

TRSP(M)5040A/5041S1 OTP-type Speech IC

1. TRSP(M)5040A/5041S1 General Descriptions

TRSP(M)5040A/5041S1 series are 4-bits micro-controller which could play 4 channel melody or 4 channel ADPCM with PWM direct drive circuit. PWM resolution is 8/10/12 bits. They include a low cost, high performance CMOS micro-processor. The clock frequency of this up is typically 8.192 ($\pm 3\%$) MHz. This chip operates over a wide voltage range of 2.0V~5.5V. It contains program ROM (PROM) and data ROM (DROM) inside. The maximum program ROM is 4K words and maximum data ROM size is 120K byte. The maximum working SRAM is (128+2) nibbles. It is provided with total 16 software programmable I/O Ports.

2. TRSP(M)5040A/5041S1 Features

- Operating voltage: **2.0V to 5.5V**
- MCU Operation frequency: **8.192MHz**
- Memory Size
 - Program ROM size: **4K*12-bits OTP type**
 - Data ROM size: **Maximum 120K*8-bits OTP type**
 - SRAM size: **128*4 bits**
 - User register: **2*4 bits**
- Wakeup function for power-down mode:
- HALT mode wakeup source: Port A, Port B, Port D and Port E/CE can wake-up from HALT mode to NORMAL mode and executing wake-up sub-routine program.
- RTC wakeup: Clock source comes from internal LRCOSC, time period 1/16/64/128 ms.
※RTC wakeup function only support in TRSP(M)5041S1.
- 12 input/output pins: Port A, Port B and Port D can be defined as input or output port bit by bit.
- 4 input/output ports or 4 input only ports or 4 output only ports "Port CE/E/C" defined by option:
If input only ports are employed, Port E defined as input only ports.
If output only ports are employed, Port C defined as output only ports.
If input/output ports are selected, Port CE defined as input/output ports bit by bit.
- Four reset condition:
 - Low voltage reset. (LVR = 2.0V)
 - Power on reset.
 - External reset pin. (active low)
 - Watch dog timer overflow.
- One internal interrupt sources:
 - PWM interrupt.
- WDT
 - Watch dog timer, can enabled/disabled by option.
 - WDT period is 256*256*16/Fsys. (WDT period is 0.13 sec for system clock=8.192MHz)
- Audio output:
 - Support PWM or DAC mode by option.
 - Support 8/10/12 bits.
- Support option set for pull down resistor 1M, 50K or 220K Ohm, reset pin (PB3 or PC3), low voltage reset...etc.
- Oscillator fuse option **$\pm 3\%$, temperature & voltage compensation.**
- Support **security option (1 bit)** for read inhibition.
- Support 16-levels LVD function.

TRSP(M)5040A/5041S1 OTP-type Speech IC

3. TRSP(M)5040A/5041S1 Packaging and Pads Information

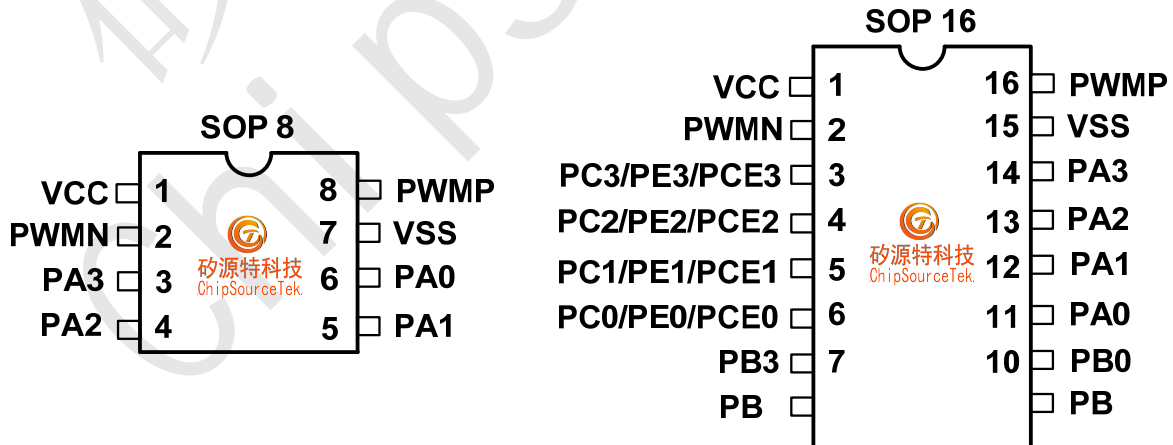

3.1 Pads

| PAD Name | Type | State After Reset | Description |
|---------------------------------|---------------|----------------------|--|
| Reset, Power Input | | | |
| VCC | P | High | Power input of I/O port. |
| VSS | P | Low | Ground input except PWM block power. It could be double bonded with VPS pad. |
| VPD | P | High | PWM block power input in normal operation. |
| VPS | P | Low | The ground pad of PWM block. It could be double bonded with VSS pad. |
| General I/O ports | | | |
| PA3~PA0 | I/O | zzzz | Port A is a programmable input/output port. |
| PB3~PB0 | I/O | zzzz | Port B is a programmable input/output port. PB3 can be employed as reset pin according to the option. |
| PD3~PD0 | I/O | zzzz | Port D is a programmable input/output port. (Only supported for TRSP(M)5041S1) |
| PE3~PE0 PC3~PC0 PCE3~PCE0 | I O I/O | zzzz 0000 zzzz | Port E is an input only port defined by option. Port C is an output only port defined by option, PC3 can be employed as reset pin according to the option. Port CE is a programmable input/output port defined by option, PCE3 can be employed as reset pin according to the option. |
| Audio output pads | | | |
| PWMP | O | Low | Audio output PWM(+). |
| PWMN | O | Low | Audio output PWM(-). |

