TPS92511 500-mA, 65-V Common Anode Constant Current Buck LED Driver Without External Current Sensing Resistor

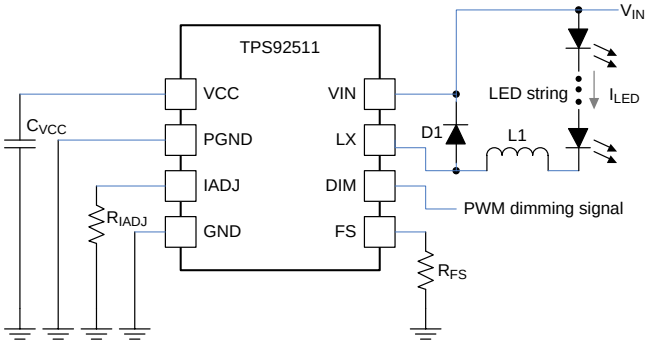
1 Features

- Wide Input Voltage Range: 4.5 V to 65 V
- Requires NO External Current Sensing Resistor
- Requires NO External Loop Compensation
- Ease of Use, Needs Minimum 5 Components
- 1000:1 Contrast Ratio Feasible
- Single Layer PCB Feasible
- Can Work as High Voltage Buck Regulators
- Can Work as Linear Current Shunt Regulators
- Integrated Low-side N-channel MOSFET
- LED Current Programmable up to 0.5 A
- Typically ±3.6% LED Current Accuracy
- Switching Frequency Programmable From 50 kHz to 500 kHz
- Current Limit Protection
- VCC Under-voltage Lock-out
- Thermal Shutdown Protection
- Support Analog Dimming and Thermal Foldback
- Power Enhanced SOIC-8 Exposed Thermal Pad Package (HSOP-8)

2 Applications

- High Power LED Driver
- Architectural Lighting
- Office Troffer
- Automotive Lighting
- MR-16 LED Lamp

Simplified Application



3 Description

The TPS92511 is an easy to use 65V constant current buck converter for driving a single LED string with current up to 0.5A and efficiency up to 95%. Only 5 external components are required for basic operation and single layer PCB layout is feasible because of the integration of a N-MOSFET, no external current sensing resistor, no external compensation and the proper terminal assignment. A high-value external resistor programs the LED current so that fine tuning of the LED current can be achieved. Another high-value external resistor programs a constant switching frequency from 50kHz to 500kHz. EMI design becomes easier as a result of constant switching frequency. The TPS92511 provides a wide input voltage range from 4.5V to 65V. By adding simple external circuits, the device can handle applications with even higher input voltages.

The TPS92511 employs a proprietary control scheme to regulate the LED current without the need of sensing the LED current directly. It applies a floating buck topology with a low-side N-channel power MOSFET, which does not need boot-strapping capacitor. For multiple channel systems, the floating buck topology together with the proprietary control scheme allows a common-anode connection of the LED strings without an external current sensing network. This significantly reduces the number of wiring and as well as overall manufacturing cost.

The TPS92511 has very fast PWM dimming response time. For example, if the switching frequency is 500 kHz, the minimum DIM pulse width is 6µs and the dimming frequency is 150Hz, a contrast ratio of more than 1000:1 can be achieved.

The TPS92511 is available in the Power Enhanced SOIC-8 exposed thermal pad package.

Pin Functions

PIN		DESCRIPTION
NAME	NO.	
DIM	6	PWM Dimming Control. Apply logic level PWM signal to this pin dims the LED string. This pin is internally pulled up.
FS	5	Switching Frequency Setting. An external resistor R_{FS} connecting the FS pin to ground programs the switching frequency from 50 kHz to 500 kHz.
GND	4	Analog Signal Ground.
IADJ	3	Average LED Current Setting. An external resistor R_{IADJ} connecting the IADJ pin to ground programs the average LED current.
LX	7	Integrated MOSFET Drain. Internally connected to the drain of the integrated MOSFET. Connect this pin to the output inductor and anode of the Schottky diode.
PGND	2	Power Ground. Must be connected to the GND pin for normal operation. The PGND and GND pins are not internally shorted.
VCC	1	Internal Regulator Output. Typically regulated to 5.4 V. Connect a capacitor of larger than 1 µF between the VCC and GND pins.
VIN	8	Input Voltage. Supply pin to the device. The input voltage range is from 4.5 V to 65 V.
Thermal pad		Thermal Connection Pad. Connect to a ground plane for heat dissipation.

6 Specifications

6.1 Absolute Maximum Ratings (1)

Unless otherwise specified, $T_J = T_A = 25°C$

		MIN	NOM	MAX	UNIT
Pin voltage range	VIN to GND	–0.3		65	V
	VIN to GND (Transient)	–0.3		67	V
	LX to PGND	–0.3		65	V
	LX to PGND (Transient)	–3(2ns)		67	V
	FS, IADJ to GND	–0.3		5	V
	DIM to GND	–0.3		6	V
	VCC to GND	–0.3		7	V
Temperature range	Operating junction temperature range, T_J	–40		Internally limited	°C

(1) Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is intended to be functional. For specified specifications and test conditions, see the Electrical Characteristics.

6.2 Handling Ratings

		MIN	MAX	UNIT
T_{stg}	Storage temperature range	-65	150	°C
V_{ESD} (1)	Human Body Model (HBM) ESD stress voltage (2)		1.5	kV
	Charged Device Model (CDM) ESD stress voltage (3)		1.5	kV

(1) Electrostatic discharge (ESD) to measure device sensitivity and immunity to damage caused by assembly line electrostatic discharges in to the device.
(2) Level listed above is the passing level per ANSI, ESDA, and JEDEC JS-001. JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(3) Level listed above is the passing level per EIA-JEDEC JESD22-C101. JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{IN}	Supply voltage range	4.5		65	V
T_A	Operating free air temperature	–40		125	°C
T_J	Operating junction temperature	-40		125	°C

6.4 Thermal Information

THERMAL METRIC (1)		TPS92511 DDA 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	59.9	°C/W
$R_{\theta JCtop}$	Junction-to-case (top) thermal resistance	59.1	
$R_{\theta JB}$	Junction-to-board thermal resistance	30.6	
ψ_{JT}	Junction-to-top characterization parameter	11.0	
ψ_{JB}	Junction-to-board characterization parameter	30.5	
$R_{\theta JCbot}$	Junction-to-case (bottom) thermal resistance	4.2

