UC1602i

Single-Chip, Ultra-Low Power Passive Matrix LCD Controller-Driver

INTRODUCTION

UC1602i is an advanced high-voltage mixedsignal CMOS IC, especially designed for the display needs of ultra-low power hand-held devices.

In addition to low power column and row drivers, these ICs contain all necessary circuits for high-V LCD power supply, bias voltage generation, timing generation and graphics data memory.

Advanced circuit design techniques are employed to minimize external component counts and reduce connector size while achieving extremely low power consumption.

MAIN APPLICATIONS

- Cellular Phones or Smart Phones
- Pagers or other battery operated messaging devices
- Battery Powered Portable Instruments

FEATURE HIGHLIGHTS

- Supports I²C 2-wire serial interface and 8bit parallel bus interface.
- Ultra-low power LCD controller-driver with built-in display RAM and timing generator to support compact LCD module using as few as 5 pins.
- V_{DD2/3} voltage range: 2.4V ~ 3.3V
 V_{DD1} voltage range: 1.8V ~ 3.3V
 LCD V_{OP} range: 4.5V ~ 10.5V
- 6x, built-in self-configuring, charge pump allows the use of low V_{DD} while produce high V_{LCD} for driving LCD.
- On-chip charge pump pumping capacitors requires only 3 external capacitors.
- Two multiplexing rates: 1/65, 1/49.
- Four temperature compensations.
- Support both high speed parallel interfaces and compact serial interfaces.
- Flexible data addressing/mapping schemes to support wide ranges of software models and LCD layout placements.

General Notes

APPLICATION INFORMATION

For improved readability, the specification contains many application data points. When application information is given, it is advisory and does not form part of the specification for the device.

BARE DIE DISCLAIMER

All die are tested and are guaranteed to comply with all data sheet limits up to the point of wafer sawing for a period of ninety (90) days from the date of UltraChip's delivery. There is no post waffle saw/pack testing performed on individual die. Although the latest modern processes are utilized for wafer sawing and die pick-&-place into waffle pack carriers, UltraChip has no control of third party procedures in the handling, packing or assembly of the die. Accordingly, it is the responsibility of the customer to test and quality their application in which the die is to be used. UltraChip assumes no liability for device functionality or performance of the die or systems after handling, packing or assembly of the die.

LIFE SUPPORT APPLICATIONS

These devices are not designed for use in life support appliances, or systems where malfunction of these products can reasonably be expected to result in personal injuries. Customer using or selling these products for use in such applications do so at their own risk.

PIN DESCRIPTION

Name	Туре	Pins	Description
		_	MAIN POWER SUPPLY
			V_{DD1} supplies for display data RAM and digital logic, V_{DD2} supplies for $V_{\text{LCD}}/V_{\text{B}}$ generator, V_{DD3} supplies for V_{REF} and other analog circuits.
V _{DD1}	PWR		V_{DD2}/V_{DD3} should be connected to the same power source. But V_{DD1} can be connected to a source voltage no higher than V_{DD2}/V_{DD3} .
V _{DD3}			In COG applications, always use separate ITO traces for $V_{\text{DD1}},V_{\text{DD2}}$ and V_{DD3} to reduce noise coupling.
V _{SS} V _{SS2}	GND		Ground. In COG applications, use separate ITO traces to connect $V_{\rm SS}$ and $V_{\rm SS2}$ to the separate GND pins or to the shared GND pin and minimize both ITO resistance.
			LCD POWER SUPPLY
V _{B1+} V _{B1-} V _{B0-}	PWR		LCD Offset Voltages. Connect two C _B capacitors between V _{B+} to V _{B0+} and V _{B0-} to V _{B-} . For optimum operation result, minimize the ITO trace resistance of these nodes.
V _{B0+}			Place C_{B1} and C_{B0} on the FPC or COF to reduce I/O pin count by 4.
V _{LCD-IN} V _{LCD-OUT}	PWR		Main LCD Power Supply. When internal V _{LCD} is used, connect these pins together. When external V _{LCD} source is used, connect external V _{LCD} source to V _{LCD-IN} pins and leave V _{LCD-OUT} pins open.
			A by-pass capacitor C_L should be connected between V_{LCD} and V_{SS2} . Minimize the ITO trace resistance in COG applications.

