIF bit in the SPSTA becomes set at the end of the transfer, the receive data is written to receiver buffer and the RCVBF bit in the SPSTA is set. To prevent an overrun condition, software must read the SPDAT before next byte enters the shift register. The SPBSY bit will be set when writing a data to SPDAT to start transmit, and be cleared at the end of the eighth SCK period in Master mode.

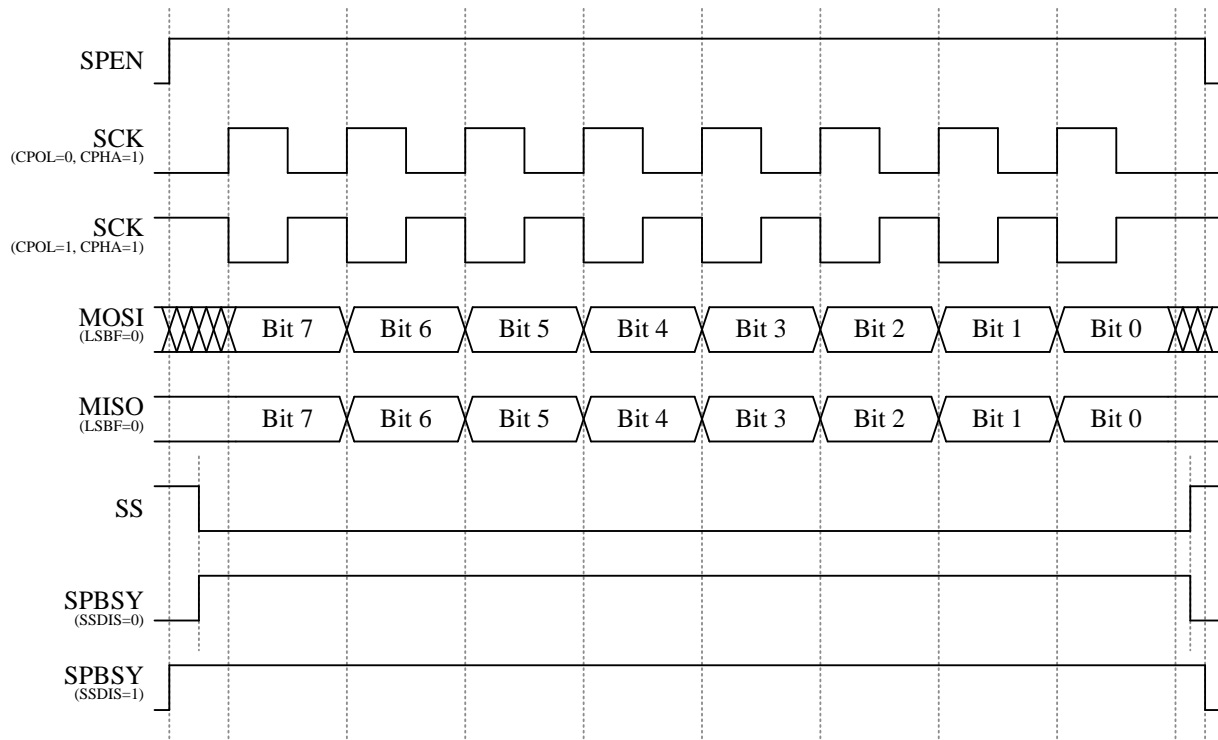

### Slave Mode

The SPI operates in Slave mode by clearing the MSTR bit in the SPCON. If the SSDIS is cleared, the transmission will start when the SS become low and remain low until the end of a data transfer. If the SSDIS is set, the transmission will start when the SPEN bit in the SPCON is set, and don't care the SS. The data from a master will shift into the shift register through the MOSI line, and shift out from the shift register on the MISO line. When a byte enters the shift register, the data will be transferred to receiver buffer if the RCVBF is cleared. If the RCVBF is set, the newer receive data will not be transferred to receiver buffer and the RCVOVF bit is set. After a byte enters the shift register, the SPIF and RCVBF bits are set. To prevent an overrun condition, software must read the SPDAT or write 0 to RCVBF before next byte enters the shift register. The maximum SCK frequency allowed in Slave mode is  $F_{\text{SYSCLK}}/4$ . In Slave mode, the SPBSY bit refers to the SS pin when the SSDIS bit is cleared, and refer to the SPEN bit when SSDIS bit is set.