7 Detailed Description

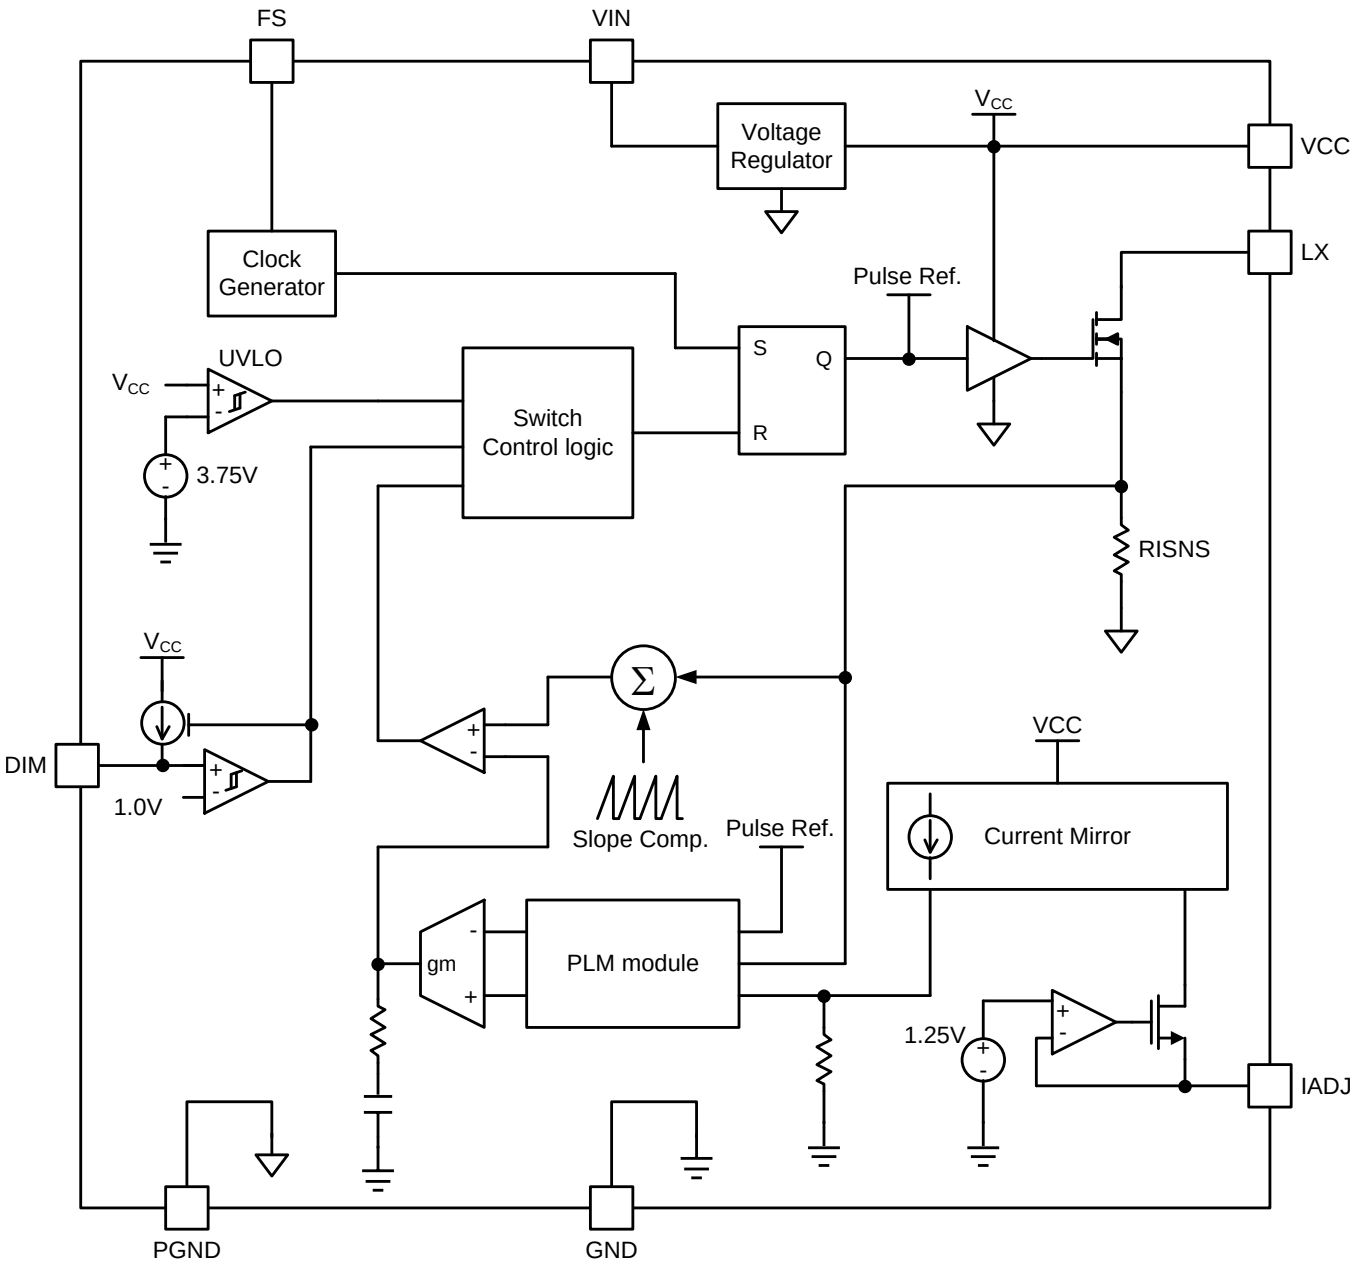
7.1 Overview

The TPS92511 is an easy to use constant current buck converter for driving a single LED string with current up to 0.5A and efficiency up to 95%. Only 5 external components are required for basic operation and single layer PCB layout is feasible because of the integration of a N-MOSFET, no external current sensing resistor, no external compensation and the proper pin assignment. A high-value external resistor programs the LED current so that fine tuning of the LED current can be achieved. Another high-value external resistor programs a constant switching frequency from 50kHz to 500kHz. As a result of constant switching frequency, EMI design becomes easy. The TPS92511 provides a wide input voltage range from 4.5V to 65V. By adding simple external circuits, it can handle applications with even higher input voltages.

The TPS92511 employs a proprietary Pulse-Level-Modulation (PLM) control scheme under continuous conduction mode (CCM) to regulate the LED current without the need of sensing the LED current directly. It applies a floating buck topology with a low-side N-channel power MOSFET, which does not need boot-strapping capacitor, so that driving LED string under drop-out conditions and very high input voltages are feasible. For multiple channel systems, the floating buck topology without external current sensing network together with the proprietary control scheme allows a common-anode connection of the LED strings without external current sensing network. This saves high-side current sensing wirings for separate driver boards and LED board systems and significantly reduces the number of wiring, which can lower overall manufacturing cost.

The TPS92511 has very fast PWM dimming response time. There is almost no delay between the DIM pin voltage rising edge and the start of the LED current conduction, so it can dim down to nearly zero current. In order to maintain good dimming linearity, the minimum LED current pulse width is suggested to be three switching cycles. For example, if the switching frequency is 500 kHz, the minimum DIM pulse width is 6µs and the dimming frequency is 150Hz, a contrast ratio of more than 1000:1 can be achieved.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Pulse Level Modulation (PLM) Control

A proprietary Pulse-Level-Modulation (PLM) control method is used in the TPS92511. It can regulate the average LED current by sensing only the inductor current at the on-period (Figure 13). The integrated MOSFET and the sensing and control circuits in the TPS92511 implement the whole PLM control internally so the control does not suffer from tolerance and noise issues that may be coming from external components. As compared with the conventional method which regulates average LED current by sensing the current over the entire switching cycle, the power dissipation on the sensing circuit in PLM is much lower. For example, consider a duty cycle of 0.5, the power dissipation on current sensing in PLM can be reduced by half. PLM requires no external loop compensation circuit. Besides, the accuracy of the regulated LED current is high (typically ±3.5% in the TPS92511).

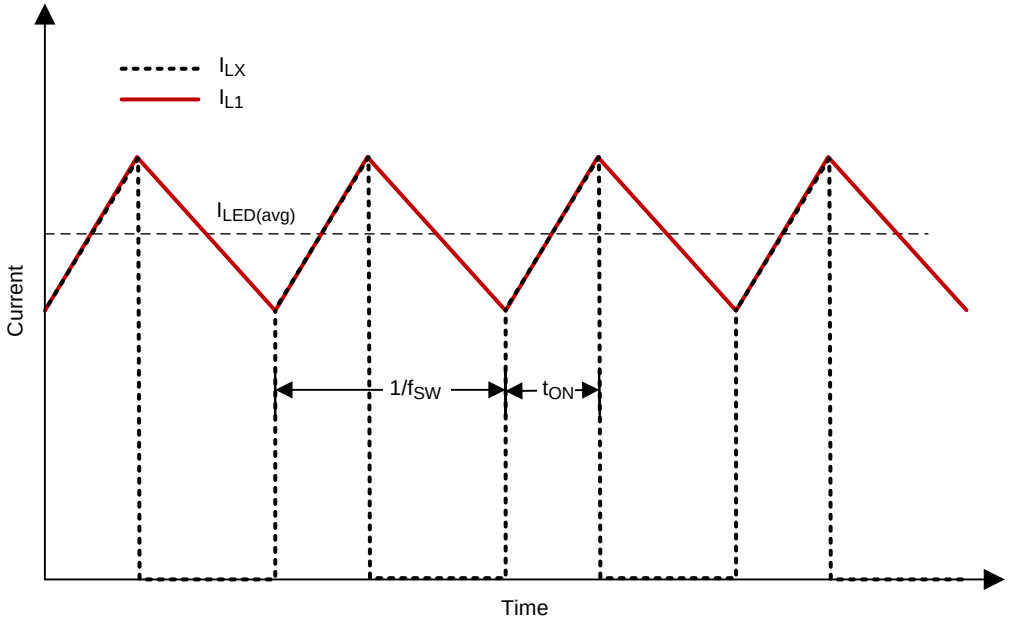


Figure 13. Waveforms of a Floating Buck LED Driver with PLM

7.3.2 Pulse Level Modulation (PLM) Operaion Principles

The Pulse-Level-Modulation is a patented method to ensure an accurate average output current regulation without the need of direct output current sensing. Figure 13 shows the current waveforms of a typical buck converter under steady state, where, I_{L1} is the inductor current and I_{LX} is the current flowing into the LX pin. For a buck converter operating in steady state, the mid-point of the RAMP portion of I_{L1} equals to the average value of I_{L1} and hence the average LED current $I_{LED(avg)}$. In short, by regulating the mid-point with respect to a precise reference level, PLM achieves LED current regulation by sensing the main MOSFET current solely, instead of the entire cycle of I_{L1}.

