HIGH PERFORMANCE CURRENT MODE PWM CONTROLLERS

DESCRIPTION

The UTC **UC2844/2845** are high performance fixed frequency current mode controllers that specifically designed for Off-Line and DC to DC converter applications with minimal external parts count.

The differences between **UC2844** and **UC2845** are the maximum duty cycle ranges and under-voltage lockout thresholds. The **UC2844** ideally suited to off-line applications with UVLO thresholds of $16V_{(ON)}$ and $10V_{(OFF)}$, and **UC2845** has UVLO thresholds of $8.5V_{(ON)}$ and $7.6V_{(OFF)}$ for lower voltage applications.

■ PIN CONFIGURATION

■ PIN DESCRIPTION

PIN NO	PIN NAME	FUNCTION
1	Compensation	Error amplifier output, this pin is made available for loop compensation.
2	V_{FB}	Voltage Feedback, the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	I_{SENSE}	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	R_T/C_T	The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor R_T to V_{REF} and capacitor C_T to ground. Operation to 1 MHz is possible.
5	GND	Power ground.
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. The output switches at one-half the oscillator frequency.
7	V_{CC}	Positive supply.
8	V_{REF}	Reference output, provides charging current for capacitor C_T through resistor R_T .