Table 1: Pad Description

3.2 Package

TRSP(M)5040A provides SOP8 and SOP16

TRSP(M)5040A/5041S1 OTP-type Speech IC

TRSP(M)5041S1 provides SOP8, SOP16, SSOP24

3.2.1 SOP8

4. TRSP(M)5040A/5041S1 ELECTRICAL CHARACTERISTICS

4.1 Absolute Maximum Ratings

| Parameters | Symbol | Value | Unit |
|-----------------------------|--------|-----------------|------|
| DC Supply Voltage | Vcc | -0.5 to 6.0 | V |
| Input Voltage | Vin | -0.5 to Vcc+0.5 | V |
| Operating Temperature Range | Ta | 0 to +75 | °C |
| Storage Temperature Range | Tstg | -25 to +85 | °C |

Table 2: Absolute Maximum Ratings

4.2 AC Characteristics

VCC=3.0V, Ta=25°C unless otherwise noted.

| Parameters | Symbol | Minimum | Typical | Maximum |
|-------------------------------------|--------|----------|-----------|---------|
| Operating Frequency(RC Oscillator) | Fsys | 7.946MHz | 8.192 MHz | 8.43MHz |
| RC reset time-constant | Trrc | - | 10 us | - |
| Data ROM data ready time | Tdrr | - | - | 2/Fsys |

Table 3: AC Characteristics

TRSP(M)5040A/5041S1 OTP-type Speech IC

4.3 DC Characteristics

VCC=3.0V, Ta=25°C unless otherwise noted.

| Parameters | Symbol | Minimum | Typical | Maximum | Condition |
|--|--------|----------|----------|---------|---|
| Power supply range | Vcc | 2.0 V | - | 5.5 V | |
| OTP Programming Power | Vpp | 9.5 V | 10 V | 10.5 V | VCC = 4.8V |
| Supply current | Iop | | 5mA | | System clock 8.192MHz PWM disabled |
| Stand-by Current | IstBY | | 3uA | | VCC=5.0V, MCU halt System clock off |
| Input high voltage | Vih | | 0.55 VCC | | |
| Input low voltage | Vil | | 0.55 VCC | | |
| Input leakage current | Iik | | 0.1 uA | | |
| Output high voltage | Voh | 0.95 VCC | | | no load |
| Output low voltage | Vol | | | 0.05 V | no load |
| Output high current in high source capacity mode | Ioh0 | | 20mA | | Vout=2.0 all ports High source capacity |
| Output low current in high sink capacity mode | Iol0 | | 20mA | | Vout=1.0 all ports High sink capacity |
| Output high current in normal source capacity mode | Ioh1 | | 4mA | | Vout=2.0 all ports Normal source capacity |
| PWM output load | | - | | 8 ohm | Speaker impedance |
| Pull up resistor of PB3, PC3 | Rrst | - | 50K Ohm | - | Pins with pull up PB3 or PC3 reset pins Vin=0V |
| Pull-down resistance | Rpd1 | - | 50K Ohm | - | Pins with pull-down PA, PB and PE Vin=3.0V |
| Pull-down resistance | Rpd2 | | 220K Ohm | | Pins with pull-down PA, PB and PE, Vin=3.0V |
| Pull-down resistance | Rpd3 | | 1M Ohm | | Pins with pull-down PA, PB and PE, Vin=3.0V |
| Threshold voltage of low voltage reset circuit | Vlvr | | 2.0V | | Low voltage reset circuit can't be disabled |

Table 4: DC Characteristics

5. TRSP(M)5040A/5041S1 FUNCTIONAL DESCRIPTION

This chapter describes the function of MCU.

5.1 Program ROM (PROM)

The PROM is an OTP (One Time Programmable) type memory. The **PROM is 4K*12-bits (0000H ~ 1FFFH)** which stores execution program. The last 256 location of effective PROM is reserved area, the user shall not use this area in any case. Assembler shall check user program on this limit. Hardware does not need to check this restriction.

In order to reserved unused area of PROM. These regions maybe use in the future. There is one option "OTPREV" for this purpose. If all unused area of PROM wanted to fill with "0xFFF", the option "OTPREV" on IDE tool must be enabled. Otherwise, they will fill with "0x000".

TRSP(M)5040A/5041S1 OTP-type Speech IC

| PROM address | Function description |
|---------------|----------------------|
| 0x000 ~ 0x001 | Reset |
| 0x004 ~ 0x005 | Wake-up |
| 0x008 ~ 0x009 | Interrupt |
| 0x00A ~ 0xEFF | User code |
| 0xF00 ~ 0xFFF | Reserve area |

Table 3: Memory Map of PROM

5.2 Data ROM (DROM)

The DROM is an OTP (One Time Programmable) type memory. The maximum **DROM is 120K*8-bits** which stores the 8-bits wide data for ADPCM or melody data ...etc. The last 64 location is a reserved area. The user shall not use this area in any case. Assembler shall check user data ROM on this limit. Hardware does not need to check this restriction.

| DROM address (DMA) | Function description |
|--------------------|--|
| 0x00000 ~ 0x000FF | User area |
| 0x00100 ~ 0x001FF | User area |
| 0x00200 ~ 0x002FF | User area |
| ... | ... |
| 0x1DFB0 ~ 0x1DFBF | User area (Max. size of TRSP(M)5040A/5041S1) |
| 0x1DFC0 ~ 0x1DFFF | System area, last 64 location(don't use it) |

Table 4: Memory Map of DROM

DROM is addressed by five registers DMA4, DMA3, DMA2, DMA1 and DMA0. After these registers are specified by software, the data need enough delay time, T_{dr} in the table of "AC Characteristics". After this delay time, the data can be read from data register (DMDL & DMDH).