7.3.3 PLM Control enable Common-Anode Low-Side Sensing (CALS)Technique to Save Wiring

For multi-channel systems with separated driver boards and LED array boards, the Pulse-Level-Modulation (PLM) control scheme enable Common-Anode Low-Side Current Sensing to save inter-board wirings. Figure 14 shows a conventional configuration with a Low-side switching and High-Side Current Sensing. For an n channel system with separated driver and an LED array boards, 2n inter-board wirings are required. For example, an 128-channel system needs 256 inter-board wirings, which implies a high material and manufacturing cost. Figure 15 shows the PLM configuration with Low-side switching and Low-Side Current Sensing. A Common-Anode configuration is used for the LED array board. As shown in the figure, an n channel system with separated driver and LED array boards requires only n+1 inter-board wirings. For an 128-channel system, only 129 inter-board wirings are required. The wiring cost is cut by half, and the cost of the end product can be reduced.

Feature Description (continued)

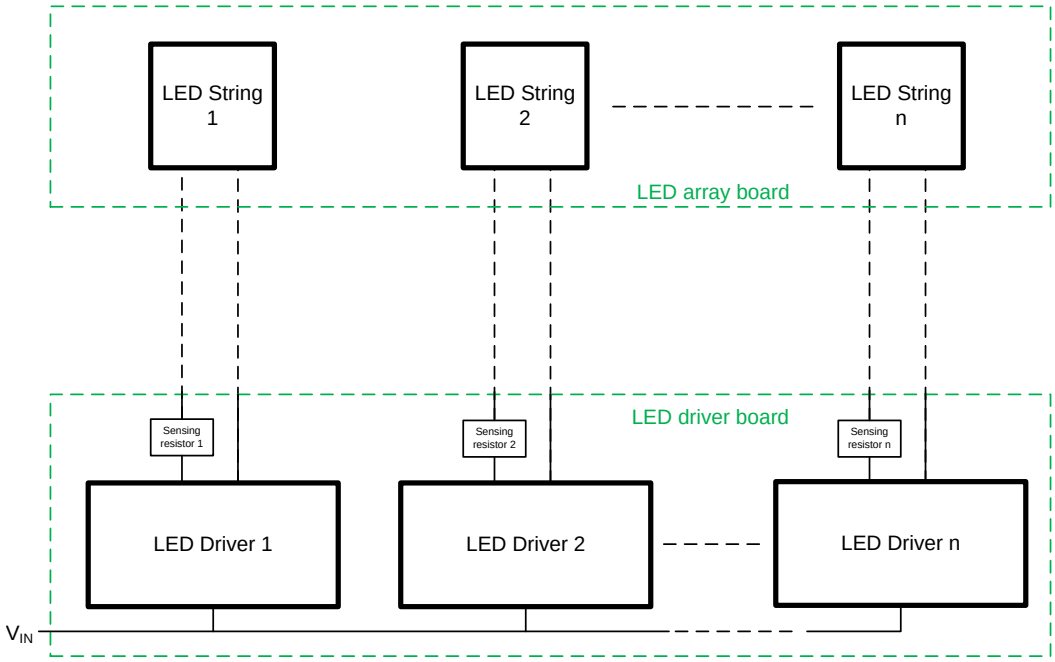

Figure 14. Conventional Configuration with Low-Side Switching and High-Side Current Sensing Requires 2×n Inter-Board Wirings

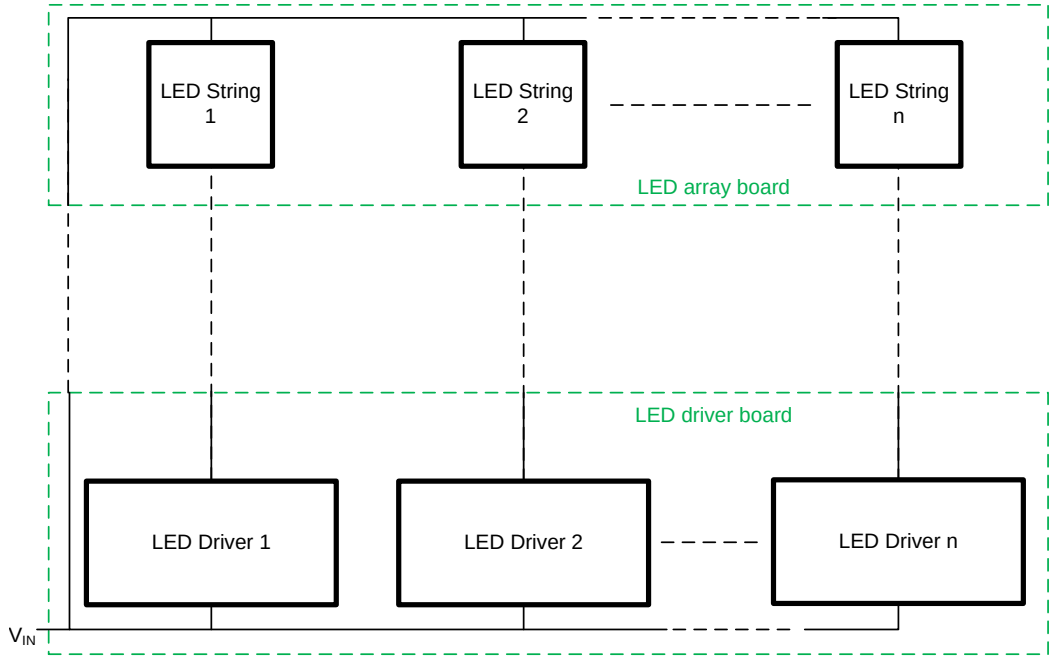

Figure 15. PLM Configuration with Common-Anode Low-Side Switching Requires n+1 Inter-Board Wirings

Feature Description (continued)

7.3.4 Internal Regulator

The TPS92511 integrates an internal voltage regulator for powering internal circuitry. For stability, an external capacitor C_{VCC} of at least 1 µF should be connected between the VCC and PGND pins The output of the internal regulator V_{CC} is 5.4V when V_{IN} is larger than 6V. If V_{IN} is lower than 6V, V_{CC} decreases. The TPS92511 will trigger the VCC under-voltage lock-out if V_{CC} falls below typically 3.5V. V_{CC} can be used to bias external circuits subject to a loading of maximum 2 mA, while it has a short circuit current limit at typically 16 mA.

7.3.5 Setting The Switching Frequency

The switching frequency f_{SW} of the TPS92511 is programmable in the range of 50 kHz to 500 kHz by a single resistor R_{FS} connecting the FS pin and ground. The following equation shows the relationship between f_{SW} and R_{FS}:

$$f_{SW} = \frac{10 \times 10^6}{R_{FS}} \text{kHz} \quad (1)$$

Figure 16 plots f_{sw} against R_{FS}. Table 1 shows values of R_{FS} for commonly used switching frequencies.

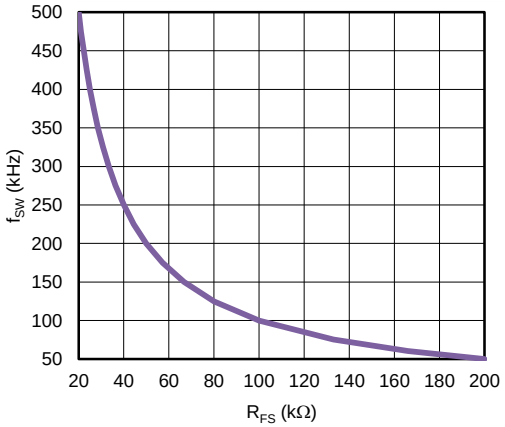

Figure 16. Switching Frequency vs R_{FS}

Table 1. Commonly Used f_{SW} And R_{FS}

f_{SW} (kHz)	R_{FS} (kΩ)
50	200
100	100
300	33.2
500	20

7.3.6 Setting The LED Current

The LED current I_{LED} of the TPS92511 is programmable by a single resistor R_{IADJ} connecting the IADJ pin and ground. The IADJ pin is internally biased to 1.25 V. Equation 2 shows the relationship between I_{LED} and R_{IADJ}:

$$I_{LED} = \frac{1500}{R_{IADJ}} \text{A} \quad (2)$$

To ensure stability, R_{IADJ} must be less that 30 kΩ, implying a minimum I_{LED} of 50 mA can be programmed. The tolerance of I_{LED} of 150 mA is shown in the ELECTRICAL CHARACTERISTICS. Larger tolerance should be expected for lower I_{LED}. Figure 17 plots I_{LED} against R_{IADJ}. Table 2 shows values of R_{IADJ} for commonly used I_{LED}.