			In I ² C mode, SDA and SCK are in open-drain mode. Pull up resistors are required on the bus. In COG applications, be careful to control ITO trace resistance, as it will affect effective output level of SDA.							

Νοτε

- Unless otherwise specified, connect all unused input pins and control pins to $V_{\text{SS}}.$

CONTROL REGISTERS

UC1602I contains registers which controls the chip operation. These registers can be modified by commands. The commands supported by UC1602I are described in the next section.

- *Name:* The Symbolic reference of the register byte. Note that, some symbol names refers to collection of bits (flags) within one register byte.
- Default: Value after Power-up-Reset and System-Reset. "PIN" means default value depends on the connection of associated configuration pin(s).

Name	Bits	Default	Description				
MR	1	1H	Multiplexing Rate: Number of pixel rows plus icon row.				
			0: 49 1: 65				
SL	6	0H	Start Line. Mapping from Row0 to Display Data RAM.				
CR	8	0H	Return Column Address.				
CA	8	0H	Display Data RAM Column Address (Used in Host to Display Data RAM access)				
PA	4	0H	Display Data RAM Page Address (Used in Host to Display Data RAM access)

Set LCD Bias Ratio	0	0	1	1	1	0	1	0	#	#	Set BR[1:0]= D[1:0]
Set/Reset Cursor-Update Mode	0	0	1	1	1	0	1	1	1	#	Set AC[3]=D0; if (D0) CR=CA else CA=CR;
Set Test Control (double byte command)	0 0	0 0	1 #	1 #	1 #	0 #	0 #	1 #	T #	T #	For testing only. Do not use.

* Other than commands listed above, all other bit patterns result in NOP (No Operation).

High-Voltage Mixed-Signal IC

LCD VOLTAGE SETTINGS

MULTIPLEX RATES

Two multiplex rates are supported in UC1602I: 65 or 49. The default is 65 and it can be changed by programming.

BIAS SELECTION

Bias Ratio (*BR*) is defined as the ratio between V_{LCD} and V_{D} , i.e. *BR* = V_{LCD}/V_D , where V_D is the SEG data signal and its value is $|V_{B1+} - V_{B1-}|$

The optimum Bias Ratio can be calculated by:

 $\sqrt{Mux} + 1$

UC1602I supports four bias ratios as below.

BR	0	1	2	3				
Bias Ratio	6	7	8	9				

 Table 2: BR vs. Mux rates

BR and MR can both be changed dynamically by software programming.

V_D GENERATION

 V_D is generated internally by UC106. The value of V_D is determined by three control registers: *GN* (Gain), *PM* (Potential Meter), TC (Temperature Compensation) with the following relationship:

$$V_D = Gain \times V_{PM}$$

where V_{PM} is the output of an internal Electronic Potential Meter. The maximum value for V_D depends on the value of V_{DD2} . At V_{DD2} = 2.4V, V_D should be kept under 1.2V.

The value of V_{PM} is given by:

$$V_{PM} = \frac{600 + PM}{1200} \times V_{REF}$$

The value of *Gain* is controlled by GN[1:0]. Their relationship is shown below:

GN[1:0]	00	01	10	11
Gain	1.35	1.49	1.64	1.81

 Table 3: Gain vs. GN value

V_{REF} **TEMPERATURE COMPENSATION**

 V_{REF} is a temperature compensated reference voltage. V_{REF} increases automatically as ambient temperature cools down.

Four (4) different temperature compensated V_{REF} can be selected via pin wiring. The compensation coefficient is given by the following table:

TC[1:0]	0	1	2	3		
% per °C	0.0	-0.05	-0.10	-0.20		

Table 4: Temperature Compensation

For all TC values, V_{REF} are normalized to 1.2V at 25 $^{\circ}\text{C}.$

VLCD SELECTION

 V_{LCD} may be supplied either by internal charge pump or by external power supply. The source of V_{LCD} is controlled by PC[2:1].