Ex:

```
LD    (DMA0), A
...
LD    (DMA4), A    ; Set DMA0~4
LD    A, (DMDL)   ; Read low nibble data from DROM, address as DMA4~0.
LD    A, (DMDH)   ; Read high nibble data from DROM, address as DMA4~0.
```

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|--------|------|----------|-------|--------|--------|--------|--------|--|
| DMA0 | 18H | R/W | xxxx | DMA0.3 | DMA0.2 | DMA0.1 | DMA0.0 | DMA0~4, five register built a 20-bits addressing space for read DROM 8-bits data. DMA0 is lowest nibble, DMA4 is highest nibble of DROM address. |
| DMA1 | 19H | R/W | xxxx | DMA1.3 | DMA1.2 | DMA1.1 | DMA1.0 | |
| DMA2 | 1AH | R/W | xxxx | DMA2.3 | DMA2.2 | DMA2.1 | DMA2.0 | |
| DMA3 | 1BH | R/W | xxxx | DMA3.3 | DMA3.2 | DMA3.1 | DMA3.0 | |
| DMDL | 1CH | R/W | xxxx | DMDL.3 | DMDL.2 | DMDL.1 | DMDL.0 | Low nibble of DROM data read from this address. |
| DMDH | 1DH | R/W | xxxx | DMDH.3 | DMDH.2 | DMDH.1 | DMDH.0 | High nibble of DROM data read from this address. |
| | | | | | | | | Write this register means reset watch dog timer if this timer is enabled by option. |
| DMA4 | 1EH | R/W | xxxx | - | - | - | DMA4.0 | DMA4 is highest nibble of DROM address |

Table 5: SFRs about DROM

TRSP(M)5040A/5041S1 OTP-type Speech IC

5.3 SRAM and Special Function Register

5.3.1 SRAM

There are 128 nibbles SRAM in this chip. The SRAM and I/O memory map is divided into several pages by setting MAH register (2-bits wide). The initial value of MAH is unknown and must be defined by instructions “LDMAH” before you utilize SRAM. The extra 2 SRAM nibbles in the specifications and hardware manuals of relative mask ROM products are not SRAM in fact. They are USER1 and USER2 of SFRs.

| Direct Addressing | | SRAM MAP |
|-------------------|---------|---|
| MAH=XH | 00H~1FH | SFR(special function register) register |
| MAH=0H | 20H~3FH | USER SRAM |
| MAH=1H | 20H~3FH | |
| MAH=2H | 20H~3FH | |
| MAH=3H | 20H~3FH | |

Table 6: Memory Map of SFRs

The first 32-nibble, 00H ~ 1FH, are defined as a common block. Some I/O and user register is arranged in this common block for easy data operations. The other regions, 20H~3FH, are employed as SRAM. The user must notice that the initial content of SRAM is unknown.

5.3.2 Special Function Registers

The special function register consists of common I/O and other special register. A special function register supports LD/ADC/SBC/OR/AND/XOR/INC/DEC/RLC/RRC/CMP/ADR operation. Bit set/clear can only be operated on the address range from 00H to 0FH, except indirect operation is used. The following table describes all of the SFRs.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|---------------------|------|----------|-------|----------|----------|----------|----------|---|
| STATUS | 00H | R/W | 00xx | reserved | PWFG | CF | ZF | Status Register PWFG: PWM interrupt flag. CF: Carry flag. ZF: Zero flag. |
| IOC_PCE | 01H | R/W | 0000 | IOC_CE3 | IOC_CE2 | IOC_CE1 | IOC_CE0 | Enable when option “PCEIO” selected. “1” = output, “0” = input of related PE bit. |
| IOC_PA | 02H | R/W | 0000 | IOCA3 | IOCA2 | IOCA1 | IOCA0 | “1” = output, “0” = input of related PA bit. |
| DATA_PA | 03H | R/W | xxxx | DPA3 | DPA2 | DPA1 | DPA0 | Read from Port A input port and write to output port. |
| DATA_PC DATA_PCE | 04H | R/W | 0000 | DPC3 | DPC2 | DPC1 | DPC0 | Port C is output port only. Write to Port C output port. |
| IOC_PB | 05H | R/W | 0000 | IOCB3 | IOCB2 | IOCB1 | IOCB0 | “1” = output, “0” = input of related PB bit. |
| DATA_PB | 06H | R/W | xxxx | DPB3 | DPB2 | DPB1 | DPB0 | Read from Port B input port and write to output port. |
| USER1 | 07H | R/W | xxxx | USER1.3 | USER1.2 | USER1.1 | USER1.0 | General purpose user register. |
| AUD_DLL | 08H | W | xxxx | AUD_DLL3 | AUD_DLL2 | AUD_DLL1 | AUD_DLL0 | AUD_DLL[3:2]: The bit1~0 of 10-bits PWM, combine with AUD_DL[3:0], AUD_DH[3:0] to built 10-bits PWM if option PWM10 is 1 and PWM12 is 0. AUD_DLL[3:0]: The bit3~0 of 12-bits PWM, combine with AUD_DL[3:0], AUD_DH[3:0] to built 12-bits PWM if option PWM12 is 1. |

| | | | | | | | | |
|----------|-----|-----|------|----------|----------|-------|-------|--|
| PWM_CTRL | 09H | R/W | --x0 | reserved | reserved | ENINT | ENPWM | ENPWM: "1" Enable PWM, "0" Disable PWM. ENINT: Enable global interrupt. |
|----------|-----|-----|------|----------|----------|-------|-------|--|

Table 9: SFRs about Interrupt

If the global interrupt enable bit (INTEN) is high and interrupt request (PWFG=1) occurred, then interrupt will be accepted on next clock. On that instant, current (next) program counter, PCDH, MAH and C/Z will be stored in special hardware registers, and program counter will be loaded with entry address of that interrupt. All these are done in one clock. Interrupt enable bit will be cleared too. As long as program enters interrupt service, interrupt enable bit is cleared. It's no need to clear interrupt enable flag in interrupt routine. But hardware will not clear interrupt request flag (PWFG). Software is required to clear it.

When interrupt service routine is done, an RETI shall be executed. This instruction will restore stored program counter, PCDH, MAH and C/Z, will set interrupt enable bit=1 also. (Note that RETI is different from RETS.) Interrupt request can be accepted only when enable bit be set. Note that only one level of INT routine can be used.

5.6 Clock Operation

There are two operation modes in this chip. The state diagram of three MCU operation modes is shown below:

1. NORMAL Mode: In normal mode, system clock oscillator is running, and MCU clock source is come from main oscillator. In NORMAL mode, MCU will go to halt mode after HALT instruction executed.