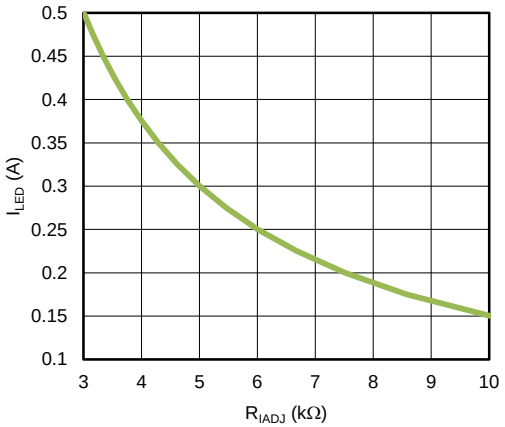

Figure 17. LED Current vs R_{IADJ}

Table 2. Commonly Used I_{LED} And R_{IADJ}

I_{LED} (mA)	R_{IADJ} (kΩ)
150	10
350	4.32
500	3.01

7.3.7 Integrated MOSFET

The TPS92511 integrates a N-channel power MOSFET, the drain of which is connected to the LX pin. When the integrated MOSFET is turned on, the resistance across the LX and GND pins is typically 1.4Ω. The integrated MOSFET has a fixed current limit of 1.2A to protect the application circuit during critical operation conditions like short circuit of the LED string. Once the limit is hit, the integrated MOSFET turns off immediately for 34 µs to let the inductor discharge.

The minimum on-time of the integrated MOSFET is 400 ns. It may be hit at a high switching frequency and a high V_{IN}/V_{LED} ratio. Once hit, the I_{LED} regulation may be affected. In the worst case, I_{LED} may be boost up to a level higher than the programmed value, and the LED string and/or the inductor may be damaged as a result. Hence, it is recommened that the ratio between V_{IN} and V_{LED} should be designed under the following constraint:

$$\frac{V_{LED}}{V_{IN}} \geq 400ns \times f_{SW} \tag{3}$$

7.3.8 Inductor Selection

Operating in the continuous conduction mode (CCM) is required in the TPS92511 application circuit. In the CCM, considering the on-period, the peak-to-peak inductor current ripple ($2\Delta I_{L1}$) is shown in Equation 4.

$$2\Delta I_{L1} = \frac{t_{on}\left(V_{IN} - V_{LED}\right)}{L_1} \tag{4}$$

Because

$$\frac{V_{LED}}{V_{IN}} = t_{on} f_{SW} \tag{5}$$

L_1 can be a function of V_{IN}, V_{LED}, f_{SW} and ΔI_{L1} as shown in Equation 6 .

$$L_1 = \frac{\left(V_{IN} - V_{LED}\right)V_{LED}}{2\Delta I_{L1} V_{IN} f_{SW}} \tag{6}$$

The value of L_1 is selected by designers with the consideration of all above parameters. The minimum L_1 calculated by the following equation is a good starting point for designing L_1:

$$L_1 > 1\mu H\Omega^{-1} \times \frac{R_{FS}R_{IADJ}}{10^6} \quad (7)$$

The following table shows some typical examples of using R_{FS} and R_{IADJ} to estimate the minimum L_1:

Table 3. Estimation Of Minimum L_1 Using R_{FS} And R_{IADJ}

R_{FS} (kΩ)	R_{IADJ} (kΩ)	Estimated Minimum L_1 (µH)	Recommended L_1 (µH)
100	10	1000	1000
33.2	3.01	100	100
20	4.32	86	100
20	3.01	60	68

To maintain the CCM, ΔI_{L1} must be smaller than the average LED current $I_{LED(avg)}$. Hence, the minimum inductance used is:

$$L_{1(min)} = \frac{(V_{IN} - V_{LED})V_{LED}}{2I_{LED(avg)}V_{IN}f_{SW}} \quad (8)$$

In the absence of output capacitors, the TPS92511 can maintain a continuous I_{LED} throughout the entire switching cycle because in such case the inductor current is the same as I_{LED} (floating buck topology operating in the CCM). However, the LED peak current must not exceed the rated current of the LED. The peak LED current can be found by the following equation:

$$I_{LED(peak)} = I_{LED(avg)} + \frac{(V_{IN} - V_{LED})V_{LED}}{2L_1V_{IN}f_{SW}} \quad (9)$$

7.3.9 Integrated MOSFET Current Limit

The current limit of the integrated MOSFET is internally fixed at 1.2A to protect the LED string, the inductor and the integrated MOSFET from overdriven. Once triggered, the integrated MOSFET turns off immediately for 34 µs to let the inductor to discharge. The triggering of the current limit cycles repetitively until all overdriven conditions disappear.

7.3.10 PWM Dimming Control

The TPS92511 implements PWM dimming by applying a PWM dimming signal to the DIM pin. A low input applying to the DIM pin disables the switching of the integrated MOSFET, and as a result discharges the inductor and then turns off the LED string. To turn on the LED string, the DIM pin should be connected to high or left open (since it is internally pulled high by a current of typically 40 µA and 90 µA when the DIM pin is low and high respectively). The PWM dimming frequency is recommended to be lower than $0.1f_{SW}$ to ensure normal operation.

7.3.11 Analog Dimming

Analog dimming can be implemented by injecting a current to R_{IADJ} (Figure 18) and as a result reduces the current of the IADJ pin, I_{ADJ}, which is controlled internally by the TPS92511 to bias the voltage on the IADJ pin to be 1.25V. If the CCM can be maintained, the minimum I_{ADJ} can achieve 15 µA, which refers to an I_{LED} of 18 mA. If I_{ADJ} is further decreased, I_{LED} may not follow due to the presence of the minimum on-time of the integrated MOSFET. If the CCM cannot be maintained, I_{LED} can still decrease monotonically with I_{ADJ}. However, if good line and load regulations are required, the CCM should be maintained by using a large inductance.

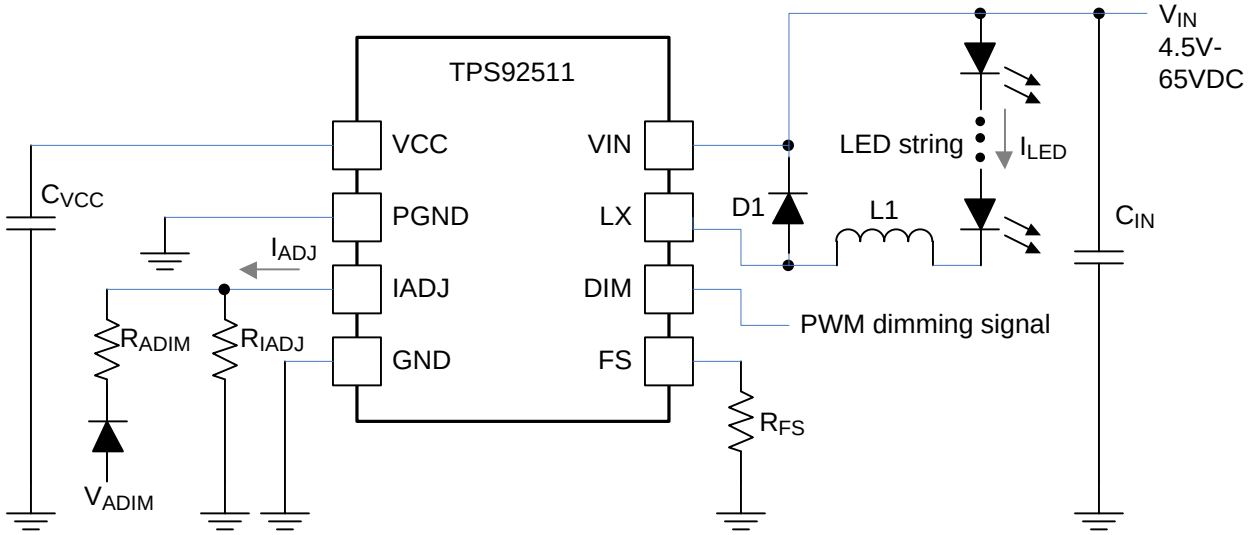

Figure 18. Circuit Configuration for Analog Dimming

7.3.12 High Voltage Buck Configuration

The TPS92511 can handle applications with an input voltage higher than 65V, which is the maximum V_{IN} of the recommended operating condition of the TPS92511, by adding an external high voltage N-channel MOSFET to the application circuit as shown in Figure 19. PWM dimming can be implemented in this circuit without additional efforts, and analog dimming is also feasible by referencing to additional circuits shown in Figure 18.