When V_{LCD} is generated internally its value has the following relationship with V_{D} :

$$V_{LCD} = BiasRatio \times V_D$$

Given V_{REF} = 1.2V at 25 °C, V_{LCD} becomes:

$$V_{LCD} \cong BiasRatio \times Gain \times \frac{600 + PM}{1200} \times 1.2$$
 (1)

When PM=0, then equation (1) becomes:

$$V_{LCD} \cong BiasRatio \times Gain \times 0.6$$
 (1b)

LOAD DRIVING STRENGTH

UC106's drivers and power supply circuits are designed to handle panel capacitance load of 25nF at V_{LCD}=9V when V_{DD2} >= 2.4V.

UC1602I load driving strength is sensitive to ITO impedance of power supply circuits (V_{DD2} , V_{SS2} , $V_{B0/B1}$, V_{LCD} .) Be sure to minimize the resistance of these ITO traces for COG applications.

POWER SUPPLY CONFIGURATION

UC1602I has built-in charge pump with on-chip pumping capacitors. The number of pump stages used can be programmed by setting PC[2:1] register. Make sure the chip is in Reset mode before changing the value of PC[2:0].

Given the same display quality, the lower the PC[2:1] setting the more efficient is UC1602I, but the weaker is the driving strength. In application, designer is recommended to verify the design with the highest setting first before trying lower settings to achieve better efficiency.

Due to the use of fully embedded power supply, built-in power ready detector, and drain circuit, there is no rigid power up or power down sequences for UC1602I controllers when using internal V_{LCD} generator.

On the other hand, caution must be exercised when external V_{LCD} source is used. The general rule of thumb is to make sure Display Enable is

OFF before connecting or disconnecting external V_{LCD} sources.

LCD DISPLAY CONTROLS

CLOCK & TIMING GENERATOR

The nominal frequency of UC1602I built-in system clock is 166kHz, the LCD refresh frequency is 80Hz. All required components for the clock oscillator are built-in. No external parts are required.

DRIVER MODES

Row and column drivers can be in either Idle mode or Active mode, controlled by Display Enable flag (DC[2]). When column drivers are in idle mode, their outputs are high-impedance (open circuit). When row drivers are in idle mode, their outputs are connected to $V_{\rm SS}$.

DRIVER ARRANGEMENTS

The naming conventions are: Rx (where x=1~64) refers to the row driver for the x-th row of pixels on the LCD panel; RIC refers to the icon driver.

Row drivers are clustered into "even row drivers" and "odd row drivers", along the two sides of the chip to enhance the symmetry of ITO layout.

The mapping of Rx to LCD pixel rows is the same for all MR settings. When MR setting is not 11, leave unused row drivers open.

DISPLAY CONTROLS

There are three display control flags in the control register DC: Display Enable (DE), All-Pixel-ON (APO) and Inverse (PXV). DE has the overriding effect over PXV and APO.

65x102 Matrix LCD Controller-Drivers

DISPLAY ENABLE (DE)

Display Enable is controlled by the Set Display ON command. When DE is set to OFF (logic "0"), both column and row drivers will become idle and the chip will put itself into Sleep Mode to conserve power.

When the DE is set to ON, the chip will first exit from Sleep mode by restoring the power (V_{LCD} , V_D etc.). When the power is restored, column and row drivers will become active.

ALL PIXELS ON (APO)

When set, this flag will force all column drivers to output On signals, disregarding the data stored in the display buffer.

This flag has no effect when Display Enable is OFF and it has no effect on data stored in RAM.

INVERSE (PXV)

When this flag set to ON, column drivers will output the inverse of the value it received from the display buffer RAM. This flag has no impact on data stored in RAM.

HOST INTERFACE

UC1602I series supports several parallel and serial host interface formats.

Bus	Bus Type	Access
Darallol	8080	R/W
Falaliel	6800	R/W
Sorial	4-wire (S8)	W
Senai	2-wire (I ² C)	R/W

Table 5: Host interfaces Choices

System designers can use either the 8-bit parallel bus to achieve the high data transfer rate, or use serial bus to create LCD modules with as few as 9-pin connectors.