2. HALT Mode: In HALT mode, the MCU clock stops, users can't change the operation mode when in halt mode. It will go back to NORMAL mode (Program counter=0x004) when I/O wakeup or reset occurred. Please refer to the section of "Halt Mode & Wake up" for the detailed HALT mode description.

Figure 2: Clock Operation Mode

5.7 Halt Mode & Wake up

The MCU is changed into HALT mode (program counter and system clock stop) when HALT instruction executed. It provides a power saving mode for those applications requiring a very low stand-by current. The PA[3:0], PB[3:0] and PE[3:0] are supporting the wake-up function when rising edge occurred.

The program counter will be 0x004 when HALT instruction executed immediately, then program counter will go to next address after 64 stable clock(system clock) when wake up condition occurred. Reset signal will release HALT state and execute reset procedure because reset is first priority when in HALT mode, so program counter will from 0x004 to 0x000, program counter goes to next address after 64 stable clock cycles. Furthermore, the SRAM will keep their previous data without changing in this mode.

TRSP(M)5040A/5041S1 OTP-type Speech IC

5.8 Watch Dog Timer Reset (WDT)

The **Watch Dog Timer (WDT)** is used to reset whole chip when detect unexpected execution sequence caused by accident condition, avoiding dead lock of MCU program. WDT will be reset when wake-up from halt, after reset or software clears it. The watch dog timer is a simple counter. It has a fixed length of **256*256*16/system-clock (ex: 0.13 sec for 8.192MHz system clock)** after the clearance of watch dog.

Software must run a "clear watch dog timer" (write to DMDH) instruction before this timer time out when WDT enabled. It will generate a reset signal to reset whole system when WDT over flow. Assembler will check user program about the "reset watch dog" instructions. If more than one "reset watch dog" is found in program, assembler will generate a warning (program code will still be generated). "HALT" instruction will reset watch dog timer. The reset watch dog timer sequence is strongly recommended as:

```
WATCHDOG:
                LD        (1DH), A
```

5.9 Low Voltage Detect (LVD)

The low voltage detect (LVD) function is used to detect whole chip power supply VCC. TRSP(M)5040A/5041S1 support 16-level LVDS[3:0] to selected detect voltage level, the detected voltage range is from 3.8V to 2.1V.

There have one control register LVDEN used to enable/disable the low voltage detect function. The flag signal LVD_FLAG is used to check the power supply VCC upper or under than low voltage detect level, when VCC upper than LVD level, the flag LVD_FLAG value is low; otherwise, the flag LVD_FLAG value is high when VCC under than VCC.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|----------|------|----------|-------|-------|-------|--------------|-------|---|
| LVD_CTRL | 13H | R/W | 0000 | - | - | LVD_FLAG (R) | LVDEN | LVD_FLAG: (Read only) The flag of LVD, '1'=LVD sensing. LVDEN: '1'=Enable LVD function, '0'=Disable LVD function. |

5.10 8/10/12 Bits PWM/DAC

There are three optional PWM/DAC output resolutions. One is 8-bits output, the sec. is 10-bits output, and the other is 12-bits output. The highest of input data is signed bit: '0' represents positive, '1' represents negative.

TRSP(M)5040A/5041S1 supports audio output with PWM and DAC two modes. These two modes can be selected by "DACEN" option. If use DAC output mode, option "DACEN" must be enabled. Otherwise, PWM mode is enabled. All PWM registers will be exchanged for DAC mode if "DACEN" option is enabled.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |

Table 10: SFRs about the operation of PWM

5.10.1 8-Bits PWM/DAC

This PWM is 8-bits output resolution. An interrupt request happened when a PWM cycle completed.

The MSB of AUD_DH is signed bit, '0' for positive, '1' for negative. PWM output frequency (sample rate) is fixed at 32KHz. PWM data registers are AUD_DL, AUD_DH. The AUD_DL is low nibble (D3 ~ D0). AUD_DH is high nibble (D7 ~ D4). D7 is the signed bit and D6 ~ D0 is the length (clock number) of output active pulse. Software should write AUD_DL and AUD_DH before enable PWM.

When an interrupt request happened, PWM interrupt flag bit PWFG of STATUS register will be "1". The PWM will load previously-written-data into actual conversion port on end of a PWM code output. So program can write data into PWM data store safely at beginning of an interrupt service routine. (A PWM interrupt means PWM data loaded, next data is expected). This timing shall be controlled carefully such that data writing in the beginning of interrupt service routine is safe. If data is not changed during a conversion, previous data will be used.

This PWM output can drive 8 ohm speaker. PWM can be enabled or disabled by setting/clearing ENPWM of PWM_CTRL. When disabled, the PWMP, PWMN pins are all '0'. "HALT" instruction will disable PWM (clear ENPWM of PWM_CTRL) and the PWMP and PWMN pins will be tri-state.

5.10.2 10-Bits PWM/DAC

The frequency of PWM clock is fixed at 32 KHz if 10-bits PWM mode is selected by option. The 10-bits PWM data (AUD_DH[3:0], AUD_DL[3:0], AUD_DLL[3:2]) are consist of AUD_DH, AUD_DL, AUD_DLL three registers shown above. The data rage is 0 ~511. Software should write these registers before PWM is enabled. The other features of 10-bits PWM is the same as 8-bits PWM.

5.10.3 12-Bits PWM/DAC

The frequency of PWM clock is fixed at 32 KHz if 12-bits PWM mode is selected by option "PWM12S". The 12-bits PWM data (AUD_DH[3:0], AUD_DL[3:0], AUD_DLL[3:0]) are consist of AUD_DH, AUD_DL, AUD_DLL three registers shown above. The data rage is 0 ~ 2047. Software should write these registers before PWM is enabled. The other features of 12-bits PWM is the same as 8-bits PWM.

Note: To avoid sound "Bo", please reference application note on web site.

