## TMR Magnetic Rotary Encoder

### Description

The TMR3102 is a contactless, high-precision, and high-speed magnetic rotary encoder sensor, which integrated with tunneling magnetoresistance (TMR) sensors and CMOS digital signal processing circuitry.

The TMR3102 senses the single pole-pair magnet rotation above the chip by TMR sensors, collects the rotating magnetic field signal, transmits it to the digital processing unit, and calculates the rotation angle. TMR3102 outputs 12-bit absolute position signal through SPI communication protocol. At the same time, it is able to output analog and PWM signals, with rotational speed up to 20,000 RPM.

SOP8

### Features and Benefits

- Tunneling magnetoresistance (TMR) technology
- Contactless measurement
- Available in Analog and PWM interfaces output
- 12-bit absolute position output in SPI mode
- Programmable zero position
- Angular repeatability  $< \pm 0.2^\circ$
- Speeds up to 20,000 RPM
- Adaptive supply voltage: 3.3 V to 5 V
- RoHS & REACH compliant

### Applications

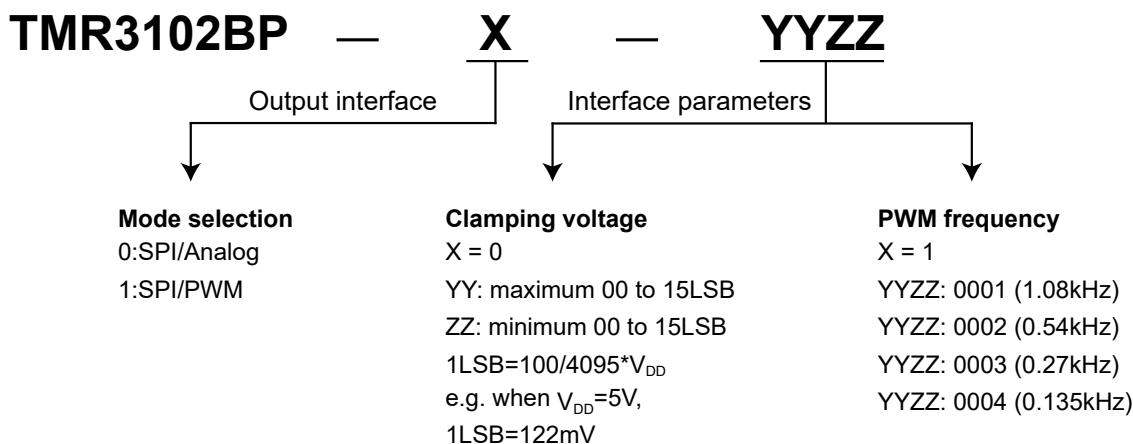

- Contactless angular position measurement
- Brushless motor position sensing
- Rotary speed sensing
- Rotary angular sensing

## 10. Output mode

### 10.1 SPI output

TMR3102 provides the 4-wire SPI interface for user programming in common mode 1 (CPOL = 0, CPHA = 1). Data communication is only enabled when the CS pin is set to "L". The MOSI pin carries the serial input data that will be written to the IC upon the falling edge of the SCLK signal. The serial output data is available to read at the MISO pin upon the rising edge of the SCLK signal.

### Reading angular values

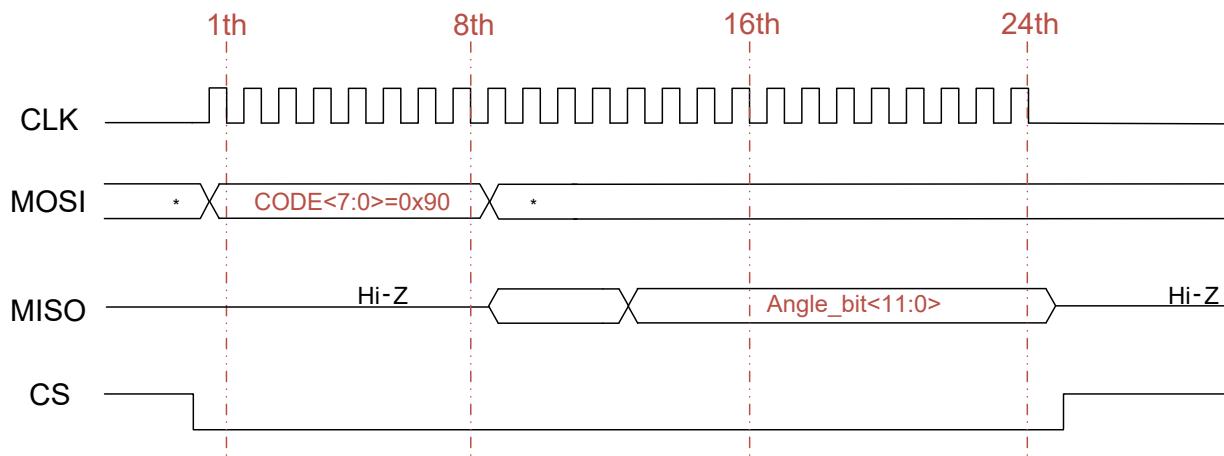

Figure 4. SPI timing diagram in reading angular values

Opcode< 7:0 >=0 x 90 (MSB first), angular value output < 11:0 > (MSB first)