### Serial Clock

The SPI has four clock types by setting the CPOL and CPHA bits in the SPCON register. The CPOL bit defines the level of the SCK in SPI idle state. The level of the SCK in idle state is low when the CPOL bit is cleared, and is high when the CPOL bit is set. The CPHA bit defines the edges used to sample and shift data. The SPI sample data on the first edge of SCK period and shift data on the second edge of SCK period when the CPHA bit is cleared. The SPI sample data on the second edge of SCK period and shift data on first edge of SCK period when the CPHA bit is set. The figures below show the detail timing in Master and Slave modes. Both Master and Slave devices must be configured to use the same clock type before the SPEN bit is set. The SPCR controls the Master mode serial clock frequency. This register is ignored when operating in Slave mode. The SPI clock can select System clock divided by 2, 4, 8, or 16 in Master mode.

**Master Mode Timing**

**Slave Mode Timing (CPHA=0)**

**Slave Mode Timing (CPHA=1)**

In both Master and Slave modes, the SPIF bit is set by H/W at the end of a data transfer and generates an interrupt if SPI interrupt is enabled. The SPIF bit is cleared automatically when the program performs the interrupt service routines. S/W can also write 0 to clear this flag. If write data to SPDAT when the SPBSY is set, the WCOL bit will be set by H/W and generates an interrupt if SPI interrupt is enabled. When this occurs, the data write to SPDAT will be ignored, and shift register will not be written. Write 0 to this bit or when SPBSY is cleared and rewrite data to SPDAT will clear this flag. The MODF bit is set when SSDIS is cleared and SS pin is pulled low in Master mode. If SPI interrupt is enabled, an interrupt will be generated. When this bit is set, the SPEN and MSTR in SPCON will be cleared by H/W. Write 0 to this bit will clear this flag.

Reset	0	0	0	0	0	0	—	—

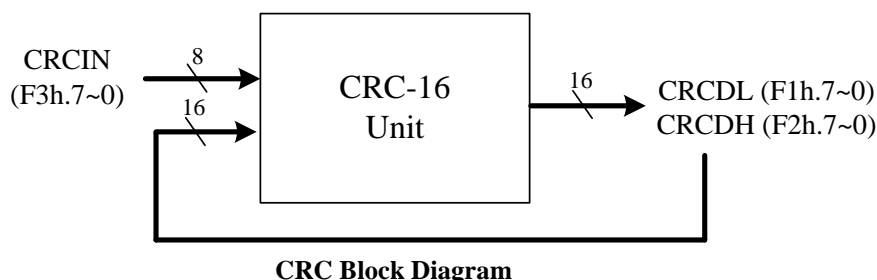

- BDh.7 **SPIF**: SPI interrupt flag  
 This is set by H/W at the end of a data transfer. Cleared by H/W when an interrupt is vectored into. Writing 0 to this bit will clear this flag.
- BDh.6 **WCOL**: Write collision interrupt flag  
 Set by H/W if write data to SPDAT when SPBSY is set. Write 0 to this bit or rewrite data to SPDAT when SPBSY is cleared will clear this flag.
- BDh.5 **MODF**: Mode fault interrupt flag  
 Set by H/W when SSDIS is cleared and SS pin is pulled low in Master mode. Write 0 to this bit will clear this flag. When this bit is set, the SPEN and MSTR in SPCON will be cleared by H/W.
- BDh.4 **RCVOVF**: Received buffer overrun flag  
 Set by H/W at the end of a data transfer and RCVBF is set. Write 0 to this bit or read SPDAT register will clear this flag.
- BDh.3 **RCVBF**: Receive buffer full flag  
 Set by H/W at the end of a data transfer. Write 0 to this bit or read SPDAT register will clear this flag.
- BDh.2 **SPBSY**: SPI busy flag  
 Set by H/W when a SPI transfer is in progress.

SFR BEh	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
<b>SPDAT</b>	SPDAT							
R/W	R/W							
Reset	0	0	0	0	0	0	0	0

- BEh.7~0 **SPDAT**: SPI transmit and receive data  
 The SPDAT register is used to transmit and receive data. Writing data to SPDAT place the data into shift register and start a transfer when in master mode. Reading SPDAT returns the contents of the receive buffer.