TRSP(M)5040A/5041S1 OTP-type Speech IC

5.10.4 Speaker Provided a Wake-up Control Function

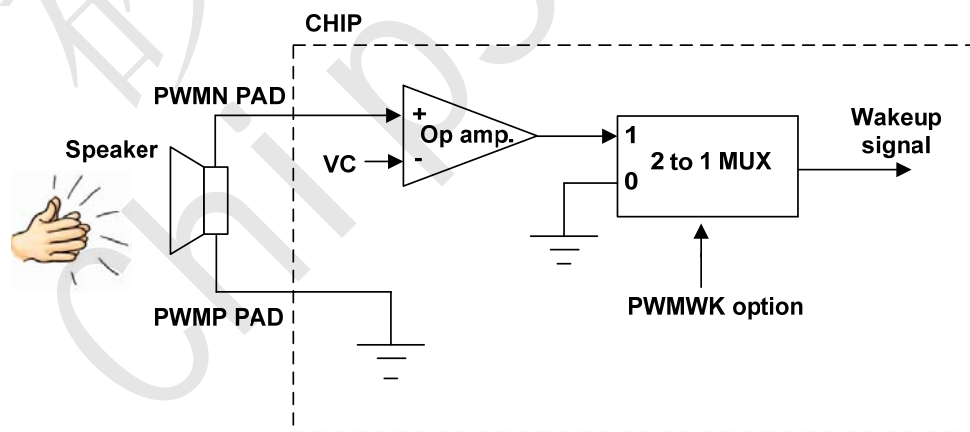

Normally, the PWMN and PWMP pin is tied to a speaker for playing music and a sound. This speaker connection structure can be used to wake-up MCU. If PWMWK is enabled, the speaker wake-up function is enabled after go into HALT mode and the PWM function keep operating in normal mode. If speaker wake-up function is enabled, the PWMP pin will be fixed to VSS level and PWMN pin also will be fixed to VSS level by chip. The signal level on PWMN pin will be changed (typically 0mV~10mV) when a sound receives from speaker. The MCU will be waked up if signal level on PWMN pin high enough. The relationship between wake-up signal and PWMN pin is shown in picture below. The wake-up signal goes high if PWMN pin larger than VC level and it goes low if PWMN pin smaller than VC level.

Note:

1. This function consume about 5uA (VDD=5V) typically in HALT mode when “PWMWK” option is enabled.
2. PWM function must be keep silence about 200ms before go into HALT mode. Otherwise, MCU maybe keep in normal mode, not goes into HALT mode.
3. When PWMWK option enabled, PA0 wakeup option must be disabled, please referenced AN-0068_V2.0.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description | | | | | | | | | | |

Table 13: SFRs about the operation of speaker wakeup function

Wakeup control block diagram and speaker trigger application circuit

Figure 3: Speaker wakeup structure

TRSP(M)5040A/5041S1 OTP-type Speech IC

Input signal of speaker vs. Wakeup signal waveform

Figure 4: Speaker wakeup waveform

Notice: Speaker wakeup function, please reference application note “AN-0068_V1.0” on web site.

5.11 Real time clock interrupt (RTC)

RTC function is enabled by RTCEN register. If RTCEN register is enabled, It's will keep running at NORMAL and HALT mode. If MCU is in HALT mode, RTC overflow will wake-up chip and jump to address \$004h.

Notice: RTC wakeup function only support in TRSP(M)5041S1.

Common I/O of RTC:

| Symbol | Addr | R/W | Reset | D3 | D2 | D1 | D0 | Description |
|--------|------|-----|-------|--------|--------|--------|--------|---|
| RTC | 16H | R/W | 0000 | RTCFCG | RTCEN | RTCS1 | RTCS0 | In HALT mode, RTC can wake up MCU and program will go to wake up vector (\$004h). RTCFCG: RTC overflow flag. 0: RTC overflow not occurred. 1: RTC overflow occurred, it can be cleared by software. RTCEN, RTC function enable/disable, '1'=Enable, '0'=Disable. RTCS[1:0], RTC period select. [1,1]: 128ms, [1,0]: 64ms. [0,1]: 16ms, [0,0]: 1ms. |
| DMDH | 1DH | R/W | xxxx | DMDH.3 | DMDH.2 | DMDH.1 | DMDH.0 | Write this register with data #Ah will clear RTC counter. |

The RTCFCG flag is set every 1m sec ~ 128m sec as below:

| RTCS1 | RTCS0 | RTC Period |
|-------|-------|------------|
| 0 | 0 | 1ms |
| 0 | 1 | 16ms |
| 1 | 0 | 64ms |
| 1 | 1 | 128ms |

Table 14. RTCS1,RTCS0: RTC interrupt period selection

TRSP(M)5040A/5041S1 OTP-type Speech IC

RTC_CFG flag will be cleared by software. This RTC timer can be used in applications that required to wakeup periodically in HALT mode. The RTC clock source is come from LRCOSC oscillator and the frequency is 100KHz. Besides, RTC counter value also support clear function by writing "#Ah" data to register DMDM (\$1DH).

Notice: RTC wakeup time accuracy is about $\pm 50\%$

5.12 Reset Function

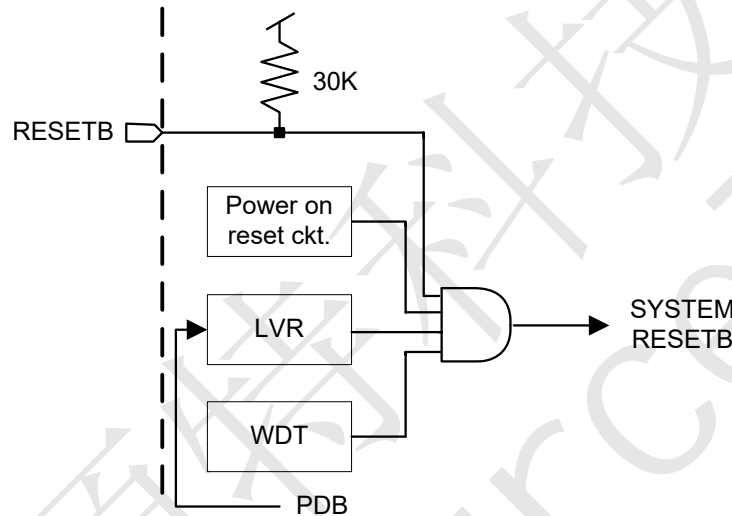

Figure 5: Reset structure

The system reset is come from four signals which are **Power on reset**, **Low voltage reset(LVR)**, **External RESETB pin** and **WDT overflow reset**.

