

■ **Features:**

- Vcc operation voltage : 1.5V ~ 3.6V
- Low power consumption :
35mA (Max.) operating current
2uA (Typ.) CMOS standby current
- High Speed Access time :
70ns (Max.) at Vcc = 1.5V
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Data retention supply voltage as low as 1.2V
- Easy expansion with CE\ and OE\ options

■ **Description**

The UC62LV2008 is a high performance, very low power CMOS Static Random Access Memory organized as 524,288 words by 8 bits and operates from 1.5V to 3.6V supply voltage. Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 2uA and maximum access time of 70ns in 1.5V operation.

Easy memory expansion is provided enable (CE\), and active LOW output enable (OE\) and three-state output drivers.

The UC62LV4008 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.

The UC62LV4008 is available in the JEDEC standard 32 pin 450mil Plastic SOP, 8mmx20.0mm TSOP (type I), and 8mmx13.4mm STSOP.

■ PIN DESCRIPTION

Name	Type	Function
A0 – A18	Input	Address inputs for selecting one of the 524,288 x 8 bit words in the RAM
CE\	Input	CE\ is active LOW. Chip enable must be active when data read from or write to the device. If chip enable is not active, the device is deselected and not in a standby power down mode. The DQ pins will be in high impedance state when the device is deselected.
WE\	Input	The Write enable input is active LOW and controls read and write operations. With the chip selected, when WE\ is HIGH and OE\ is LOW, output data will be present on the DQ pins, when WE\ is LOW, the data present on the DQ pins will be written into the selected memory location.
OE\	Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when OE\ is inactive.
DQ0 – DQ7	I/O	These 8 bi-directional ports are used to read data from or write data into the RAM.
Vcc	Power	Power Supply
Gnd	Power	Ground

NOTES:

1. WE is high in read cycle.
2. Device is continuously selected when $CE = VIL$.
3. Address valid prior to or coincident with CE transition low.
4. $OE = VIL$.
5. Transition is measured $\pm 500mV$ from steady state with $CL=5pF$ as shown in Figure 1B. The parameter is guaranteed but not 100% tested.

■ **SWITCHING WAVEFORMS (WRITE CYCLE)**

WRITECYCLE1⁽¹⁾

WRITE CYCLE2^(1,6)

NOTES:

1. WE\ must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of CE\ and WE\ low. All signals must be active to initiate a write and any one can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. T_{WR} is measured from the earlier of CE\ or WE\ going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the CE\ low transition occurs simultaneously with the WE\ low transitions or after the WE\ transition, output remain in a high impedance state.
6. OE\ is continuously low ($OE\ = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If CE\ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured 500mV from steady state with $C_L = 5pF$ as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. TCW is measured from the later of CE\ going low to the end of write.