PARALLEL INTERFACE

It is possible to interface UC1602I controllers directly to either an 8080-style MPU bus or a 6800-style MCU bus with the following connection.

Bus Type	WR0	WR1
8080	WR	RD
6800	R/W	E

Table 6: MPU bus control signal interface

The timing relationship between UC1602I internal control signal RD, WR and their associated bus actions are shown in the figure below. The generation of UC1602I internal bus control signals WR and RD is shown in the table below.

Bus Type	WR	RD
8080	WR0	WR1
6800	!(WR1 & !WR0)	!(WR1 & WR0)

Table 7: WR and RD signal generation

DISPLAY RAM DATA TRANSFER

UC1602I Display Data RAM (RAM) read interface is implemented as a two-stage pipe-line. This architecture requires that, every time memory address is modified, either in parallel mode or serial mode, all three commands (*Set CA-LSB, Set CA-MSB, Set PA*) need to be issued, and a dummy read cycle need to be performed before the actual data can propagate through the pipeline and be read from data port D[7:0].

There is no pipeline in write interface of RAM, and the data is transferred directly from data bus buffer to RAM.

Figure 5: Parallel Interface & Related Internal Signals

High-Voltage Mixed-Signal IC

SERIAL INTERFACE

UC1602I supports two serial modes, 4-wire mode (PS=0), and 2-wire l^2 C mode (PS=1). The mode of interface is determined during power-up process by the value of PS[1:0].

4-WIER SERIAL INTERFACE (S8)

Only write operations are supported in 4-wire serial mode. Pin CS[1-0] are used for chip select and bus cycle reset. Pin CD is used to determine

the content of the data been transferred. On each write cycle, 8 bits of data, MSB first, are latched on eight (8) rising SCK edges into an 8-bit data holder. If CD=0, the data byte will be decoded as command. If CD=1, this 8-bit will be treated as data and transferred to proper address in the Display Data RAM at the rising edge of the last SCK pulse.

Pin CD is examined when SCK is pulled low for the LSB (D0) of each token.

Figure 6: 4-wire Serial Interface (S8)

2-WIRE SERIAL INTERFACE (I²C)

When PS[1-0] is set to "LH", UC1602I is configured as a slave receiver/transmitter, for industry standard I^2C serial interface.

Each UC1602I I^2 C interface sequence starts with a START condition (S) from the bus master, followed by a sequence header, containing a device address, the direction of transfer (RW, 0:Write, 1:Read) and mode of transfer (CD, 0:Control, 1:Data).

In this mode, CS[1:0] become A[1:0] and are used to configure UC1602I's device address. WR[1:0] and CD are not used and may be connected to GND.

The direction and content of the bytes following each header byte are fixed for the sequence. To change the direction ($R \Leftrightarrow W$) or the content type ($C \Leftrightarrow D$), start a new interface sequence with a new header.

After receiving the header, the UC1602I will send out an acknowledge signal (A). Then, depends on the setting of the header, the transmitting device (either the bus master or UC1602I) will start placing data bits on the serial bus, MSB to LSB, and the sequence will repeat until a STOP signal (P, in WRITE), or a Not Acknowledge (N, in READ mode) is sent by the bus master.

Note that, for data read (CD=1), the first byte of data is dummy.

65x102 Matrix LCD Controller-Drivers

2-WIRE INTERFACE TIMING

The 2-wire I^2C interface is a bidirectional interface. In order to properly communicate between all I^2C devices, certain timing protocols need to be satisfied.

There are always master and slave devices on an I^2C bus. The master device initiates an read or write action to the slave device with an address. The selected slave device to the action transimitting or receiving data. Without any action, the I^2C bus are pulled high by two pull-up resistors. A master or slave device initiates or responds to an action by pulling down the bus. UC1602I is a slave I^2C device.

In idle mode, the both wires, SDA and SCK are pulled high. When the SDA makes a HIGH to LOW transition while SCK remains high, this is the I^2C START condition. When the SDA makes a LOW to HIGH transition while SCK remain low, this is I^2C STOP condition. In between a START and STOP condition, I^2C transmits data bits by toggling SCK while SDA remains stable. These relations are shown in **Figure 8**.