Some reset input pins PB3 and PC3, can be provided to reset this chip according to your option. These pins have 30K Ohm pull up resistor. For normal operation of this chip, a good reset is needed. The operation frequency of MCU will go back to normal mode when reset occurred in HALT mode.

5.13 System Clock Oscillator

This chip MCU is typically operated on 8.192MHz which is generated from internal RC oscillator 32MHz.

5.14 I/O Ports

There are three I/O ports, PA3~PA0, PB3~PB0 and PE3~PE0, whose input/output direction are defined by IOC_PA, IOC_PB and IOC_PCE. PE3~PE0 are input only ports or input/output ports direction defined by IOC_PCE be selected by option. The wake-up functions of PA3~PA0, PB3~PB0 and PE3~PE0 are enabled or disabled by option. All I/O ports provides rising or falling edge wake up function. This double edge wake up function can be enabled by "BIWK" option. Their 1M/50K Ohm pull down resistors are optional.

In order to achieve touch function, TRSP(M)5040A/5041S1 support 220K Ohm pull down resistors. These resistors can be enabled by using 50K Ohm pull down resistor registers after "PD220K" is enabled. The 220K Ohm resistance value is almost fixed value when VCC change from 2.0V to 5.5V.

TRSP(M)5040A/5041S1 OTP-type Speech IC

5.14.1 Port PA (input/output)

The Port A is 4-bits bidirectional I/O port. Their directions can be defined by IOC_PA bit by bit. The following table describe the SFRs associated with Port A.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|---------|------|----------|-------|-------|-------|-------|-------|---|
| IOC_PA | 02H | R/W | 0000 | IOCA3 | IOCA2 | IOCA1 | IOCA0 | "1" = output, "0" = input of related PA bit. |
| DATA_PA | 03H | R/W | xxxx | DPA3 | DPA2 | DPA1 | DPA0 | Read from Port A input port and write to output port. |

Table 15: SFRs of Ports PA

In output mode, the data can be written out to external pin, and reading this output port will read the data internal latch. Pull-down resistor will be disabled when output mode is selected.

In input mode, Port A and Port B data can be read from external pin, and they are attached with 1M/50K Ohm pull-down resistor or not according to the options.

In addition, each pin of Port A and Port B also can be accompanied with wake-up function according to the options. In HALT mode, if some bits of Port A or Port B are accompanied with wake-up function, any rising edge occurred on that pin will wake up system and turn on oscillator, and the program counter of MCU will jump to the address 0x004. This device will start to execute the wake-up sub-routing.

PA3 is provided with 38KHz modulator

I/O port PA3 built-in a 38KHz modulator combined with register DATA_PA bit-3, this function is enabled by "F38K" option. If F38K option is enabled, I/O port PA3 will output 38KHz clock signal when PA3 is configured as output port and DATA_PA bit-3 = 1. PA3 output low when PA3 is configured as output port and DATA_PA bit-3 = 0.

Notice: The PA3 output pad will be forced to low state automatically by hardware control when in halt mode for avoid external IR LED destroyed. Besides, the F38K option disabled, PA3 is a normal I/O port.

PA0 is provided with an analog input (Schmitt) for wake-up control

PA0 supports an analog input buffer with Schmitt circuit, it is enabled by "RCWK" option and supports low power consumption in halt mode, if PA0 analog signal keep about 0.5*VCC, so this function is suitable for recycle wakeup MCU by external RC time constant, external RC time constant is easy built by VCC connected to R and serial with C to VSS.

The block diagram and electrical characteristic of PA0 analog input buffer shown below. It takes about 5uA when PA0 input signal is 2.5v @VCC=5V in halt mode, otherwise, it takes about 500uA current if RCWK option disabled. This block function is enabled when RCWK option enabled by hardware after power on reset.

TRSP(M)5040A/5041S1 OTP-type Speech IC

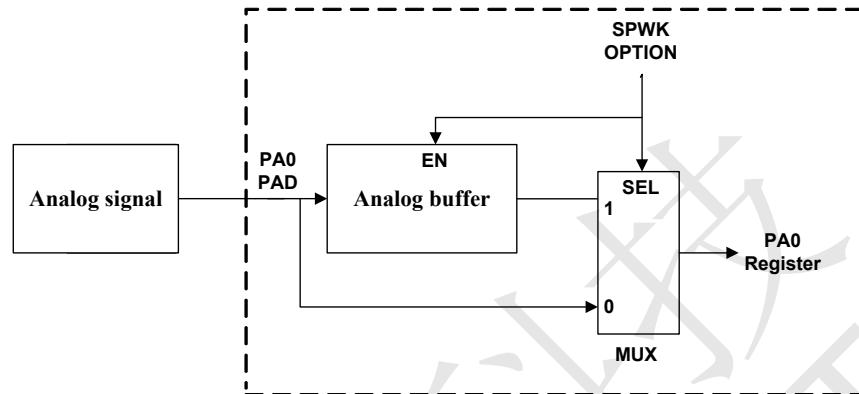

Figure 6. PA0 analog input structure

Figure 7. PA0 input signal and PA0 register data

PA0 is provided with an analog input (OP Amp.) for wake-up control

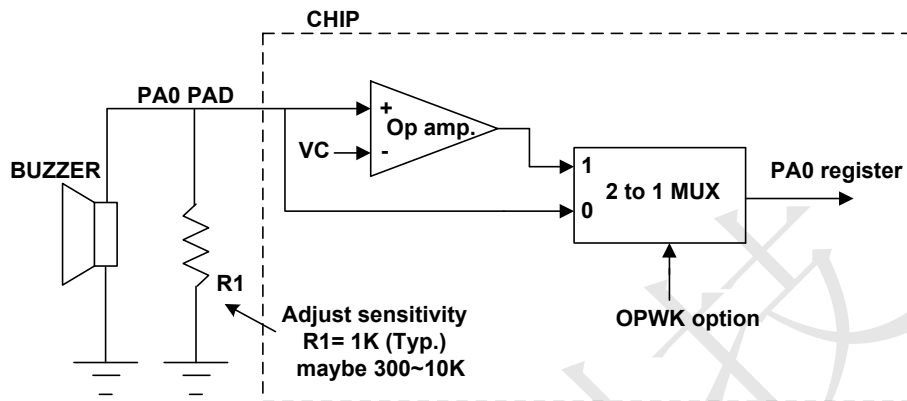

It built-in an OP amplifier for wake-up trigger, the pull down 1M and 50K Ohm resistor will be disabled by hardware circuit when “**BZWK**” option is enabled automatically, PA0 always keep at DC level (bias voltage Vbias) for signal amplify, and Vbias is about 0.8V~1.0V. (Wake-up by analog signal amplifier function is enabled by mask option “**BZWK**”)

