

TRIUNE PRODUCTS

Features

- Wide input supply operating range
 - ♦ TS31023 : 5V-16V
 - ♦ TS31223 : 5V-36V
- Adjustable output voltage from 1.25V to $V_{IN} - V_{dropout}$
- 60mA output current capability
- Enable control function

Applications

- Set-top Boxes
- Automotive
- Industrial
- Medical
- Energy harvesting systems
- Wireless Power

Description

The TS31x23 high voltage linear regulator consists of a low power amplifier with a high voltage p-channel pass gate.

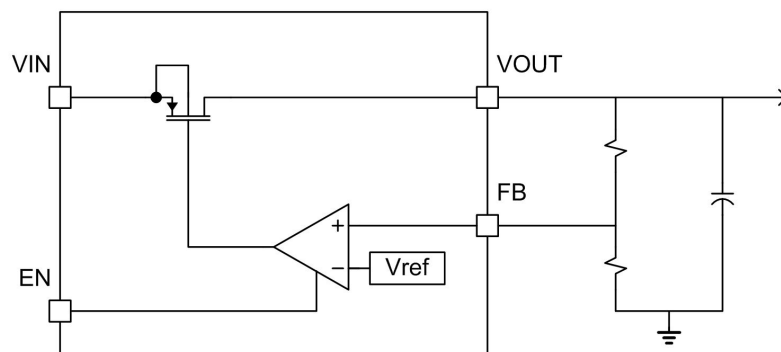

The linear regulator has a wide operating range, and is ideal for systems that may have large voltage transients and require the output load to remain regulated.

An analog current limit is used to limit output current and protect the regulator from external short circuits.

Summary Specification

- Ambient operating temperature 0C to 85C
- Packaged in a 8pin DFN (2x2)

Application Using A Multi-Layer PCB

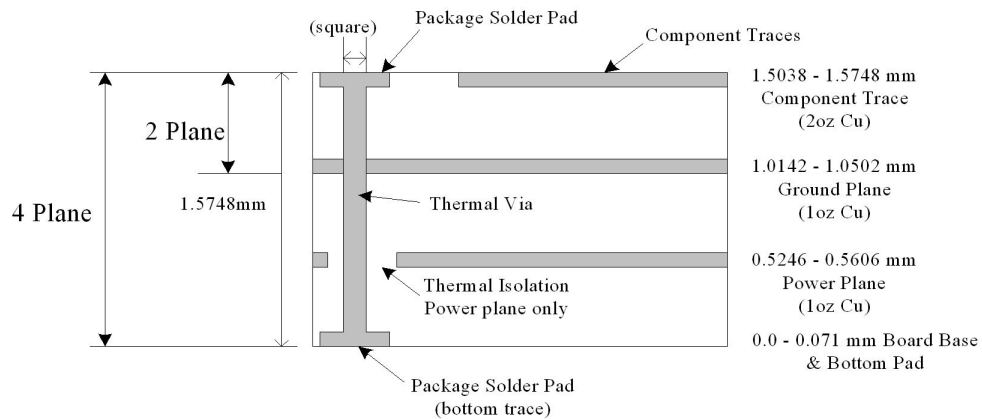

To maximize the efficiency of this package for application on a single layer or multi-layer PCB, certain guidelines must be followed when laying out this part on the PCB.

The following are guidelines for mounting the exposed pad IC on a Multi-Layer PCB with ground a plane.

Package and PCB Land Configuration
For a Multi-Layer PCB

JEDEC standard FR4 PCB Cross-section:

Multi-Layer Board (Cross-sectional View)

In a multi-layer board application, the thermal vias are the primary method of heat transfer from the package thermal pad to the internal ground plane. The efficiency of this method depends on several factors, including die area, number of thermal vias, thickness of copper, etc.