Figure 8. I²C bus SDA and SCK timing relation.

Each eight-bit of data is followed by an acknowledge pulse from the receiver as shown in **Figure 9**. The master device will generate an extra pulse during this time. It is the receiving device's responsibility to generate this acknowledge pulse regardless of being a master or slave device. UC1602I generates an

acknowledge pulse in the write mode. When the acknowledge pulse is HIGH, UC1602I has received write instruction or data correctly. When the acknowledge pulse is LOW, UC1602I has not correctly received instruction and the master device needs to resend.

High-Voltage Mixed-Signal IC

SERIAL INTERFACE EXAMPLES

The table below shows an example of UC1602I to support a 9-pin (or 4-pin, if C_{LCD} and C_{Bx} are mounted on FPC or COF) interface using I²C.

Hard wired	Comment
RST="H"	Use software Reset exclusively.
CA[1:0] ="XX"	Chip address
SP="01"	UC1602I will power up and reset to I ² C interface mode
on FPC/COF	Comment
V _{B0+} , V _{B0-} V _{B1+} , V _{B1-}	Connect to proper capacitors. These capacitors can be mounted on FPC as SMD.
Interface	Comment
SCK	Connect to clock
SDA	Serial I/O
V _{DD1} , V _{DD2} , V _{DD3}	Use three separate ITO traces to one common node.
V _{SS1} ,V _{SS2}	Use two separate ITO to one common node.
V _{LCD}	To V _{LCD} bypass capacitor

Table 9: I²C Interface Example

The table below shows an example of UC1602I to support a 11-pin (or 6-pin, if C_{LCD} and C_{Bx} are mounted on FPC or COF), using S8, Write-only interface mode and CD pin for bus control.

Hard wired	Comment
RST="H"	Use software Reset exclusively.
SP="00"	UC1602I will power up and reset to S8 interface mode
SDO	Not used, Connect to GND
On FPC/COF	Comment
V _{B0+} , V _{B0-} V _{B1+} , V _{B1-}	Connect to two capacitors, mounted on FPC as SMD.
Interface	Comment
CS0 (or CS1)	Chip select
CD	Control or Display.
0.01/	
SCK	Connect to clock
SCK SDA	Connect to clock Serial Data IN
SCK SDA V _{DD1} , V _{DD2} , V _{DD3}	Connect to clock Serial Data IN Use three separate ITO traces to one common node.
SCK SDA V _{DD1} , V _{DD2} , V _{DD3} V _{SS1} , V _{SS2}	Connect to clock Serial Data IN Use three separate ITO traces to one common node. Use two separate ITO to one common node.

Table 10: S8 Interface Example

DISPLAY DATA RAM

DATA ORGANIZATION

The display data is one bit per pixel and stored in a dual port static RAM (RAM, for Display Data RAM). The RAM size is 65x102. This array of data bits are further organized into pages of 8 bit slices to facilitate parallel bus interface.

At the end of the graphics data, UC1602I contains an 1-bit wide page for icon data.

When Mirror X (MX, LC[2]) is OFF, the 1st column of LCD pixels will correspond to the bits of the first byte of each page, the 2nd column of LCD pixels correspond to the bits of the second byte of each page, etc.

MSB FIRST OR LSB FIRST

There are two options to map D[7:0] to RAM, MSB first (MSF=1), or LSB first (MSF=0), as illustrated below.

DISPLAY DATA RAM ACCESS

The memory used in UC1602I Display Data RAM (RAM) is a special purpose two port SRAM which allows asynchronous access to both its column and row data. Thus, RAM can be independently

accessed both for Host Interface and for display operations.

DISPLAY DATA RAM ADDRESSING

A Host Interface (HI) memory access operation starts with specifying Page Address (PA) and Column Address (CA) by issuing *Set Page Address* and *Set Column Address* commands.

If wrap-around (WA, AC[0]) is OFF (0), CA will stop incrementing after reaching the end of page (102), and system programmers need to set the values of PA and CA explicitly.