This block function is enabled when BZWK option is enabled by hardware after power on reset.

Notice: Buzzer function, please reference application note “AN-0068_V1.0” on web site.

5.14.2 Port PB (input/output)

The Port B is 4-bit bidirectional I/O port. Their directions can be defined by IOC_PB bit by bit.

The following table describe the SFRs associated with Port B.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|---------|------|----------|-------|-------|-------|-------|-------|---|
| IOC_PB | 05H | R/W | 0000 | IOCB3 | IOCB2 | IOCB1 | IOCB0 | "1" = output, "0" = input of related PB bit. |
| DATA_PB | 06H | R/W | xxxx | DPB3 | DPB2 | DPB1 | DPB0 | Read from Port B input port and write to output port. |

Table 16: SFRs of Ports PB

In output mode, the data can be written out to external pin, and reading this output port will read the data internal latch. Pull-down resistor will be disabled when output mode is selected.

In input mode, Port B data can be read from external pin, and they are attached with 1M/50K Ohm pull-down resistor or not according to the options.

In addition, each pin of Port B also can be accompanied with wake-up function according to the options.

In HALT mode, if some bits of Port B are accompanied with wake-up function, any rising edge occurred on that pin will wake-up system and turn on oscillator, and the program counter of MCU will jump to the address 0x004. This device will start to execute the wake-up sub-routing.

TRSP(M)5040A/5041S1 OTP-type Speech IC

5.14.3 Port PD (input/output)

Whether all 4-bits of the Port D are input or output ports depends on IOC_PD control register. They are accompanied with 1M/50K Ohm pull-down resistor or not according to the options if they are in the input mode.

The following table describe the SFRs associated with Port D.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|---------|------|----------|-------|-------|-------|-------|-------|---|
| IOC_PD | 0CH | R/W | 0000 | IOCD3 | IOCD2 | IOCD1 | IOCD0 | "1" = output, "0" = input of related PD bit. |
| DATA_PD | 0DH | R/W | xxxx | DPD3 | DPD2 | DPD1 | DPD0 | Read from Port D input port and write to output port. |

Table 17: SFRs of Port PD

5.14.4 Port PC (output) Selected by option.

The Port C is 4-bits output only port.

The following table describe the SFRs associated with Port C.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|---------|------|----------|-------|------|------|------|------|---|
| DATA_PC | 04H | R/W | 0000 | DPC3 | DPC2 | DPC1 | DPC0 | Port C is output port only. Write to Port C output port. |

Table 18: SFR of Port PC

5.14.5 Port PE (input) Selected by option.

All 4-bits of the Port E are input ports only. They are accompanied with 1M/50K Ohm pull-down resistor or not according to the options.

The following table describe the SFRs associated with Port E.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|---------|------|----------|-------|------|------|------|------|---|
| DATA_PE | 0EH | R/W | xxxx | DPE3 | DPE2 | DPE1 | DPE0 | Port E defined as I/O port or input port depends on option PEIO. Read from Port E input port and write to output port. |

Table 19: SFR of Port PE

5.14.6 Port PCE (input/output) Selected by option "PCEIO".

Whether all 4-bits of the Port E are input or output ports depends on IOC_PCE control register. They are accompanied with 1M/50K Ohm pull-down resistor or not according to the options if they are in the input mode.

The following table describe the SFRs associated with Port CE.

| Symbol | Addr | R/W type | Reset | D3 | D2 | D1 | D0 | Description |
|----------|------|----------|-------|-------|-------|-------|-------|---|
| IOC_PCE | 01H | R/W | 0000 | IOCE3 | IOCE2 | IOCE1 | IOCE0 | Enable when option "PEIO" selected. "1" = output, "0" = input of related PE bit. |
| DATA_PCE | 04H | R/W | 0000 | DPCE3 | DPCE2 | DPCE1 | DPCE0 | Port CE is output port only. Write to Port CE output port. |

Table 20: SFR of Port PCE

TRSP(M)5040A/5041S1 OTP-type Speech IC

There are three modes on Port PCE. They are single OP mode, two comparators mode and comparator & OP mode shown in table below.

| Item | Port PCE Structure | Relative Options | Reference Figure |
|---------------|----------------------|-------------------------|------------------|
| Mode 1 | Single OP mode | OPEN | Figure 10 |
| Mode 2 | Two comparators mode | CMPEN1、CMPEN2、B1RZ、B3RZ | Figure 11 |
| Mode 3 | Comparator & OP mode | CMPEN1、OPEN、B1RZ | Figure 12 |

Table 21: Structure of PCE

These three modes can be enabled by option OPEN, CMPEN1 and CMPEN2. Option B1RZ is used for reading control DATA_PCE1. If B1RZ is enabled, DATA_PCE1 will read always 0. Otherwise, it will read the state of external Port PCE1. Another option B3RZ is the same function as B1RZ. Option B3RZ is used for reading control DATA_PCE3.

Mode1. Single OP mode

Port PCE provides one OP, if option OPEN is enabled. In this mode, the positive, negative input and output pin of OP is configured as below. In order to avoid interference between PCE1 and PCE2 pin, it's recommended PCE1 must be set as input port.

