## FEATURES

- Single chip solution to all the data handling and supervisory functions

- Configuration to both AMPS and TACS

- Additional JTACS option

- $I^2C$-bus serial control

- All analog interface and filtering functions fully implemented on chip

- Error handling in hardware reduces software requirements

- Robust SAT decoding and transponding circuitry

- Low current consumption by on-chip power-down modes

- Reduced system current consumption by new integrated power-saving features

  - Majority voting includes more intelligence

  - On-chip control filler word filter

  - BCH error filter

  - Possibility to program ESCC bits

- Small physical size: SO28 or LQFP32

- External peripheral component count reduced

  - On-chip selectable clock divider

  - Integrated pull-up resistor at TXLINE

- Simplified reset and abort software routines possible

- The SO28 version is fully compatible with UMA1000LT and UMF1000T.

## GENERAL DESCRIPTION

The UMA1002 is a low power CMOS LSI device incorporating the data transceiving, data processing, and SAT functions (including on-chip filtering) for an AMPS or TACS hand-held portable cellular radio telephone.

In this data sheet, the UMA1002 is often referred to by the descriptive term 'DPROC2'.

## QUICK REFERENCE DATA

| SYMBOL | PARAMETER | MIN. | TYP. | MAX. | UNIT |
|--------|-----------|------|------|------|------|
| $V_{DD}$ | supply voltage | 2.7 | 3.0 | 5.5 | V |
| $I_{DD}$ | supply current normal operation with external clock | – | 1.3 | 1.8 | mA |
| $T_{amb}$ | operating ambient temperature | −30 | – | +70 | °C |

## ORDERING INFORMATION

| TYPE NUMBER | PACKAGE | | |
|-------------|---------|---|---|
| | NAME | DESCRIPTION | VERSION |
| UMA1002T | SO28 | plastic small outline package; 28 leads; body width 7.5 mm | SOT136-1 |
| UMA1002H | LQFP32 | plastic low profile quad flat package; 32 leads; body $7 \times 7 \times 1.4$ mm | SOT358-1 |

UMA1002

**PINNING**

| SYMBOL | PIN | | DESCRIPTION |
|--------|-----|-----|-------------|
| | **SO28** | **LQFP32** | |
| $V_{SSA}$ | 1 | 29 | Negative analog supply (0 V). To be connected low-ohmic to $V_{SSD}$. |
| AGND | 2 | 30 | Internally generated analog signal ground. Voltage level = $\frac{1}{2}V_{DDA}$. This pin should be connected to a blocking capacitor, no DC load allowed. |
| DEMODD | 3 | 31 | DEMODD inputs analog data and SAT signals from the RF demodulator. This pin should normally be AC-coupled. See Chapter "AC characteristics". |
| DATA | 4 | 32 | Data is an analog output which provides the Manchester encoded and filtered data signal, SAT and signalling tone. This signal should normally be AC-coupled into the Audio/Data summer. See Chapter "AC characteristics". |
| RACTRL | 5 | 1 | Received audio control output. Open-drain output used to blank the audio path to the earpiece when a sequence of dotting followed by a synchronization word or 2 synchronization words separated by 77 bits is detected. RACTRL and TACTRL functions can be combined using one line. Output level LOW means audio muted. |
| RESET | 6 | 2 | Master reset input resetting all internal flip-flops to the specified state. This input has no influence on analog parts, but must be controlled by an active HIGH microcontroller port. |
| INVRX | 7 | 4 | This input inverts the sense of received data stream, which allows RF demodulators with high or low local oscillators to be used. The AMPS and TACS specifications define NRZ encoded logic 1 as a LOW-to-HIGH transition in the centre of a data bit period. The polarity of the demodulated data stream into DPROC2 depends on the receiver local oscillator. Input LOW means data normal. |
| RXLINE | 8 | 5 | Received data signal output to the system controller. |
| TST | 9 | 7 | Test input pin (note 1). |
| RECDATA | 10 | 8 | Output of the recovered digital data signal (note 1). |
| TACTRL | 11 | 9 | Transmitter audio control output. This open-drain output is used to blank the audio path and enable the data path to the modulator during data bursts on the RVC. Output level LOW means audio muted. |
| CLKIN | 12 | 10 | 1.2 MHz or 9.6 MHz external master clock input. This input signal should be accurate to $100 \times 10^{-6}$ and have a worst case 60 : 40 mark-space ratio. |
| CLKOUT | 13 | 11 | Output of 1.2 MHz clock signal (for APROC) derived from CLKIN. |
| $V_{SSD}$ | 14 | 12 | Negative digital supply (0 V), internally connected to substrate. To be connected low-ohmic to $V_{SSA}$. |
| TXLINE | 15 | 13 | Open-drain bidirectional data line to the system controller (internal 100 kΩ pull-up). |
| n.c. | 16 | 14 | Not connected. |
| TXHOLD | 17 | 15 | This input holds off transmission of data when set to HIGH. |
| TXCLK | 18 | 16 | Transmitted data clock input from the system controller. |
| BUSY/VSAT | 19 | 17 | Output indicating the status of the RECC by providing output information based on a majority decision on the last 3 consecutive Busy/Idle bits (FVC = logic 0). Output level LOW means channel idle.<br>Indicating the result of the comparison of the measured SAT and the expected SAT colour-code bits ($I^2$C-bus register) in the voice channel mode (FVC = logic 1 and ENSM = logic 1). Output level LOW means incoming SAT not equal to expected SAT. |