If WA is ON (1), after CA has reached the end of page (CA=101), CA will be rest to 0 and PA will increment or decrement, depending on the setting of Page Increment Direction (PID, AC[2]). When PA reaches the boundary of RAM (i.e. PA = 0 or 7), PA will be wrapped around to the other end of RAM and continue.

ICON DATA ADDRESSING

The Icon Page is addressed by explicitly setting PA to 8 (the 9th page). When addressing Icon page, auto wrap-around will be suspended and CA will stop when CA reaches 102.

65x102 Matrix LCD Controller-Drivers

MX IMPLEMENTATION

Column Mirroring (MX) is implemented by selecting either (CA) or (101–CA) as the RAM column address. Changing MX affects the data written to the RAM.

Since MX has no effect of the data already stored in RAM, changing MX does not have immediate effect on the displayed pattern. To refresh the display, refresh the data stored in RAM after setting MX.

DISPLAY SCANNING

During each field of display, depends on the setting of MR, row electrodes will be scanned in a fixed pattern at a rate of

(80 x Mux Rate) rows/second.

During each row period, the signal at the column drivers determine the ON/OFF status of the row of pixels being scanned.

Row Scanning

Icon data is always outputted via RIC electrodes before the 1^{st} row of each field. It is then followed by scanning R1 through R*m*, where *m* may be 64, or 48 depends on the setting of MR.

Row electrode scanning orders are not affected by Start Line (SL) or Mirror Y (MY, LC[3]). When MY is 0, the effect of SL having a value *K* is to change the mapping of R0 to the *K*-th bit slice of data stored in display RAM. Visually, SL having a non-zero value is equivalent to scrolling LCD display up by SL rows.

RAM ADDRESS GENERATION

The mapping of the data store in the display SRAM and the scanning electrodes can be obtained by combining the fixed R*m* scanning

sequence and the following RAM address generation formula.

During the display operation, the RAM line address generation can be mathematically represented as following:

> For the 1st line period of each field Line = Icon Line (40H)

> For the 2^{nd} line period of each field Line = SL

Otherwise

Line = Mod(Line+1, 64)

Where Mod is the modular operator, and *Line* is the bit slice line address of RAM to be outputted to column drivers. Line 0 corresponds to the first bit-slice of data in RAM.

The above *Line* generation formula produce the "loop around" effect as it effectively resets *Line* to 0 when *Line*+1 reaches 64.

Effects such as page scrolling, page swapping can be emulated by changing SL dynamically.

MY IMPLEMENTATION

Row Mirroring (MY) is implemented by reversing the mapping order between row electrodes and RAM, i.e. the mathematical address generation formula becomes:

For the 1st line period of each field *Line = Icon Line (40H)*

For the 2^{nd} line period of each field Line = Mod(SL + MUX-2, 64) where MUX = 65 or 49

Otherwise

Line = Mod(Line-1, 64)

Visually, the effect of MY is equivalent to flipping the display upside down. The data stored in display RAM is not affected by MY. High-Voltage Mixed-Signal IC

RESET & POWER MANAGEMENT

TYPES OF RESET

UC1602I has two different types of Reset: *Power-ON-Reset* and *System-Reset*.

Power-ON-Reset is performed right after V_{DD1} is connected to power. Power-On-Reset will first wait for about 12mS, depending on the time required for V_{DD} to stabilize, and then trigger the System Reset.

System Reset can also be activated by software command or by connecting RST pin to ground.

In the following discussions, Reset means *System Reset.*

RESET STATUS

When UC1602I enters RESET sequence:

- All non-pin configurable control registers will be reset to their default values.
- All pin configurable control registers will be reset according to their configuration pins.
- Operation mode will be "Reset"
- System Status bits RS and BZ will stay as "1" until the Reset process is completed (for a duration of 3~5uS).

Refer to Control Registers for details of control flags and their default values. Refer to Pin Description for configuration pin definitions.

When RS=1, only status read command is processed by UC106. All other commands are ignored.

Once entered Reset mode, all control registers will be reset to their default values and capacitors will be discharged. In general it is necessary to set up control registers before transition out of the Reset mode.

OPERATION MODES

UC1602I has three operating modes (OM): Reset, Normal, Sleep.