Figure 10. Port PCE mode 1 block diagram

TRSP(M)5040A/5041S1 OTP-type Speech IC

Mode2. Two comparators mode

Port PCE provides two comparators if option CMPEN1 and CMPEN2 are enabled. One of them may be enabled by individual option. In this mode, the positive and negative input of comparator is configured as below.

Figure 11. Port PCE mode 2 block diagram

Option B1RZ is used for reading control DATA_PCE1. If B1RZ is enabled, DATA_PCE1 will read always 0. Otherwise, it will read the state of external Port PCE1. Another option B3RZ is the same function as B1RZ. Option B3RZ is used for reading control DATA_PCE3. The option B1RZ & B3RZ configuration as shown below.

Option CMPEN1 & B1RZ configuration

| CMPEN1 | CMPEN2 & OPEN | B1RZ | Reading DATA_PCE1~0 |
|--------|---------------|------|---|
| 0 | 0 | X | Port PCE is pure I/O port |
| 1 | 0 | 0 | Reading DATA_PCE1 register comes from the PCE1 external Port Reading DATA_PCE0 register comes from the output of comparator1 |
| 1 | 0 | 1 | Reading DATA_PCE1 register is always 0 Reading DATA_PCE0 register comes from the output of comparator1 |

Table 22. Port PCE comparator1 configuration

Option CMPEN2 & B3RZ configuration

| CMPEN2 | CMPEN1 & OPEN | B3RZ | Reading DATA_PCE3~2 |
|--------|---------------|------|---|
| 0 | 0 | X | Port PCE is pure I/O port |
| 1 | 0 | 0 | Reading DATA_PCE3 register comes from the PCE3 external Port Reading DATA_PCE2 register comes from the output of comparator2 |
| 1 | 0 | 1 | Reading DATA_PCE3 register is always 0 Reading DATA_PCE2 register comes from the output of comparator2 |

Table 23. Port PCE comparator2 configuration

TRSP(M)5040A/5041S1 OTP-type Speech IC

Mode3. Comparator and OP mode

Port PCE provides comparator and OP mode if option CMPEN1 and OPEN are enabled. Option CMPEN2 must be disabled. In this mode, the comparator and OP is configured as below. It's suitable for small signal detect used on remote toy car applications.

Option OPEN, CMPEN1 & B1RZ configuration

| OPEN | CMPEN1 | CMPEN2 | B1RZ | Reading DATA_PCE3~0 |
|------|--------|--------|------|---|
| 0 | 0 | 0 | x | Port PCE is pure I/O port |
| 1 | 1 | 0 | 0 | Reading DATA_PCE2 or DATA_PCE3 register is always 0 Reading DATA_PCE1 register comes from the PE1 external Port Reading DATA_PCE0 register comes from the output of comparator1 |
| 1 | 1 | 0 | 1 | Reading DATA_PCE2 or DATA_PCE3 register is always 0 Reading DATA_PCE1 register is always 0 Reading DATA_PCE0 register comes from the output of comparator1 |

Notice:

1. Regarding recording or remote car applications, please reference application note on web site.
2. C1 : 47 uF ~ 100 uF(depends on applications), C2 : 0.1 uF
3. DAC Applications circuit not support PWM wakeup function.
4. DAC Applications, please reference application note on web site.

7. TRSP(M)5040A/5041S1 Option Registers table

| Option Name | Function Description |
|-------------|--|
| RXEN | Remote function |
| BZWK | PA0 buzzer trigger wakeup |
| RCWK | PA0 RC wakeup |
| PWM64K | PWM int. freq. select |
| DACEN | DAC function control |
| WAKEBA | Wake-up enable for PA3~PA0 respectively |
| WAKEBB | Wake-up enable for PB3~PB0 respectively |
| WAKEBD | Wake-up enable for PD3~PD0 respectively. |
| WAKEBE | Wake up enable for PE3~PE0 respectively. |
| PD50KPA | 50K Ohm pull down resistor for PA3~PA0 respectively. |
| PD50KPB | 50K Ohm pull down resistor for PB3~PB0 respectively. |
| PD50KPD | 50K Ohm pull down resistor for PD3~PD0 respectively. |
| PD50KPE | 50K Ohm pull down resistor for PE3~PE0 respectively. |
| PD1MPA | 1M Ohm pull down resistor for PA3~PA0 respectively. |
| PD1MPB | 1M Ohm pull down resistor for PB3~PB0 respectively. |
| PD1MPD | 1M Ohm pull down resistor for PD3~PD0 respectively. |
| PD1MPE | 1M Ohm pull down resistor for PE3~PE0 respectively. |
| FHC | Force output high of PC3~PC0 respectively. |
| FHD | Force output high of PD3~PD0 respectively. |
| RSTBPB3 | PB3 external reset pin |
| RSTBPC3 | PC3 external reset pin |
| WDGENB | Watch dog timer |
| HALTENB | HALT mode control |
| OPEN | OPA @ PCE3(in-),PCE2(in+),PCE0(out) |
| PD220K | Change 50K Ohm pull-down resistor to 220K Ohm |
| CMP #1 | Comparator #1 control |
| CMP #2 | Comparator #2 control |
| PWM12S | PWM 12 bit select |
| PWM10S | PWM 10/8 bit select |
| LOPENC | Output weak low for PC3~PC0 |
| LOPEND | Output weak low for PD3~PD0 |
| OTPLOCK | Security control |
| F38K | PA3 38KHz output |
| BIWK | Bi-directional wake up |
| OPTADJ | OSC IADJ select |
| PCEIO | Port CE I/O mode control |
| HDEN | Driving capacity of output port control |
| PCESEL | Port CE as PC/PE select |
| B3RZ | PE3 mode select when CMP enable |
| B1RZ | PE1 mode select when CMP enable |

TRSP(M)5040A/5041S1 OTP-type Speech IC

8. TRSP(M)5040A/5041S1 The Revision History

| ersion | Description | Page | Date |
|--------|--|------|------------|
| 1.0 | Established | | 2022-05-30 |
| 1.1 | Modify CLAPSEL[1:0] sensitivity definition | 9,14 | 2023-05-25 |

Table 25: Revision History