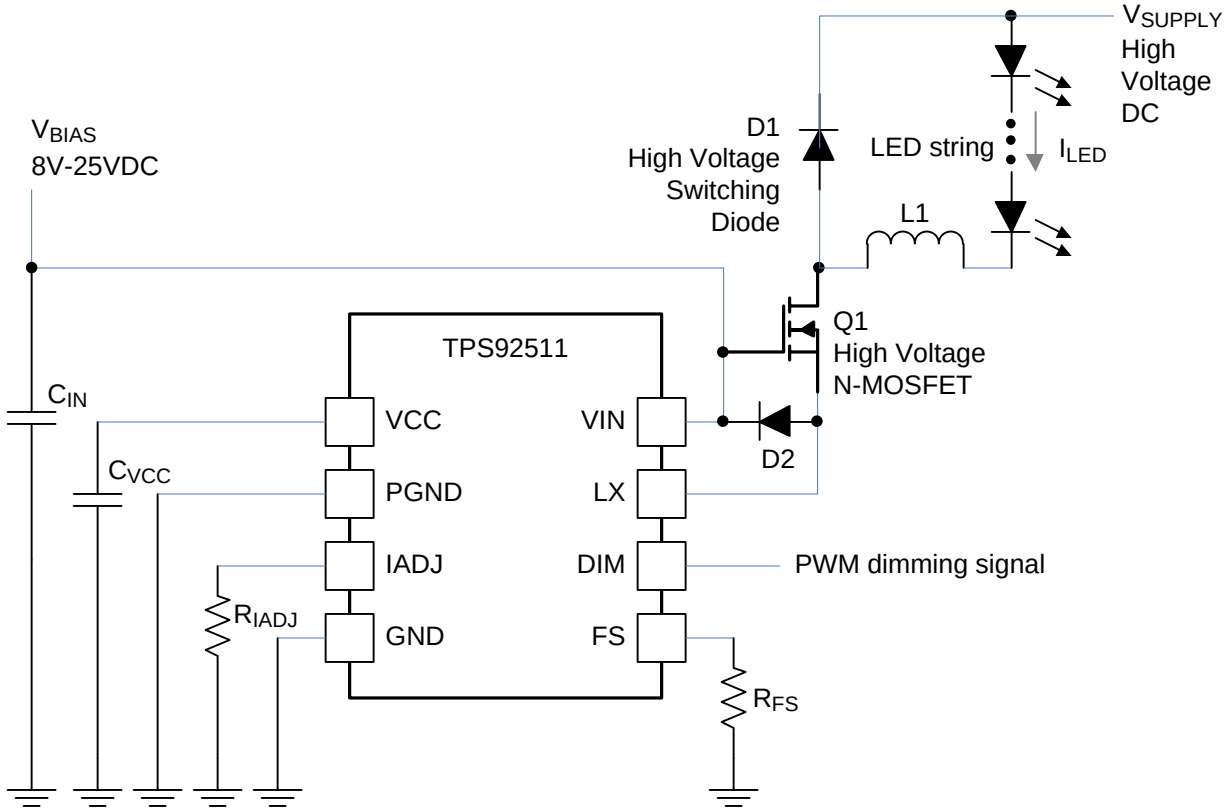

Figure 19. Circuit Configuration for Very High Voltage Buck

7.3.13 Thermal Foldback

Thermal foldback is useful to prevent over-temperature of LEDs during operation by sensing the temperature of LEDs and, if the sensed temperature is high, reducing I_{LED} to decrease the power and as well as the temperature of LEDs. Thanks to the feature of analog dimming, thermal foldback can be implemented by embedding a negative temperature coefficient (NTC) resistor, R_{NTC}, into a circuit as shown in Figure 20. When the sensed temperature increases, R_{NTC} decreases and thus the emitter current of Q_{T1} increases to reduce I_{LED} by means of analog dimming. The resistor R_{TF} can adjust the loop gain of the thermal foldback control loop, which should be high enough to avoid oscillation and maintain stability.

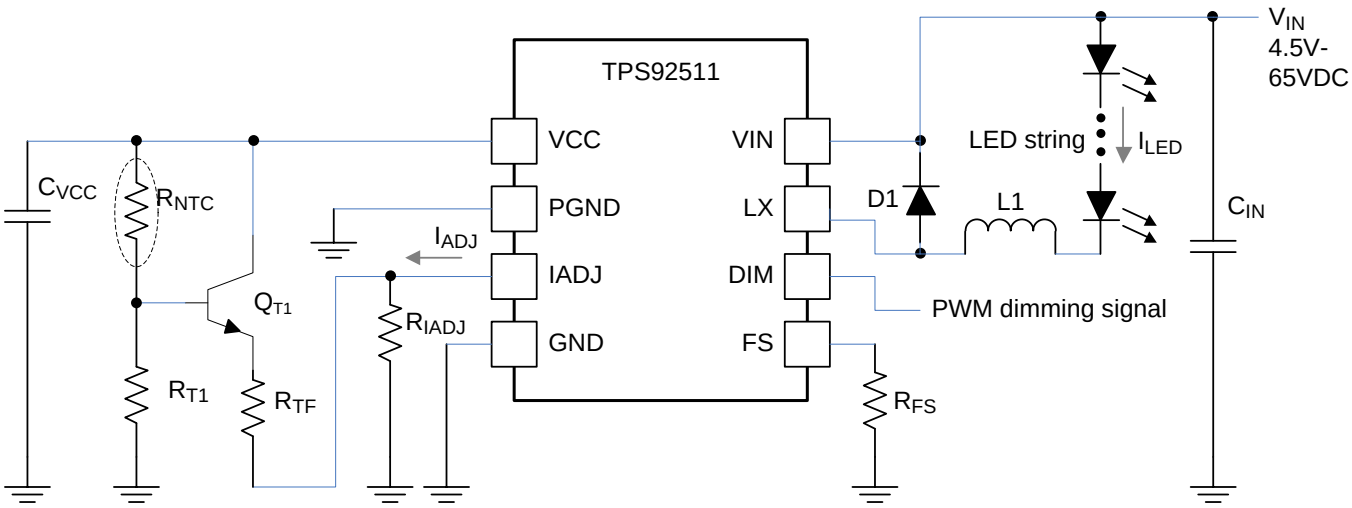

Figure 20. Circuit Configuration for Thermal Foldback

7.3.14 EMI Consideration

Conductive and radiative EMI can be major concerns for lighting applications. The TPS92511 application circuit can be designed for the EN 55022 class B standard by adding a few external components, as shown in Figure 21. The input filter which consists of an inductor L_2 and two capacitors C_{IN2} and C_{IN3} takes care of the conductive EMI, while the output capacitor C_{LED} and the ferrite bead FB_1 which inserts between the LX pin and D_1 take care of the radiative EMI.

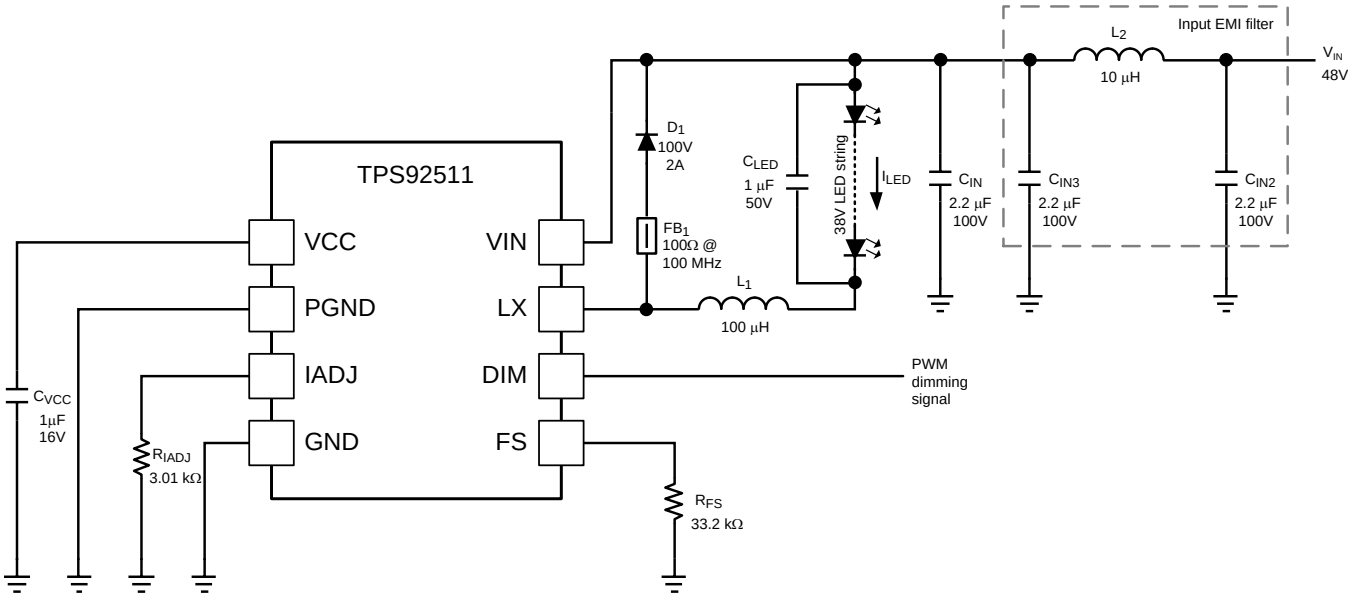

Figure 21. Circuit Configuration with EMI Design Consideration

7.4 Device Functional Modes

7.4.1 Operation with V_{IN} < 4.5 V (minimum V_{IN})

For the typical application circuit, when the input voltage drops so that the VCC voltage regulator is under drop-out mode, and the VCC voltage drops below the “VCC UVLO Lower Threshold” (typically 3.48V), the switching of the main MOSFET is stopped, and the LED current will become zero. At the same time, the voltages of both the FS and IADJ pins will become zero .

