250mA Dual Outputs AMOLED Display Power Supply

Check for Samples: TPS65137AS

FEATURES

- 2.5 V to 4.8 V Input Voltage Range
- 0.8% Output Voltage Accuracy V_{POS}
- **Excellent Line Transient Regulation**
- **250 mA Output Current**
- **Fixed 4.6 V V_{POS} Output Voltage**
- **Digitally Programmable V_{NEG}, –2.2V to –5.2V**
- **–4.9V Default Value for V_{NEG}**
- **Short Circuit Protection**
- **Thermal Shutdown**
- **3mm × 3mm 10-Pin QFN Package**

APPLICATIONS
- **Active Matrix OLED**

DESCRIPTION

The TPS65137AS is designed to drive AMOLED displays (Active Matrix Organic Light Emitting Diode) requiring positive and negative voltage supply rails. The device integrates a boost converter with LDO post regulator and an inverting buckboost converter suitable for battery operated products. The digital control pin (CTRL) allows programming the negative output voltage in digital steps. The TPS65137AS uses a novel technology enabling excellent line and load regulation. This is required to avoid disturbance of the AMOLED display by the input voltage disturbances occurring during transmit periods in mobile phones.

TYPICAL APPLICATION

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of the Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Copyright © 2011–2013, Texas Instruments Incorporated

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION[1] [2]

T_A	PACKAGE[2]	ORDERABLE PART NUMBER	TOP-SIDE MARKING
−40°C to 85°C	10-Pin 3x3 QFN	TPS65137ASDSCR	PPGC

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.
(2) Package drawings, thermal data, and symbolization are available at www.ti.com/packaging.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)[1]

		VALUE		UNIT
		MIN	MAX	
Pin Voltage[2]	PVIN, SWP, OUTP, CTRL, VL, CB		5.5	V
	OUTN		−6.5	V

DETAILED DESCRIPTION

The TPS65137AS consists of a boost converter using an LDO as post regulator and an inverting buck-boost converter. The positive output is fixed at 4.6V. The negative output is programmable by a digital interface in the range of −2.2V to −5.2V, the default is −4.9V. The transition time of the negative output is adjustable by the CT pin capacitor.

SOFT START and START-UP SEQUENCE

The device has a soft start to limit the in-rush current. When the device is enabled by the CTRL pin going HIGH, the boost converter starts with a reduced switch current limit. 8ms after CTRL going HIGH, the buck-boost converter starts with the default value of −4.9V. The typical start-up sequence is shown in Figure 8.
Figure 8. Start-up Sequence

SHORT CIRCUIT PROTECTION

The device is protected against short circuits of the outputs to ground and short circuit of the outputs to each other. During normal operation, an error condition is detected if V_{POS} falls below 3.7V for more than 3ms or V_{NEG} gets above 420mV above the programmed value for more than 3ms. In either case, the device goes into shutdown and this state is latched. The input and the outputs are disconnected. To resume normal operation, V_{IN} has to cycle below UVLO or CTRL has to toggle LOW and HIGH.

During start up, an error condition is detected in the following cases:
- V_{POS} is not in regulation 10ms after CTRL goes HIGH.
- V_{NEG} is higher than threshold level 10ms after CTRL goes HIGH.
- V_{NEG} is not in regulation 20ms after CTRL goes HIGH.

In the above cases, the device goes into shutdown and this state is latched. The input and the outputs are disconnected. To resume normal operation, VIN has to cycle below UVLO or CTRL has to toggle LOW and HIGH.

ENABLE (CTRL PIN)

The CTRL pin serves two functions. One is to enable and disable the device the other is the output voltage programming of the device. If the digital interface is not required the CTRL pin can be used as a standard enable pin for the device and the device will come up with its default value on V_{NEG} of −4.9V. When CTRL is pulled high, the device is enabled. The device is shut down with CTRL low.

DIGITAL INTERFACE (CTRL)

The digital interface allows programming the negative output voltage V_{NEG} in digital steps. If the digital output voltage setting is not required then the CTRL pin can also be used as a standard enable pin.

The digital output voltage programming of V_{NEG} is implemented by a simple digital interface with the timing shown in Figure 9.
Figure 9. Digital Interface Using CTRL

Once CTRL is pulled high the device will come up with its default voltage of −4.9V. The device has a 6-bit DAC implemented with the corresponding output voltages as given in the table below. The interface counts now the rising edges applied to the CTRL pin once the device is enabled. For the example above, V_{NEG} is programmed to −5.0V since 3 rising edges are detected. Other output voltages can be programmed according Table 2.

Table 2. Programming Table for V_{NEG}

BIT/RISING EDGES	V_{NEG}	DAC VALUE	BIT/RISING EDGES	V_{NEG}	DAC VALUE
0/ no pulse	−4.9 V	00000	16	−3.7 V	10000
1	−5.2 V	00001	17	−3.6 V	10001

SETTING TRANSITION TIME t_{set} for V_{NEG} (C_T)

The device allows setting the transition time t_{set} using an external capacitor connected to pin CT. The transition time is the time period required to move V_{NEG} from one voltage level to the next programmed voltage level. The capacitor connected to pin CT does not influence the soft start time t_{ss} of the V_{NEG} default value. When the CT pin is left open then the shortest possible transition time is programmed. When connecting a capacitor to the CT pin then the transition time is given by an R-C time constant. This is given by the output impedance of the CT pin typically 325kΩ and the external capacitance. Within one τ the output voltage V_{NEG} has reached 70% of its programmed value. An example is given when using 100nF for C_T.

$$\tau \approx t_{set70\%} = 325 \text{ k}\Omega \times C_T = 325 \text{ k}\Omega \times 100 \text{ nF} = 32.5 \text{ mS}$$

The output voltage is almost at its programmed value after 3τ.

PCB LAYOUT

Figure 10 and Figure 11 show an example of a PCB layout design.

1. Place the input capacitor on VIN and the output capacitor on OUTN as close as possible to the device.
   Use short and wide traces to connect the input capacitor to VIN and the output capacitor to OUTN.
2. Place the output capacitor on OUTP and the capacitor on CB as close as possible to the device.
   Use short and wide traces to connect the output capacitor to OUTP.
3. Connect the ground of the CT capacitor to the GND pin, pin 6, directly.
4. Connect the input ground and the output ground on the same board layer, not through vias.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65137ASDSCR	ACTIVE	WSON	DSC	10	3000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-2-260C-1 YEAR	-40 to 85	PPGC	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