## 16. Cyclic Redundancy Check (CRC)

The chip supports an integrated 16-bit Cyclic Redundancy Check function. The Cyclic Redundancy Check (CRC) calculation unit is an error detection technique test algorithm and uses to verify data transmission or storage data correctness. The CRC calculation takes a 8-bit data stream or a block of data as input and generates a 16-bit output remainder. The data stream is calculated by the same generator polynomial.

The CRC generator provides the 16-bit CRC result calculation based on the CRC-16-IBM polynomial. In this CRC generator, there are only one polynomial available for the numeric values calculation. It can't support the 16-bit CRC calculations based on any other polynomials. Each write operation to the CRCIN register creates a combination of the previous CRC value stored in the CRCDH and CRCDL registers. It will take one MCU instruction cycle to calculate.

**CRC-16-IBM (Modbus) Polynomial representation:  $X^{16} + X^{15} + X^2 + 1$**

## 17. In Circuit Emulation (ICE) Mode

This device can support the In Circuit Emulation Mode. To use the ICE Mode, user just needs to connect P3.0 and P3.1 pin to the tenx proprietary EV Module. The benefit is that user can emulate the whole system without changing the on board target device. But there are some limits for the ICE mode as below.

1. The device must be un-protect.
2. The device's P3.0 and P3.1 pins must work in input Mode (P3MOD0 = 0/1 and P3MOD1=0/1).
3. The Program Memory's addressing space 2D00h~2FFFh and 0033h~003Ah are occupied by tenx EV module. So user Program cannot access these spaces.
4. The T-Link communication pin's function cannot be emulated.
5. The P3.0 and P3.1 pin's can be replaced by P0.0 and P0.1.

81h	<b>SP</b>	7~0	SP	R/W	07h	Stack Point
82h	<b>DPL</b>	7~0	DPL	R/W	00h	Data Point low byte
83h	<b>DPH</b>	7~0	DPH	R/W	00h	Data Point high byte
87h	<b>PCON</b>	7	SMOD	R/W	0	Set 1 to enable UART1 double baud rate
		3	GF1	R/W	0	General purpose flag bit
		2	GF0	R/W	0	General purpose flag bit
		1	PD	R/W	0	Power down control bit, set 1 to enter STOP mode
		0	IDL	R/W	0	Idle control bit, set 1 to enter IDLE mode
88h	<b>TCON</b>	7	TF1	R/W	0	Timer1 overflow flag Set by H/W when Timer/Counter 1 overflows. Cleared by H/W when CPU vectors into the interrupt service routine.
		6	TR1	R/W	0	Timer1 run control. 1: timer runs; 0: timer stops
		5	TF0	R/W	0	Timer0 overflow flag Set by H/W when Timer/Counter 0 overflows. Cleared by H/W when CPU vectors into the interrupt service routine.
		4	TR0	R/W	0	Timer0 run control. 1:timer runs; 0:timer stops
		3	IE1	R/W	0	External Interrupt 1 (INT1 pin) edge flag Set by H/W when an INT1 pin falling edge is detected. Cleared by H/W when CPU vectors into the interrupt service routine.
		2	IT1	R/W	0	External Interrupt 1 control bit 0: Low level active (level triggered) for INT1 pin 1: Falling edge active (edge triggered) for INT1 pin
		1	IE0	R/W	0	External Interrupt 0 (INT0 pin) edge flag Set by H/W when an INT0 pin falling edge is detected. Cleared by H/W when CPU vectors into the interrupt service routine.
		0	IT0	R/W	0	External Interrupt 0 control bit 0: Low level active (level triggered) for INT0 pin 1: Falling edge active (edge triggered) for INT0 pin
89h	<b>TMOD</b>	7	GATE1	R/W	0	Timer1 gating control bit 0: Timer1 enable when TR1 bit is set 1: Timer1 enable only while the INT1 pin is high and TR1 bit is set
		6	CT1N	R/W	0	Timer1 Counter/Timer select bit 0: Timer mode, Timer1 data increases at 2 System clock cycle rate 1: Counter mode, Timer1 data increases at T1 pin's negative edge
		5~4	TMOD1	R/W	00	Timer1 mode select 00: 8-bit timer/counter (TH1) and 5-bit prescaler (TL1) 01: 16-bit timer/counter 10: 8-bit auto-reload timer/counter (TL1). Reloaded from TH1 at overflow. 11: Timer1 stops
		3	GATE0	R/W	0	Timer0 gating control bit 0: Timer0 enable when TR0 bit is set 1: Timer0 enable only while the INT0 pin is high and TR0 bit is set
		2	CT0N	R/W	0	Timer0 Counter/Timer select bit 0: Timer mode, Timer0 data increases at 2 System clock cycle rate 1: Counter mode, Timer0 data increases at T0 pin's negative edge
		1~0	TMOD0	R/W	00	Timer0 mode select 00: 8-bit timer/counter (TH0) and 5-bit prescaler (TL0) 01: 16-bit timer/counter 10: 8-bit auto-reload timer/counter (TL0). Reloaded from TH0 at overflow. 11: TL0 is an 8-bit timer/counter. TH0 is an 8-bit timer/counter using Timer1's TR1 and TF1 bits.
8Ah	<b>TL0</b>	7~0	TL0	R/W	00h	Timer0 data low byte
8Bh	<b>TL1</b>	7~0	TL1	R/W	00h	Timer1 data low byte
8Ch	<b>TH0</b>	7~0	TH0	R/W	00h	Timer0 data high byte
8Dh	<b>TH1</b>	7~0	TH1	R/W	00h	Timer1 data high byte