When the input voltage increases from zero and the VCC voltage is increased to cross over the “VCC UVLO Upper Threshold” (typically 3.75V), the voltages on the FS and IADJ pins will rise to their regulation voltage (typically 1.25V), the switching of the main MOSFET is started upon the DIM pin voltage is HIGH, and the LED current will ramp up to its preset value set by R_{IADJ}.

7.4.2 Operation with DIM control

For the typical application circuit, when the VCC voltage is not under UVLO condition, the switching of the main MOSFET is enabled and the LED current is conducted if the DIM pin voltage is higher than the “DIM Pin Upper Threshold” (typically 1V).

Alternaltively, the switching is disabled and the LED current is cut off if the voltage of the DIM pin is lower than the “DIM Pin Lower Threshold” (typically 0.675V).

7.4.3 Linear Mode

When the VCC voltage is not under UVLO condition and the voltage on the FS pin is forced to be higher than 4.2V but lower than 5V, the switching of the main MOSFET is disabled, and the TPS92511 is working in the Linear Mode. In the Linear Mode, if the voltage on the DIM pin is higher than the “DIM Pin Upper Threshold” (typically 1V), the TPS92511 will regulate the LX pin in-going current according to the preset value set by R_{IADJ}. Alternatively, if the voltage on the DIM pin is lower than the “DIM Pin Lower Threshold” (typically 0.675V), the LX pin will open and its in-going current will become zero.

Below is the simple configuration to have the TPS92511 working as a linear current shunt regulator.

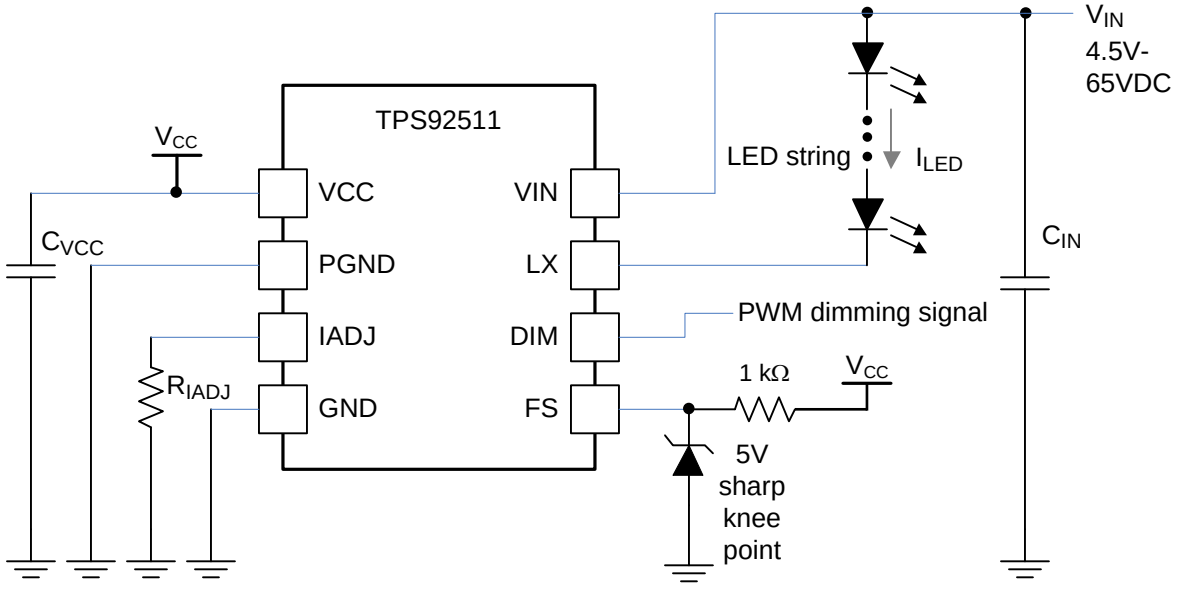

Figure 22. Circuit Configuration for Working as a Linear Current Shunt Regulator

8 Application and Implementation

8.1 Application Information

The TPS92511 is an LED driver which provides a regulated output current to drive a single string of LED with the forward voltage lower than the input voltage. The following procedures design a TPS92511 application circuit with an input voltage of 48V, driving an LED string of 38V at an LED current of 0.5A. The switching frequency is 300 kHz.

8.2 Typical Application

8.2.1 TPS92511 LED driver for 12 LEDs at 0.5A

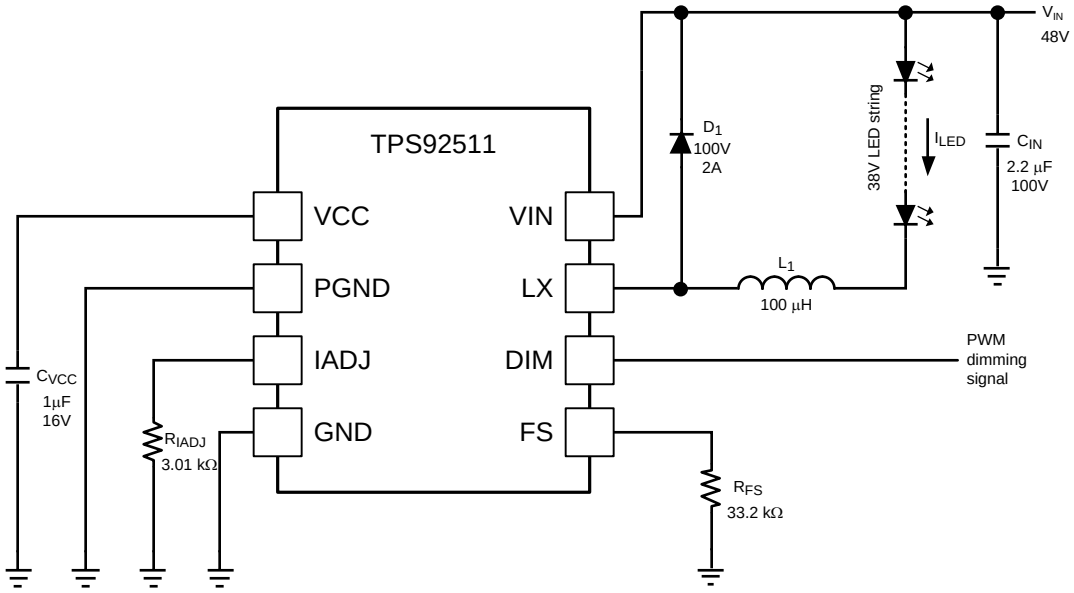

Figure 23. Application Circuit of TPS92511 (f_{SW} = 300 kHz and I_{LED} = 0.5A)

Typical Application (continued)

8.2.1.1 Design Requirements

Table 4. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	43V to 53V
LED current	0.5A
LED string forward voltage	38V
Operating frequency	300 kHz

8.2.1.2 Detailed Design Procedure

C_{IN} : The function of the input capacitor C_{IN} is to reduce the input voltage ripple. Ceramic capacitors are recommended owing to the concern of product lifetime. A 100V 2.2 µF ceramic capacitor is selected in this circuit.

C_{VCC} : The capacitor on the VCC pin provides noise filtering and stabilizes the internal regulator. It also prevents false triggering of the VCC UVLO. C_{VCC} is recommended to be a 1 µF good quality and low ESR ceramic capacitor.

D_1 : The diode D_1 should have a reverse voltage larger than V_{IN} in the floating buck topology. In this circuit, a 100V diode is selected.

R_{FS} and R_{IADJ} : In this circuit, the switching frequency and LED current are designed to be 300 kHz and 0.5A. From Table 1 and Table 2, R_{FS} is 33.2 kΩ and R_{IADJ} is 3.01 kΩ.

L_1 : The selection of inductor mainly affects the inductor current ripple. In this circuit, we design the peak to peak inductor current ripple to be 50% of I_{LED}, i.e. 0.25A. From (6), L_1 is calculated to be 106 µH, and a 100 µH inductor is selected.

9 Power Supply Recommendation

This device is designed to operate from an input voltage supply range between 4.5 V and 65 V. The input supply should be well regulated. If the input supply is located more than a few inches from the TPS92511 application board, additional bulk capacitance may be required in addition to the input capacitor. A ceramic capacitor with a value of 2.2 µF is a typical choice.

10 Layout

10.1 Layout Guidelines

- The PCB layout of the TPS92511 application circuit plays an important role in optimizing the performance.
- The external components should be placed as close to the TPS92511 as possible to minimize resistance and parasitic inductance of copper traces.
- For example, D_1 and L_1 should be near the LX pin, and C_{VCC} should be near the VCC pin, and the connecting copper traces are short and thick.
- The exposed pad of the TPS92511, which is internally connected to the die substrate, should be connect to a ground plane, and the plane should be extended as much as possible on the same copper layer around the TPS92511.
- Using numerous vias beneath the exposed pad to dissipate heat to another copper layer is also a good practice.

