TMP90PM38F/TMP90PM38T

1. Outline and Characteristics

The TMP90PM38 is a system evaluation LSI having a

built-in One-Time PROM (16K byte) for TMP90CM38.

A programming and verification for the internal PROM is achieved by using a general EPROM programmer with an adapter socket.

The function of this device is exactly the same as the TMP90CM36 by programming to internal PROM:

3. Operation

The TMP90PM38 is the OTP version of the TMP90CM38 that is replaced an internal ROM from Mask ROM to EPROM.

Refer to the TMP90PM38 except for the functions which are not described in this section.

The following is an explanation of the hardware configuration and operation in relation to the TMP90CM38.

The TMP90PM38 has an MCU mode and a PROM mode.

3.1 MCU Mode

(1) Mode Setting and Function

The MCU mode is set by opening the CLK pin (Output status).

In the MCU mode, the operation is the same as that of TMP90CM38.

(2) Memory Map

Figure 3.1 show the memory map of TMP90CM38 and TMP90PM38.

Figure 3.1. TMP90PM38 and TMP90CM38 Memory Map

3.2 PROM Mode

(1) Mode Setting and Function

PROM mode is set by setting the $\overline{\text{RESET}}$ and CLK pins to the “L” level.
The programming and verification for the internal PROM is acheived by using a general EPROM pro-

grammer with the adapter socket. The device selection (ROM Type) should be “TC571000D” with the following conditions.

Size: 1M bit (128K x 8bit), VPP: 12.75V±0.25V,
TPW: 0.1ms VCC: 6.25±0.25V

Figure 3.2 shows the setting of pins in PROM mode.

Figure 3.2. PROM Mode Pin Setting

(2) Programming Flow Chart

The programming mode is set by applying 12.75V (programming voltage) to the VPP pin when the following pins are set as follows.

(VCC: 6.25V) *These conditions can be obtained
(RESET: "L" level) by using adapter socket.
(CLK: "L" level)

After the address and data have been fixed, a data on the Data Bus is programmed when the PGM pin is set to "Low" (0.1ms plus is required).

General programming procedure of an EPROM programmer is as follows.

- Write data to a specified address for 0.1ms.
- Verify the data. If the read-out data does not match the expected data, another writing is performed until the correct data is written (Max. 25 times).

Then, verify the data and increment the address.

The verification for all data is done under the condition of $V_{PP} = V_{CC} = 5V$ after all data were written.

Figure 3.3 shows the programming flowchart.

(3) The Security Bit

The TMP90PM38 has the Security Bit in PROM cell. If the Security Bit is programmed to "0", the content of the PROM is disable to read in PROM mode.

How to program the Security Bit

In the PROM MODE

- (1) Connect P40 pin to V_{CC}
- (2) Set A0 ~ A16 to "0" respectively
- (3) Set the 8-bit data to "FE_H"

High Speed Program Formula

- Note
1. Force V_{PP} (12.75V) power supply and V_{CC} power supply at the same time, or V_{PP} (12.75V) power supply later than V_{CC} power supply. And interrupt V_{PP} (12.75V) power supply and V_{CC} power supply at the same time, or V_{PP} (12.75V) power supply before V_{CC} power supply.
 2. Please attend to drawing and rising in the programming (mode) in 12.75V to the V_{PP} as there is some possibility that you give "DAMAGE" to the devices.
 3. Don't force more than 14V (voltage) including over shoot to the V_{PP} pin in the programming as maximum rating of V_{PP} pin is 14V (voltage).