Mode	Reset	Sleep	Normal
OM	00	10	11
Host Interface	Active	Active	Active
Clock	OFF	OFF	ON
LCD Drivers	OFF	OFF	ON
Charge Pump	OFF	OFF	ON
Draining Circuit	ON	OFF	OFF

Table	11:	Operating	Modes
-------	-----	-----------	-------

CHANGING OPERATION MODE

Two commands will initiate OM transitions: Set Display Enable, and System Reset.

Action	Mode	ОМ
Set Display Enable "ON"	Normal	11
Set Display Enable "OFF"	Sleep	10
Reset command RST_ pin pulled "L" Power ON reset	Reset	00

Table 12: OM changes

When DC[2] is modified by *Set Display Enable*, OM will be updated automatically. There is no other action required to enter power saving mode.

For maximum energy utilization, Sleep mode is designed to retain charges stored in external capacitors C_{B0} , C_{B1} and C_{LCD} . To drain these capacitors, use Reset command to activate the on-chip draining circuit.

OM changes are synchronized with the edges of UC1602I internal clock. To ensure consistent system states, wait at least 10uS after *System Reset* or *Set Display Enable* command.

EXITING POWER SAVE MODES

UC1602I contains internal logic to check whether V_{LCD} and V_D is ready before releasing row and column drivers from their OFF states. When exiting Sleep Mode and Reset Mode, column and row drivers will not be activated until UC1602I internal voltage sources are restored to their proper values.

POWER-UP SEQUENCE

UC1602I power-up sequence is simplified by built-in "Power Ready" flags and by the automatic invocation of *System-Reset* command after *Power-ON-Reset*. System programmer are only required to wait 4~6 ms before starting to issue commands to UC106. No additional commands or waits are required between enabling of the charge pump, turning on the display drivers, writing to RAM or any other commands.

POWER-DOWN SEQUENCE

To prevent the charge stored in capacitors C_{B+} , C_{B-} , and C_{LCD} from damaging the LCD when V_{DD} is switched off, use Reset mode to enable the built-in charge draining circuit to discharge these external capacitors.

UC1602I draining resistance is 1K for both V_{LCD} and $V_{\text{B+}}.$ It is recommended to wait 3 x RC for

65x102 Matrix LCD Controller-Drivers

 V_{LCD} and 1.5 x RC for V_{B^+} before allowing V_{DD} to drop below 2V. For example, if C_{LCD} is 1uF, then the draining time required for V_{LCD} is 3~5mS.

UC1602I will *not* drain V_{LCD} when internal V_{LCD} is not used. System designer should take care to

Figure 12: Reference Power-up Sequence

make sure external V_{LCD} source is properly drained off before turning off VDD.

Figure 13: Reference Power-Down Sequence

High-Voltage Mixed-Signal IC

SAMPLE COMMAND SEQUENCES

The following table are host interface examples for various UC1602I operations.

Step sequences starting with the same number (such as 2a, 2b, 2c, ...) can be rearranged without affecting the result. Some optional steps have mutual dependencies. Such mutually-dependent optional steps need to be elected or skipped together as a group.

- C/D The type of the interface cycle. Depending on the interface type (parallel or serial). This may be external pin (parallel and serial 8-bit), part of the bit stream (serial 9-bit write) or the internal flag (serial 9-bit read).
- W/R The direction of data flow of the cycle. It can be either Write (0) or Read (1).
- BZ, OM The status of these flags "during" the operation of the command.
- (Opt.) Optional item.

POWER-UP SEQUENCE

The only "*required*" command to initialize UC1602I is *Set Display ON*. However, many other commands (such as *Set APO* = 0/1, *Set LCD Mapping*) and any of the NOP bit patterns can be used for maximum software compatibility with other industry leading LCD controller-drivers.

The following command sequence can be performed in parallel 8-bit, I²C or S8 modes.

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation		ΒZ	Comments

High-Voltage Mixed-Signal IC

PREPARE TO ACCESS DATA RAM

Address control (register AC) flags and some LCD to SRAM mapping (register LC) flags affect how data is stored into the display buffer SRAM => Make proper adjustment to these two registers before writing data to UC1602I display buffer SRAM.