Adr	SFR	Bit#	Bit Name	R/W	Rst	Description
8Eh	<b>SCON2</b>	7	SM	R/W	0	UART2 Serial port mode select bit 0: Mode1: 8 bit UART2, Baud Rate is variable 1: Mode3: 9 bit UART2, Baud Rate is variable
		4	REN2	R/W	0	UART2 reception enable 0: Disable reception 1: Enable reception
		3	TB82	R/W	0	Transmit Bit 8, the ninth bit to be transmitted in Mode3
		2	RB82	R/W	0	Receive Bit 8, contains the ninth bit that was received in Mode3
		1	TI2	R/W	0	Transmit interrupt flag Set by H/W at the beginning of the stop bit in Mode 1 & 3. Must be cleared by S/W.
		0	RI2	R/W	0	Receive interrupt flag Set by H/W at the sampling point of the stop bit in Mode 1 & 3. Must be cleared by S/W.
8Fh	<b>SBUF2</b>	7~0	SBUF2	R/W	–	UART2 transmit and receive data. Transmit data is written to this location and receive data is read from this location, but the paths are independent.
90h	<b>P1</b>	7~0	P1	R/W	FFh	Port1 data
91h	<b>P0OE</b>	7~0	P0OE	R/W	00h	Port0 CMOS Push-Pull output enable control 0: Disable 1: Enable
92h	<b>P0LOE</b>	7~0	P0LOE	R/W	00h	Port0 LCD 1/2 bias output enable control 0: Disable 1: Enable
93h	<b>P2MOD</b>	3~2	P2MOD1	R/W	01	P2.1 Pin Control 00: Mode0; 01: Mode1; 10: Mode2 11: not defined
		1~0	P2MOD0	R/W	01	P2.0 Pin Control 00: Mode0; 01: Mode1; 10: Mode2 11: not defined
94h	<b>OPTION</b>	7	UART1W	R/W	0	Set 1 to enable one wire UART1 mode, both TXD/RXD use P3.1 pin.
		5~4	WDTPSC	R/W	00	Watchdog Timer pre-scalar time select 00: 480ms WDT overflow rate 01: 240ms WDT overflow rate 10: 120ms WDT overflow rate 11: 60ms WDT overflow rate
		3~2	ADCKS	R/W	00	ADC clock rate select 00: F <sub>SYSClk</sub> /32 01: F <sub>SYSClk</sub> /16 10: F <sub>SYSClk</sub> /8 11: F <sub>SYSClk</sub> /4
95h	<b>INTFLG</b>	5	TKIF	R/W	0	Touch Key Interrupt Flag Set by H/W at the end of TK conversion if SYSClk is fast enough. S/W writes DFh to INTFLG or sets the TKSOC bit to clear this flag.
		4	ADIF	R/W	0	ADC interrupt flag Set by H/W at the end of ADC conversion. S/W writes EFh to INTFLG or sets the ADSOC bit to clear this flag.
		2	IE2	R/W	0	External Interrupt 2 (INT2 pin) edge flag Set by H/W when a falling edge is detected on the INT2 pin, no matter the EX2 is 0 or 1. It is cleared automatically when the program performs the interrupt service routine. S/W can write FBh to INTFLG to clear this bit.
		1	P1IF	R/W	0	Port1 pin change Interrupt flag Set by H/W when a Port1 pin state change is detected and its interrupt enable bit is set (P1WKUP). P1IE does not affect this flag's setting. It is cleared automatically when the program performs the interrupt service routine. S/W can write FDh to INTFLG to clear this bit.
		0	TF3	R/W	0	Timer3 Interrupt Flag Set by H/W when Timer3 reaches TM3PSC setting cycles. It is cleared automatically when the program performs the interrupt service routine. S/W can write FEh to INTFLG to clear this bit.