The absolute angular value  $\theta$  in  $0^\circ$  to  $360^\circ$  can be calculated from the equation below:

$$\theta = \frac{\sum_{i=0}^{11} 2^{\text{Angle}\langle i \rangle}}{4096} \times 360^\circ$$

## 10.2 Analog output

TMR3102 integrates a 12-bit ADC to convert absolute angle to linear analog output. The output mode needs to be programmed to be an analog voltage output as shown in Figure 5.

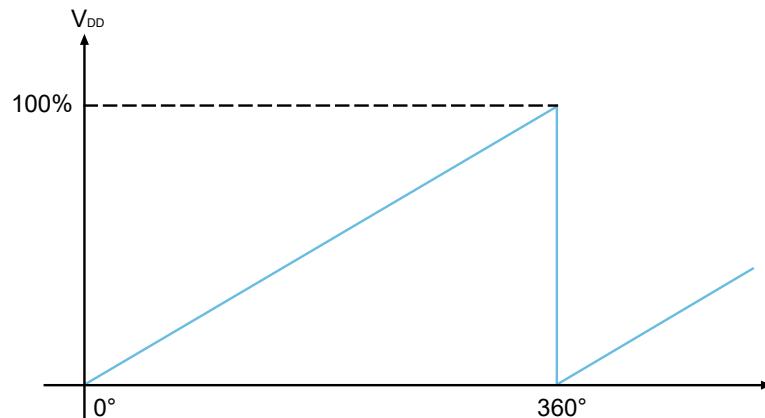

Figure 5. Waveform of analog output

A typical application circuit for analog mode is provided in Figure 6. It is recommended to connect an external decoupling capacitor C1 (typical value 10 nF, maximum 100 nF) and pull-up resistor R1 (typical value 10 k $\Omega$ ) for analog output circuit to obtain better performance.

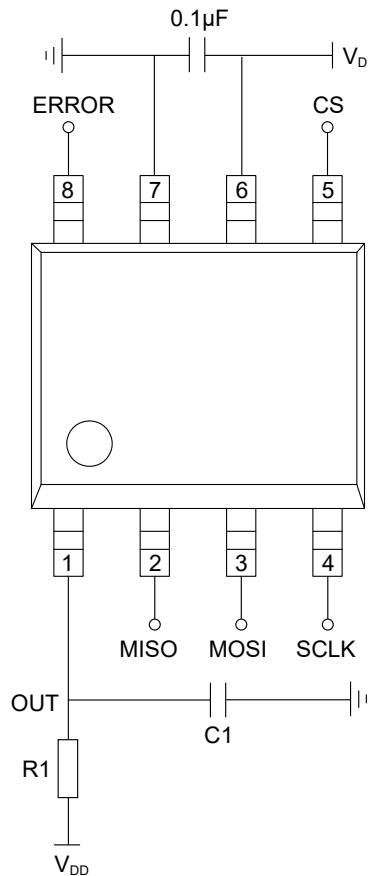

Figure 6. Schematic circuit of analog mode

The high clamping voltage (Clamp\_High) and low clamping voltage (Clamp\_Low) of analog output characteristic curves are both programmable as shown in Figure 7.

The xMR310X calibration kit and corresponding host computer software is provided for the convenience of customer calibration and settings. The clamping voltage in analog mode of TMR3102 sensor can be set by this xMR310X calibration kit.

### 10.3 PWM output

TMR3102 supports pulse width modulation (PWM) output. The duty cycle of PWM is a logic signal which proportional to the magnetic field angle. The duty cycle is limited by the minimum value (1/4096 of the period) and the maximum value (4095/4096 of the period), so the duty cycle varies from 1/4096 to 4095/4096 with the resolution of 12-bits. Figure 8 shows one period of the PWM signal, and the period (T) is  $1/F_{\text{PWM}}$ .

$F_{\text{PWM}}$  supports 1.08 kHz, 0.54 kHz, 0.27 kHz, and 0.135 kHz these four frequencies.