Note: NOT to Scale

The above drawing is a representation of how the heat can be conducted away from the die using an exposed pad package. Each application will have different requirements and limitations and therefore the user should use sufficient copper to dissipate the power in the system. The output current rating for the linear regulators may have to be de-rated for ambient temperatures above 85C. The de-rate value will depend on calculated worst case power dissipation and the thermal management implementation in the application.

Application Using A Single Layer PCB

Layout recommendations for a Single Layer PCB: utilize as much Copper Area for Power Management. In a single layer board application the thermal pad is attached to a heat spreader (copper areas) by using low thermal impedance attachment method (solder paste or thermal conductive epoxy).

In both of the methods mentioned above it is advisable to use as much copper traces as possible to dissipate the heat.

Important:

If the attachment method is NOT implemented correctly, the functionality of the product is not guaranteed. Power dissipation capability will be adversely affected if the device is incorrectly mounted onto the circuit board.

IR Reflow Profile

Profile Feature	Sn-Pb Eutectic Assembly	Pb-Free Assembly

Ramp-down Rate	6 °C/second max.	6 °C/second max.
Time 25 °C to Peak Temperature	6 minutes max.	8 minutes max.

Note 1: All temperatures refer to topside of the package, measured on the package body surface.

Note 2: Time within 5°C of actual peak temperature (t_p) specified for the reflow profiles is a "supplier" minimum and "user" maximum.

Table 4-1 SnPb Eutectic Process - Package Peak Reflow Temperatures

Package Thickness	Volume mm ³ < 350	Volume mm ³ ≥ 350
< 2.5mm	240 +0/-5 °C	225 +0/-5 °C
≥ 2.5mm	225 +0/-5 °C	225 +0/-5 °C

Table 4-2 Pb-free Process - Package Peak Reflow Temperatures

Package Thickness	Volume mm ³ < 350	Volume mm ³ 350 - 2000	Volume mm ³ > 2000
< 1.6mm	260 °C*	260 °C*	260 °C*
1.6mm - 2.5mm	260 °C*	250 °C*	245 °C*
> 2.5mm	250 °C*	245 °C*	245 °C*

* Tolerance: The device manufacturer/supplier shall assure process compatibility up to and including the stated classified temperature at the rated MSL level

Note 1: Package volume excludes external terminals (balls, bumps, lands, leads) and/or non-integral heat sinks.

Note 2: The maximum component temperature reached during reflow depends on package thickness and volume. The use of convection reflow processes reduces

the thermal gradients between packages. However, thermal gradients due to differences in thermal mass of SMD packages may still exist.

Note 3: Components intended for use in a "lead-free" assembly process shall be evaluated using the "lead-free" peak temperature and profiles defined in Tables 4-1, 4.2 and 5-2 whether or not lead free.

RoHS and Reach Compliance

Triune Systems is fully committed to environmental quality. All Triune Systems materials and suppliers are fully compliant with RoHS (European Union Directive 2011/65/EU), REACH SVHC Chemical Restrictions (EC 1907/2006), IPC-1752 Level 3 materials declarations, and their subsequent amendments. Triune Systems maintains certified laboratory reports for all product materials, from all suppliers, which show full compliance to restrictions on the following:

- Cadmium (Cd)
- Chlorofluorocarbons (CFCs)
- Chlorinate Hydrocarbons (CHCs)
- Halons
- Hexavalent Chromium (CrVI)
- Hydrobromofluorocarbons (HBFCs)
- Hydrochlorofluorocarbons (HCFCs)
- Lead (Pb)
- Mercury (Hg)
- Perfluorocarbons (PFCs)
- Polybrominated biphenyls (PBB)
- Polybrominated Diphenyl Ethers (PBDEs)

Carrier Tape Specification

All DFN and QFN packages will be oriented so that the index package locations will be on the upper right corner of the sprocket side of the carrier tape.

All carrier tape used for packaging Triune Components will be specifically formulated to provide protection from physical and electro-static discharge (ESD) damage during shipping and storage. Embossed carrier tape must be EIA standard-481-1 compliant and meet the mechanical characteristics shown in Table 3.