Adr	SFR	Bit#	Bit Name	R/W	Rst	Description
96h	<b>P1WKUP</b>	7~0	P1WKUP	R/W	00h	P1.7~P1.0 pin individual Wake-up/Interrupt enable control 0: Disable; 1: Enable.
97h	<b>SWCMD</b>	7~0	SWRST	W		Write 56h to generate S/W Reset
		7~0	IAPALL	W		Write 65h to set IAPALL control flag; Write other value to clear IAPALL flag. It is recommended to clear it immediately after IAP access.
		1	WDTO	R	0	WatchDog Time-Out flag
		0	IAPALL	R	0	Flag indicates Flash memory sectors can be accessed by IAP or not. This bit combines with MVCLOCK to define the accessible IAP area.
98h	<b>SCON</b>	7	SM0	R/W	0	UART1 Serial port mode select bit 0, 1 (SM0, SM1) = 00: Mode0: 8 bit shift register, Baud Rate=F <sub>SYSClk</sub> /2 01: Mode1: 8 bit UART1, Baud Rate is variable 10: Mode2: 9 bit UART1, Baud Rate=F <sub>SYSClk</sub> /32 or /64 11: Mode3: 9 bit UART1, Baud Rate is variable
		6	SM1	R/W	0	
		5	SM2	R/W	0	Serial port mode select bit 2 SM2 enables multiprocessor communication over a single serial line and modifies the above as follows. In Modes 2 & 3, if SM2 is set then the received interrupt will not be generated if the received ninth data bit is 0. In Mode 1, the received interrupt will not be generated unless a valid stop bit is received. In Mode 0, SM2 should be 0.
		4	REN	R/W	0	Set 1 to enable UART1 Reception
		3	TB8	R/W	0	Transmitter bit 8, ninth bit to transmit in Modes 2 and 3
		2	RB8	R/W	0	Receive Bit 8, contains the ninth bit that was received in Mode 2 and 3 or the stop bit is Mode 1 if SM2=0
		1	TI	R/W	0	Transmit Interrupt flag Set by H/W at the end of the eighth bit in Mode 0, or at the beginning of the stop bit in other modes. Must be cleared by S/W
		0	RI	R/W	0	Receive Interrupt flag Set by H/W at the end of the eighth bit in Mode 0, or at the sampling point of the stop bit in other modes. Must be cleared by S/W.
99h	<b>SBUF</b>	7~0	SBUF	R/W	–	UART1 transmit and receive data. Transmit data is written to this location and receive data is read from this location, but the paths are independent.