These sequence can be performed in parallel 8-bit, I^2C or S8 modes. These commands can be performed under any operating mode (OM).

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation	OM	ΒZ	Comments
	0	0	1	0	0	0	1	#	#	#	(Opt.) Set Address Control	I	0	
	0	0	1	1	0	0	#	#	0	#	(Opt.) Set/clear LCD Mapping control flags.	1	0	

DATA RAM ACCESS: WRITE

These sequence can be performed in parallel 8-bit, I^2C or S8. These commands can be performed under any operating mode (OM).

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation	OM	ΒZ	Comments
1	0	0	1	0	1	1	#	#	#	#	Set Page Address	-	0	
2	0	0	0	0	0	1	#	#	#	#	Set Column Address MSB	-	0	
3	0	0	0	0	0	0	#	#	#	#	Set Column Address LSB	-	0	
4	1	0	#	#	#	#	#	#	#	#	Write Display Data (repeat as appropriate)	I	0	
5											(Return to 1 as necessary, repeat until complete)	-	0	

DATA RAM ACCESS: READ

For parallel interface and I²C modes, a dummy Read cycle is required when a Read Data command follows immediately after a Write cycle (either Write Data or Write Control).

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation	OM	ΒZ	Comments
1	Х	0	1	0	1	1	#	#	#	#	Write cycle (either data or control)	1	0	For example: Commands setting PA and/or CA.
2	1	1	-	-	-	-	-	-	-	-	Dummy Read cycle	-	0	
3	1	1	#	#	#	#	#	#	#	#	Read Display Data (repeat as appropriate)	-	0	

DATA RAM ACCESS: CURSOR UPDATE

Cursor can be used to support many flexible user interface designs. Blinking cursor requires frequent update to a limited set of pixels. UC1602I Cursor update mode is designed to facilitate such frequent data RAM updates.

Under Cursor Update mode, both the wrap around (CA reset to 0, PA increment or decrement) and CA increment on Read are temporary disabled. These two features allow system designer to minimize the need to update CA and PA registers and allows on-chip RAM to be used in Read-Modify-Write style operations.

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation	OM	ΒZ	Comments
1	0	0	1	1	1	0	0	0	0	0	Set Cursor-Update mode and set CR=CA		0	CR tracks where CA should be restored later
2	1	1	-	-	-	Ι	Ι	Ι	Ι	1	Dummy Read cycle	-	0	CA unchanged
	1	1	#	#	#	#	#	#	#	#	Read Display Data

											Return to 1 for next cursor update cycle or continue	-	0	

EXAMPLE 1: CURSOR UPDATE WITH READ-MODIFY-WRITE, PARALLEL INTERFACE OR I²C MODE

EXAMPLE 2: CURSOR UPDATE WITHOUT READ, ALL INTERFACE MODES

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation	OM	ΒZ	Comments
1	0	0	1	1	1	0	1	1	1	1	Set Cursor-Update mode and set CR=CA	-	0	CR remembers where CA should be restored later
2	1	0	#	#	#	#	#	#	#	#	Write Display Data	-	0	CA will increment
3											(Return to 2 and repeat until the cursor is updated)	-	0	but will not wrap around
4	0	0	1	1	1	0	1	1	1	0	Clear Cursor Update Mode	-	0	Set CA=CR
											Return to 1 for next cursor update cycle or continue	-	0	

ENABLE DISPLAY

The following command sequence can be performed in all interface modes.

#	C/D	W/R	D7	D6	D5	D4	D3	D2	D1	D0	Operation	OM	ΒZ	Comments
	0	0	0	1	#	#	#	#	#	#	(Opt.) Set Start Line	-	0	
	0	0	1	0	1	0	0	1	0	#	(Opt.) Set All-Pixel-ON	-	0	
	0	0	1	0	1	0	0	1	1	#	(Opt.) Set Inverse Mode.	-	0	
	0	0	1	0	1	0	1	1	1	1	Set Display ON	11	0	

Note:

The order of these steps are not critical. However, for the smoothness of display effect, the above sequence is recommended.