10.2 Layout Example

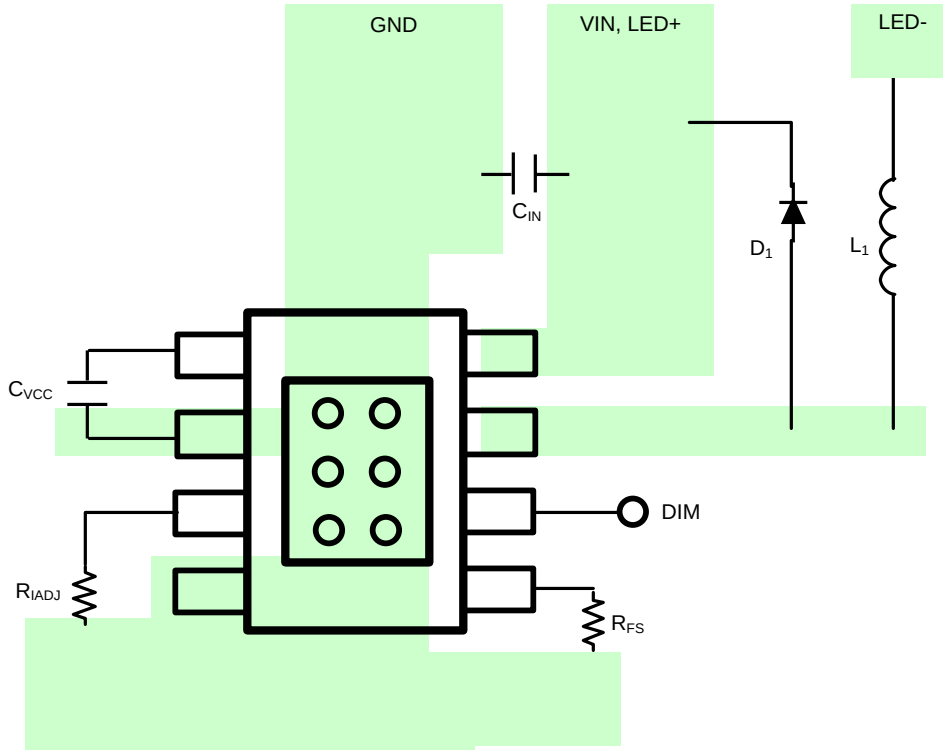

Figure 32. TPS92511 Board Layout

10.2.1 Thermal Consideration

Ψ_{JT} (shown in session 6.4 Thermal Information) is a relatively small value for package with exposed pad since most of the heat is dissipated through the exposed pad to the copper plate of the PCB (assuming optimized PCB layout), relatively little heat goes to the top of the device. The top of the device mold compound temperature is physically close to the device junction temperature.

For example, a 30W output TPS92511 end system at 95% power efficiency (can be estimated from the efficiency curves of Figure 13), power loss is 1.6W. Assuming all the heat is generated from the TPS92511 (which is true for high V_{LED}), and assuming half of the heat generated is dissipated through the top of the device. Now Ψ_{JT} is 11 °C/W, the device junction temperature is estimated to be higher than the package's top-surface temperature by 11 x 1.6 x 0.5 = 8.8 (°C). If the package top-surface temperature is measured to be 90 °C (for example by an IR camera), the device junction temperature is around 99 °C, which is within the 125°C maximum junction temperature requirement with margin.

11 Device and Documentation Support

11.1 Trademarks

All trademarks are the property of their respective owners.

11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.3 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS92511DDA	ACTIVE	SO PowerPAD	DDA	8	95	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 125	92511	Samples
TPS92511DDAR	ACTIVE	SO PowerPAD	DDA	8	2500	Green (RoHS & no Sb/Br)	CU SN	Level-3-260C-168 HR	-40 to 125	92511	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

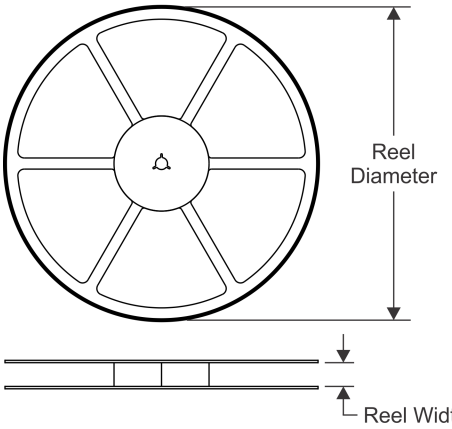
(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

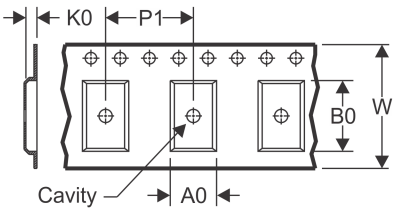
In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

