TMP86PS64F

The TMP86PS64F is a OTP type MCU which includes 60 Kbytes One-time PROM. It is a pin compatible with a mask ROM product of the TMP86CS64F. Writing the program to built-in PROM, the TMP86PS64F operates as the same way as the TMP86CS64F. Using the Adapter socket, you can write and verify the data for the TMP86PS64F with a general-purpose PROM programmer same as TC57100D/AD.

Operation

This section describes the functions and basic operational blocks of TMP86PS64F.

The TMP86PS64F has PROM in place of the mask ROM which is included in the TMP86CS64F. The configuration and function are same as the TMP86CS64F. For TMP86CS64F, however, some functions have been partially changed or deleted. For the function of TMP86PS64F in details, see the section of TMP86CS64F

In addition, TMP86PS64F operates as the single clock mode when releasing reset.

When using the dual clock mode, oscillate a low-frequency clock by SET. XTEN command at the beginning of program.

1. Operating Mode

The TMP86PS64F has MCU mode and PROM mode.

1.1 MCU Mode

The MCU mode is set by fixing the TEST/VPP pin to the “L” level (TEST/VPP pin cannot be used open because it has no built-in pull-down resistor).

1.1.1 Program memory

The TMP86PS64F has a 60 Kbyte built-in one time PROM (addresses 1000 to FFFFH in the MCU mode, addresses 0000 to EFFFH in the PROM mode).

When using TMP86PS64F for evaluation of TMP86CS64F, the program is written in the program storing area shown in Figure 1-1.

Figure 1-1. Program Memory Area

Note: The area that is not in use should be set data to FFH, or a general-purpose PROM programmer should be set only in the program memory area to access.

1.1.2 Data Memory

TMP86PS64 has a built-in 2-Kbyte data memory (static RAM).

1.1.3 Input/Output Circuitry

(1) Control pins

The control pins of the TMP86PS64 are the same as those the TMP86CS64 except that the TEST pin does not have a built-in pull-down resistor.

(2) I/O ports

The I/O circuities of TMP86PS64 I/O ports are the same as those of TMP86CS64.

Note: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Note: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (supply voltage, operating temperature range, specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

Using other than the above condition may cause the trouble of the writing.