Adr	SFR	Bit#	Bit Name	R/W	Rst	Description
		5	MODF	R/W	0	Mode fault interrupt flag Set by H/W when SSDIS is cleared and SS pin is pulled low in Master mode. Write 0 to this bit will clear this flag. When this bit is set, the SPEN and MSTR in SPCON will be cleared by H/W.
		4	RCVOVF	R/W	0	Received buffer overrun flag Set by H/W at the end of a data transfer and RCVBF is set. Write 0 to this bit or read SPDAT register will clear this flag.
		3	RCVBF	R/W	0	Receive buffer full flag Set by H/W at the end of a data transfer. Write 0 to this bit or read SPDAT register will clear this flag.
		2	SPBSY	R	0	SPI busy flag Set by H/W when a SPI transfer is in progress.
BEh	SPDAT	7~0	SPDAT	R/W	0	SPI transmit and receive data The SPDAT register is used to transmit and receive data. Writing data to SPDAT place the data into shift register and start a transfer when in master mode. Reading SPDAT returns the contents of the receive buffer.
C8h	T2CON	7	TF2	R/W	0	Timer2 overflow flag Set by H/W when Timer/Counter 2 overflows unless RCLK=1 or TCLK=1. This bit must be cleared by S/W.
		6	EXF2	R/W	0	T2EX interrupt pin falling edge flag Set when a capture or a reload is caused by a negative transition on T2EX pin if EXEN2=1. This bit must be cleared by S/W.
		5	RCLK	R/W	0	UART receive clock control bit 0: Use Timer1 overflow as receive clock for serial port in mode 1 or 3 1: Use Timer2 overflow as receive clock for serial port in mode 1 or 3
		4	TCLK	R/W	0	UART transmit clock control bit 0: Use Timer1 overflow as transmit clock for serial port in mode 1 or 3 1: Use Timer2 overflow as transmit clock for serial port in mode 1 or 3
		3	EXEN2	R/W	0	T2EX pin enable 0: T2EX pin disable 1: T2EX pin enable, it cause a capture or reload when a negative transition on T2EX pin is detected if RCLK=TCLK=0
		2	TR2	R/W	0	Timer2 run control 0: timer stops 1: timer runs
		1	CT2N	R/W	0	Timer2 Counter/Timer select bit 0: Timer mode, Timer2 data increases at 2 System clock cycle rate 1: Counter mode, Timer2 data increases at T2 pin's negative edge
		0	CPRL2N	R/W	0	Timer2 Capture/Reload control bit 0: Reload mode, auto-reload on Timer2 overflows or negative transitions on T2EX pin if EXEN2=1. 1: Capture mode, capture on negative transitions on T2EX pin if EXEN2=1. If RCLK=1 or TCLK=1, CPRL2N is ignored and timer is forced to auto-reload on Timer2 overflow.
C9h	IAPWE	7~0	IAPWE	W	–	Write 47h to set IAPWE control flag; Write other value to clear IAPWE and EEPWE flag. It is recommended to clear it immediately after IAP write.
		7~0	EEPWE	W	–	Write E2h to set EEPWE control flag; Write other value to clear IAPWE and EEPWE flag. It is recommended to clear it immediately after EEPROM write.
		7	IAPWE	R	0	Flag indicates Flash memory can be written by IAP or not 0: IAP Write disable 1: IAP Write enable
		6	IAPTO	R	0	IAP (or EEPROM write) Time-Out flag Set by H/W when IAP (or EEPROM write) Time-out occurs. Cleared by H/W when IAPWE=0 (or EEPWE=0).
		5	EEPWE	R	0	Flag indicates EEPROM memory can be written or not 0: EEPROM Write disable 1: EEPROM Write enable

## INSTRUCTION SET

Instructions are 1, 2 or 3 bytes long as listed in the 'byte' column below. Each instruction takes 1~8 System clock cycles to execute as listed in the 'cycle' column below.

ARITHMETIC				
Mnemonic	Description	byte	cycle	opcode
ADD A,Rn	Add register to A	1	2	28-2F

<b>MISCELLANEOUS</b>				
<b>Mnemonic</b>	<b>Description</b>	<b>byte</b>	<b>cycle</b>	<b>opcode</b>
NOP	No operation	1	2	00

In the above table, an entry such as E8-EF indicates a continuous block of hex opcodes used for 8 different registers, the register numbers of which are defined by the lowest three bits of the corresponding code. Non-continuous blocks of codes, shown as 11-F1 (for example), are used for absolute jumps and calls with the top 3 bits of the code being used to store the top three bits of the destination address.

