Preface

Thank you very much for making use of Toshiba microcomputer LSIs.
Before use this LSI, refer the section, "Points of Note and Restrictions".
Especially, take care below cautions.

****CAUTION****

How to release the HALT mode

Usually, interrupts can release all halts status. However, the interrupts = ($\overline{\text{NMI}}$, INT0 to 4, INTRTC) which can release the HALT mode may not be able to do so if they are input during the period CPU is shifting to the HALT mode (for about 5 clocks of f_{FPH}) with IDLE1 or STOP mode (IDLE2 is not applicable to this case). (In this case, an interrupt request is kept on hold internally.)

If another interrupt is generated after it has shifted to HALT mode completely, halt status can be released without difficulty. The priority of this interrupt is compare with that of the interrupt kept on hold internally, and the interrupt with higher priority is handled first followed by the other interrupt.

Input Voltage	V _{IN}	−0.5 to V _{CC} + 0.5	V
Output Current	I _{OL}	2	mA
Output Current	I _{OH}	−2	mA

Note: The maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no maximum rating value will ever be exceeded.

4.9 Bus Request/Bus Acknowledge

Parameter	Symbol	Variable		$f_{\text{FPH}} = 10 \text{ MHz}$		$f_{\text{FPH}} = 27 \text{ MHz}$		Condition	Unit
		Min	Max	Min	Max	Min	Max		
Output Buffer Off to $\overline{\text{BUSAK}}$ Low	t_{ABA}	0	80	0	80	0	80	$V_{\text{CC}} \geq 2.7 \text{ V}$	ns
		0	300	0	300	0	300	$V_{\text{CC}} < 2.7 \text{ V}$	
$\overline{\text{BUSAK}}$ High to Output Buffer On	t_{BAA}	0	80	0	80	0	80	$V_{\text{CC}} \geq 2.7 \text{ V}$	ns
		0	300	0	300	0	300	$V_{\text{CC}} < 2.7 \text{ V}$	

Note 1: Even if the $\overline{\text{BUSRQ}}$ Signal goes Low, the bus will not be released while the $\overline{\text{WAIT}}$ signal is Low. The bus will only be released when $\overline{\text{BUSRQ}}$ goes Low while $\overline{\text{WAIT}}$ is High.

Note 2: This line shows only that the output buffer is in the Off state.

It does not indicate that the signal level is fixed.

Just after the bus is released, the signal level set before the bus was released is maintained dynamically by the external capacitance. Therefore, to fix the signal level using an external resistor during bus release, careful design is necessary, since fixing of the level is delayed.

The internal programmable pull-up/pull-down resistor is switched between the active and non-active states by the internal signal.

4.10 Recommended Oscillation Circuit

TMP91CY22I has been evaluated by murata manufacturing Co., Ltd. Please refer to murata manufacturing Co., Ltd.

Note: Total loads value of oscillator is sum of external loads (C1 and C2) and floating loads of actual assemble board. There is a possibility of miss-operating. When designing board, it should design minimum length pattern around oscillator. And we recommend that oscillator evaluation try on your actual using board.