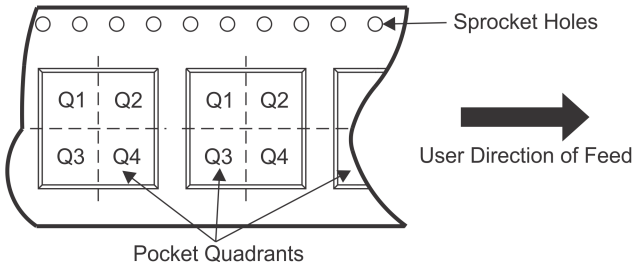


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant

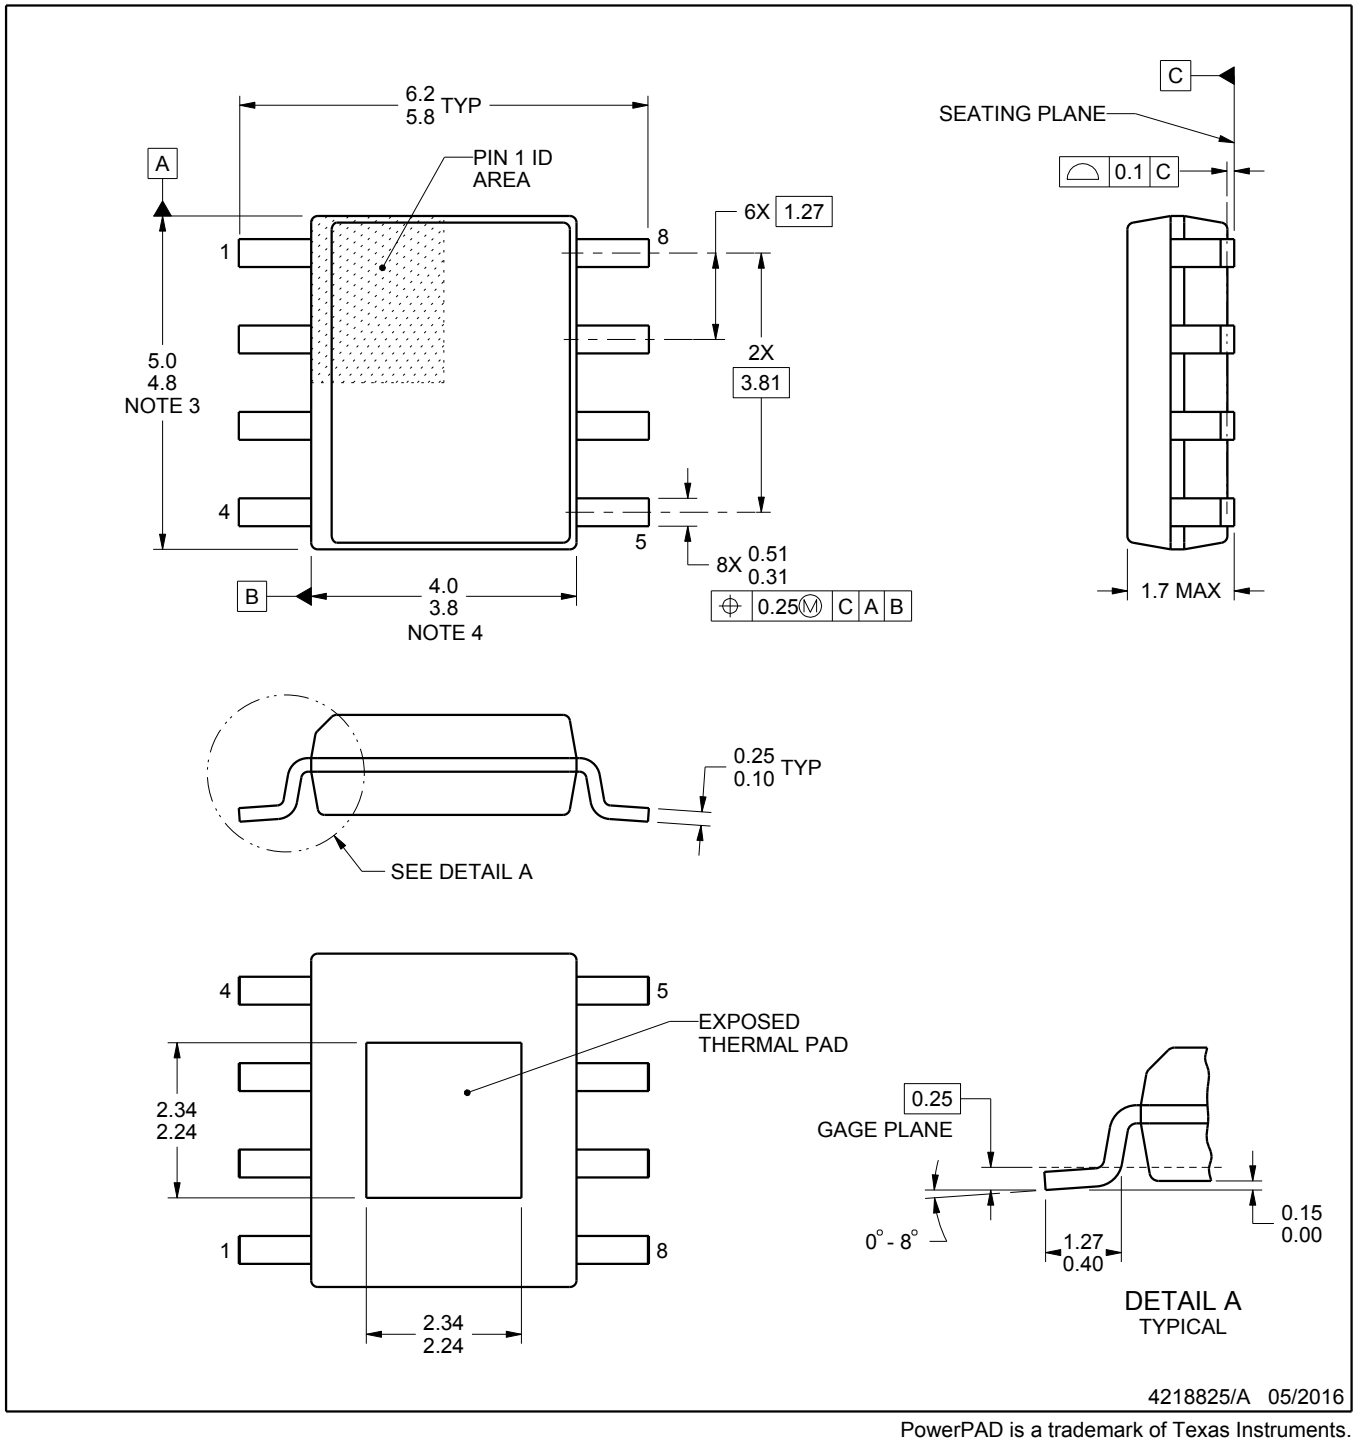
PACKAGE OUTLINE

DDA0008A

PowerPAD™ SOIC - 1.7 mm max height

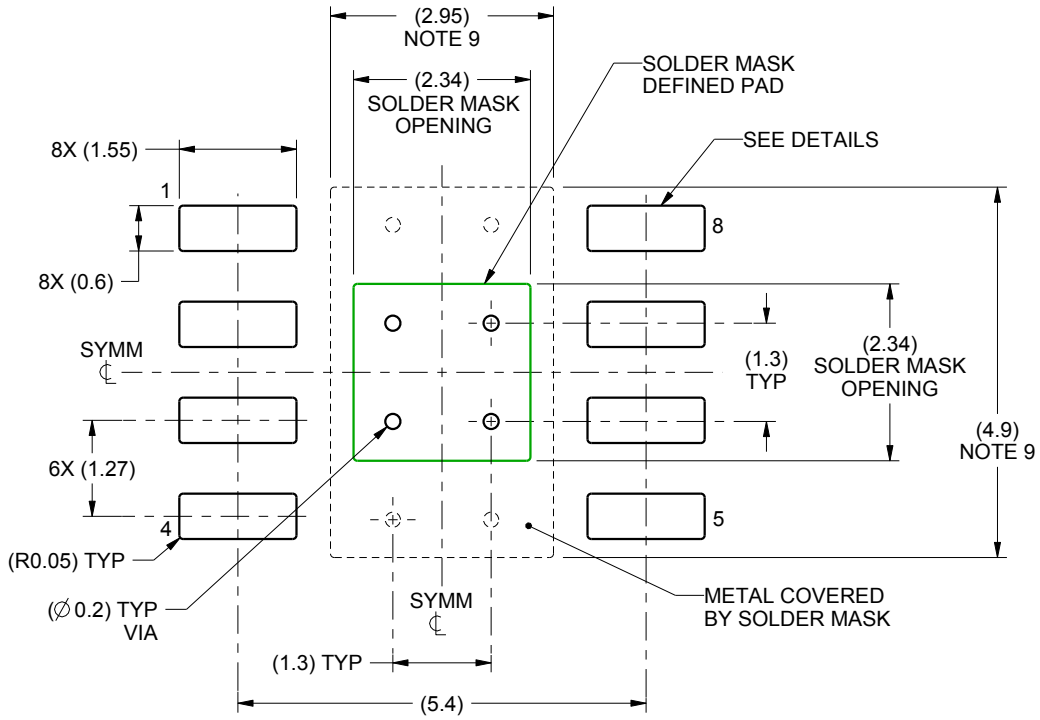
PLASTIC SMALL OUTLINE



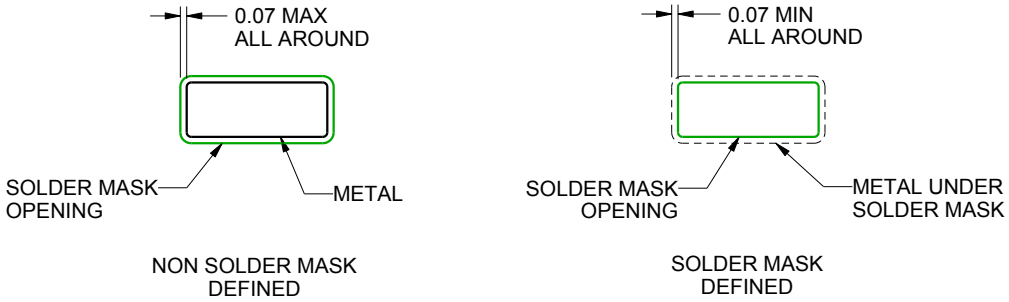
PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MS-012.



LAND PATTERN EXAMPLE
SCALE:10X

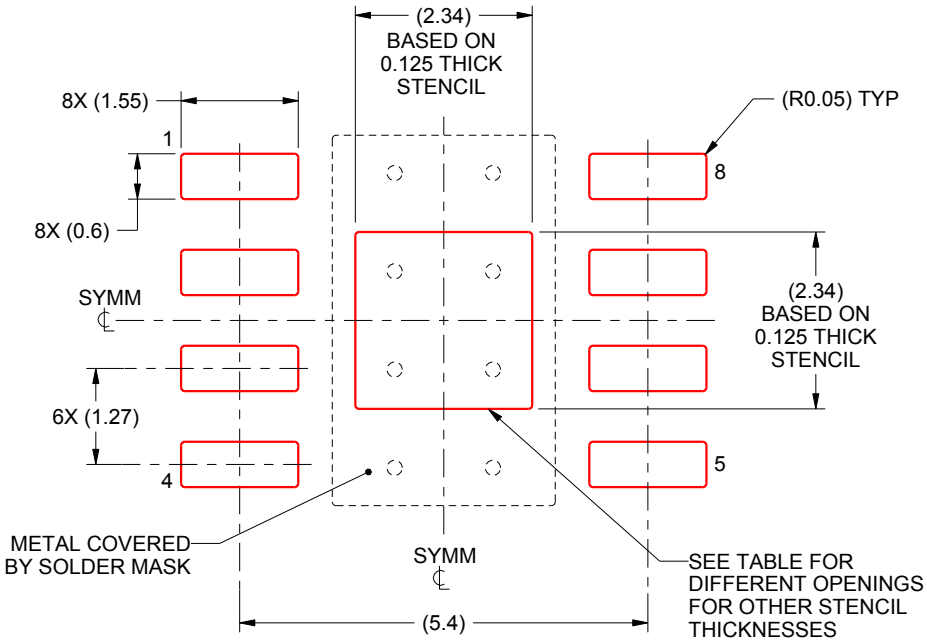


SOLDER MASK DETAILS

4218825/A 05/2016

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature numbers SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Size of metal pad may vary due to creepage requirement.
10. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.



SOLDER PASTE EXAMPLE