## ELECTRICAL CHARACTERISTICS

### 1. Absolute Maximum Ratings ( $T_A=25^{\circ}\text{C}$ )

Parameter	Rating	Unit
Supply voltage	$V_{SS}-0.3 \sim V_{SS}+5.5$	V
Input voltage	$V_{SS}-0.3 \sim V_{CC}+0.3$	
Output voltage	$V_{SS}-0.3 \sim V_{CC}+0.3$	
Output current high per all PIN	-80	mA
Output current low per all PIN	+150	
Maximum Operating Voltage	5.5	V
Operating temperature	$-40 \sim +85$	$^{\circ}\text{C}$
Storage temperature	$-65 \sim +150$	

**2. DC Characteristics** ( $T_A=25\text{ }^{\circ}\text{C}$ ,  $V_{CC}=2.4\text{V} \sim 5.5\text{V}$ )

Parameter	Symbol	Conditions		Min	Typ	Max	Unit
Operating Voltage	$V_{CC}$	$F_{SYSCLK}=14.7456\text{ MHz}$		3.2	—	5.5	V
		$F_{SYSCLK}=7.3728\text{ MHz}$		2.4	—	5.5	
		$F_{SYSCLK}=3.6864\text{ MHz}$		2.4	—	5.5	
Input High Voltage	$V_{IH}$	All Input	$V_{CC}=5\text{V}$	$0.6V_{CC}$	—	—	V
			$V_{CC}=3\text{V}$	$0.6V_{CC}$	—	—	V
Input Low Voltage	$V_{IL}$	All Input	$V_{CC}=5\text{V}$	—	—	$0.2V_{CC}$	V
			$V_{CC}=3\text{V}$	—	—	$0.2V_{CC}$	V
I/O Port Source Current	$I_{OH}$	All Output	$V_{CC}=5\text{V}$ , $V_{OH}=0.9V_{CC}$	5	10	—	mA
			$V_{CC}=3\text{V}$ , $V_{OH}=0.9V_{CC}$	2.5	5	—	
I/O Port Sink Current	$I_{OL}$	All Output,	$V_{CC}=5\text{V}$ , $V_{OL}=0.1V_{CC}$	64	80	—	mA
			$V_{CC}=3\text{V}$ , $V_{OL}=0.1V_{CC}$	32	40	—	
Supply Current	$I_{DD}$	FAST mode $V_{CC}=5\text{V}$	$FXT=16\text{ MHz}$	—	6	—	mA
			$FRC=14.7456\text{ MHz}$	—	5.9	—	
			$FXT=8\text{ MHz}$	—	4	—	
			$FRC=7.3728\text{ MHz}$	—	3.8	—	
		FAST mode $V_{CC}=3\text{V}$	$FXT=16\text{ MHz}$	—	3.6	—	
			$FRC=14.7456\text{ MHz}$	—	3.5	—	
			$FXT=8\text{ MHz}$	—	2.5	—	
			$FRC=7.3728\text{ MHz}$	—	2.4	—	
		SLOW mode	$V_{CC}=3\text{V}$	—	1.2	—	$\mu\text{A}$
			$V_{CC}=5\text{V}$	—	1.8	—	
		IDLE mode $PWRS\Delta V=1$	$SRC, V_{CC}=5\text{V}$	—	20	—	
			$SRC, V_{CC}=3\text{V}$	—	10	—	
		IDLE mode $PWRS\Delta V=0$	$SRC, V_{CC}=5\text{V}$	—	60	—	
			$SRC, V_{CC}=3\text{V}$	—	45	—	
		STOP mode	$V_{CC}=5\text{V}$	—	0.1	—	
			$V_{CC}=3\text{V}$	—	0.1	—	
		Halt mode	$V_{CC}=5\text{V}$	—	5	—	
			$V_{CC}=3\text{V}$	—	2	—	
System Clock Frequency	$F_{SYSCLK}$	$V_{CC} > LVR_{TH}$	$V_{CC}=3.2\text{V}$	—	—	14.7456	MHz
			$V_{CC}=2.4\text{V}$	—	—	7.3728	
			$V_{CC}=2.4\text{V}$	—	—	4	
LVR Reference Voltage	$V_{LVR}$	$T_A=25^{\circ}\text{C}$		—	4.3	—	V
				—	4.0	—	
				—	3.8	—	
				—	3.5	—	
				—	3.2	—	
				—	2.9	—	
				—	2.7	—	
				—	2.4	—	

