

0.6A, 36V, 2MHZ STEP-DOWN CONVERTER

DESCRIPTION

The UTC **UD36061** is a high frequency (2MHz) step-down switching regulator with integrated internal high-side high voltage power MOSFET. It regulates input voltages from 3.3V to 36V down to an output voltage as low as 0.8V, and supplies 0.6A highly efficient output with current mode control for fast loop response.

In shutdown mode the supply current drops to 3 μ A, it allows use in battery-powered applications.

High power conversion efficiency over a wide load range is achieved by scaling down the switching frequency at light load condition to reduce the switching and gate driving losses.

The converter uses internal N-Channel MOSFET switches to step-down the input voltage to the regulated output voltage. Since the high side MOSFET requires a gate voltage greater than the input voltage, a boost capacitor connected between SW and BST is needed to drive the high side gate. The boost capacitor is charged from the internal 5V rail when SW is low.

Frequency fold-back helps prevent inductor current runaway during start-up. Thermal shutdown provides reliable, fault-tolerant operation.

■ PIN CONFIGURATION

■ PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	BST	High-Side Gate Drive Boost Input. BST supplies the drive for the high-side N-Channel MOSFET switch. Connect a 0.1 μ F or greater capacitor from SW to BST to power the high side switch.
2	GND	Ground.
3	FB	Feedback Input. FB senses the output voltage to regulate that voltage. Drive FB with a resistive voltage divider from the output voltage. The feedback threshold is 0.8V.
4	EN	Enable Input. Pulling this pin below the specified threshold shuts the chip down. Pulling it above the specified threshold enables the chip. Floating this pin shuts the chip down.
5	V _{IN}	Power Input. IN supplies the power to the IC, as well as the step-down converter switches. Drive IN with a 3.3V to 36V power source. Bypass IN to GND with a suitably large capacitor to eliminate noise on the input to the IC.
6	SW	Power Switching Output. SW is the switching node that supplies power to the output. Connect the output LC filter from SW to the output load. A low V _F Schottky diode to ground is required closed to this pin to reduce switching spikes.
