

### 1.2MHZ, 2.5A SYNCHRONOUS STEP-DOWN CONVERTER

#### DESCRIPTION

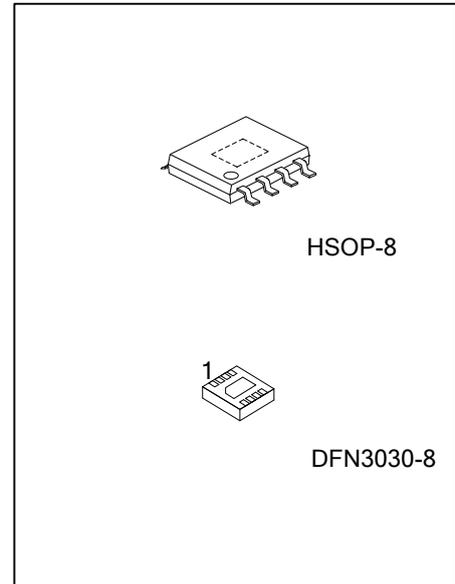

The **UTC UD05251** is a 1.2MHz constant frequency current mode PWM step-down converter. It is ideal for portable equipment requiring very high current up to 2.5A from single-cell Lithium-ion batteries while still achieving over 90% efficiency during peak load conditions.

The **UTC UD05251** also can run at 100% duty cycle for low dropout operation, extending battery life in portable systems while light load operation provides very low output ripple for noise sensitive applications.

The **UTC UD05251** can supply up to 2.5A output current from a 2.6V to 4V input voltage and up to 3A output current from a 4V to 5.5V input voltage. These devices are available in fixed output voltages from 0.6V to  $V_{IN}$  in increments of 0.05V and an adjustable output version. The high switching frequency minimizes the size of external components while keeping switching losses low. The internal slope compensation setting allows the device to operate with smaller inductor values to optimize size and provide efficient operation.

#### FEATURES

- \* 2.6V to 5.5V Input Voltage Range
- \* Adjustable Output Voltages from 0.6V to  $V_{IN}$   
Fixed output voltage from 0.6V to  $V_{IN}$  in increments of 0.05V
- \* High Efficiency: Up to 94%
- \* 1.2MHz Constant Frequency Operation
- \* Output Current: Up to 2.5A Output Current
- \* No Schottky Diode Required
- \* Current Mode Operation for Excellent Line and Load Transient Response
- \* Current limit, Enable function
- \* Short Circuit Protect (SCP)
- \* Build-in Soft Start function
- \*  $\leq 1\mu A$  Shutdown Current

## ■ FUNCTION DESCRIPTIONS

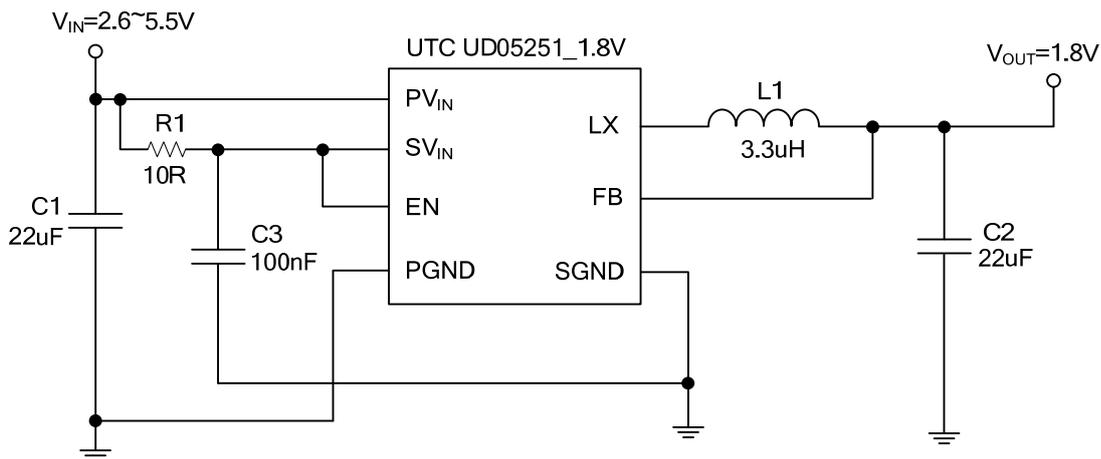

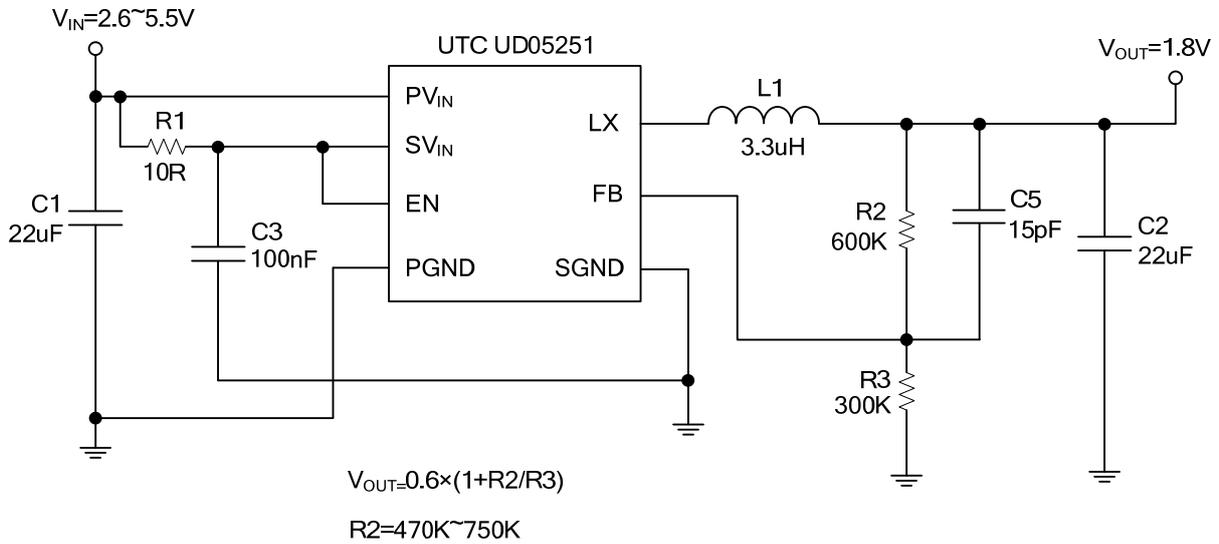

**Operation**

**UTC UD05251** is a monolithic switching mode Step-Down DC-DC converter. It utilizes internal MOSFETs to achieve high efficiency and can generate very low output voltage by using internal reference at 0.6V. It operates at a fixed switching frequency, and uses the slope compensated current mode architecture. This Step-Down DC-DC Converter supplies 2500mA output current at input voltage range from 2.6V to 5.5V.

**Current Mode PWM Control**

Slope compensated current mode PWM control provides stable switching and cycle-by-cycle current limit for excellent load and line responses and protection of the internal main switch (P-CH MOSFET) and synchronous rectifier (N-CH MOSFET). During normal operation, the internal P-CH MOSFET is turned on for a certain time to ramp the inductor current at each rising edge of the internal oscillator, and switched off when the peak inductor current is above the error voltage. The current comparator,  $I_{COMP}$ , limits the peak inductor current. When the main switch is off, the synchronous rectifier will be turned on immediately and stay on until either the inductor current starts to reverse, as indicated by the current reversal comparator,  $I_{ZERO}$ , or the beginning of the next clock cycle.