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
LVR Hysteresis Voltage	$V_{HYST}$	$T_A=25^{\circ}\text{C}$	–	$\pm 0.1$	–	V
Low Voltage Detection time	$t_{LVR}$	$T_A=25^{\circ}\text{C}$	100	–	–	$\mu\text{s}$
Pull-Up Resistor	$R_P$	$V_{IN}=0\text{V}$	–	40	–	$\text{K}\Omega$
		$V_{CC}=3\text{V}$		75		

### 3. Clock Timing ( $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ )

Parameter	Condition	Min	Typ	Max	Unit
FRC Frequency	$25^{\circ}\text{C}, V_{CC}=5.0\text{V}$	–1%	14.7456	+1%	MHz
	$0^{\circ}\text{C} \sim 85^{\circ}\text{C}, V_{CC}=5.0\text{V}$	–1.5%	14.7456	+1.5%	
	$-40^{\circ}\text{C} \sim 85^{\circ}\text{C}, V_{CC}=3.0 \sim 5.5\text{V}$	–3%	14.7456	+3%	

### 4. Reset Timing Characteristics ( $T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ )

Parameter	Conditions	Min	Typ	Max	Unit
RESET Input Low width	Input $V_{CC}=5\text{V} \pm 10\%$	30	–	–	$\mu\text{s}$
WDT wakeup time	$V_{CC}=5\text{V}, \text{WDTPSC}=11$	–	60	–	ms
	$V_{CC}=3\text{V}, \text{WDTPSC}=11$	–	64	–	

### 5. ADC Electrical Characteristics ( $T_A = 25^{\circ}\text{C}, V_{CC} = 3.0\text{V} \sim 5.5\text{V}, V_{SS} = 0\text{V}$ )

Parameter	Conditions	Min	Typ	Max	Unit
Total Accuracy	$V_{CC}=5.12\text{V}, V_{SS}=0\text{V}$	–	$\pm 2.5$	$\pm 4$	LSB
Integral Non-Linearity		–	$\pm 3.2$	$\pm 5$	
Max Input Clock ( $f_{ADC}$ )	Source impedance ( $R_s < 10\text{K ohm}$ )	–	1	–	MHz
	Source impedance ( $R_s > 10\text{K ohm}$ )	–	0.5	–	
Conversion Time	$F_{ADC} = 1\text{MHz}$	–	50	–	$\mu\text{s}$
BandGap Voltage Reference (VBG)	$25^{\circ}\text{C}, V_{CC} = 5\text{V} \sim 3\text{V}$	–1%	1.22	+1%	V
	$25^{\circ}\text{C} \sim 85^{\circ}\text{C}, V_{CC} = 5\text{V} \sim 3\text{V}$	–1%	1.22	+1.5%	V
	$-20^{\circ}\text{C} \sim 85^{\circ}\text{C}, V_{CC} = 5\text{V} \sim 3\text{V}$	–2%	1.22	+1.5%	V
ADC reference voltage ( $V_{REFS}$ ) ( $\text{ADCVREFS}=01$ )	$25^{\circ}\text{C}, V_{CC} = 3\text{V} \sim 5.5\text{V}$	–1.2%	2.5V	+1.2%	V
	$-20^{\circ}\text{C} \sim 85^{\circ}\text{C}, V_{CC} = 3\text{V} \sim 5.5\text{V}$	–2.5%	2.5V	+2%	V
$V_{CC}/4$ reference voltage	$25^{\circ}\text{C}, V_{CC} = 3\text{V} \sim 5.5\text{V}$	–1%	$0.252 \cdot V_{CC}$	+1%	V

△ \* NOTES : DIMENSION B APPLIES TO METALLIZED TERMINAL AND IS MEASURED  
 BETWEEN 0.15mm AND 0.30mm FROM THE TERMINAL TIP. IF THE TERMINAL HAS  
 THE OPTIONAL RADIUS ON THE OTHER END OF THE TERMINAL,  
 THE DIMENSION B SHOULD NOT BE MEASURED IN THAT RADIUS AREA.  
 BILATERAL COPLANARITY ZONE APPLIES TO THE EXPOSED HEAT SINK  
 SLUG AS WELL AS THE TERMINALS.