Data processor for cellular radio
(DPROC2)

UMA1002

| SYMBOL | PIN | | DESCRIPTION |
|---|---|---|---|
| | SO28 | LQFP32 | |
| TXCTRL | 20 | 19 | Transmitter control open-drain output used to disable the transmitter during an RECC access failure. Output level LOW means RF disabled. |
| INVTX | 21 | 21 | This input inverts the sense of transmitted data stream, which allows RF modulators with high or low local oscillators to be used. The AMPS and TACS specifications define NRZ encoded logic 1 as a LOW-to-HIGH transition in the centre of a data bit period. The polarity of the modulated data stream depends on the transmitter local oscillator. Input LOW means data inverted. |
| TSCAN | 22 | 22 | Test switch input, only enabled if TST = logic 1, but should have a defined state. |
| A0 | 23 | 23 | Input to select the least significant bit of the I$^2$C-bus address. |
| SDA | 24 | 24 | Serial data input/output (I$^2$C-bus). |
| SCL | 25 | 25 | Serial clock input (I$^2$C-bus). |
| n.c. | 26 | 18 | Not connected. |
| RXCLK | 27 | 26 | Received data clock input from the system controller. |
| V$_{DDD}$ | 28 | 27 | Digital supply voltage (+3 V). |
| V$_{DDA}$ | – | 28 | Analog supply voltage (+3 V). |
| MVO | – | 3 | Majority voting output indicating that on FOCC the first 3 received words do not differ from each other and thus the majority decision over 5 words can already be carried out. Because of the required speed, indication is at this pin (and not via the I$^2$C-bus) which can be monitored by the system controller. Output LOW means the receiver can be switched off. |
| JTACS | – | 6 | Digital input signal for JTACS, input HIGH means that data is routed from TXLINE directly without processing to gated D/A converter (if enabled by STEN bit). |
| CLKSEL | – | 20 | Input switch for internal divide-by-8 or divide-by-1 divider between CLKIN and CLKOUT (internal pull-down → divide-by-1 is default if not bonded out in SO28 package). |

**Note**

1. Must not be connected in existing applications.

## FUNCTIONAL DESCRIPTION

### General

The UMA1002 (DPROC2) is a single-chip CMOS device which handles the data and supervisory functions of an AMPS or TACS subscriber set.

These functions are:

• Data reception and transmission

• Control and voice channel exchanges

• Error detection, correction, decoding and encoding

• Supervisory Audio Tone decoding and transponding

• Signalling Tone generation.

In an AMPS or TACS cellular telephone system, mobile stations communicate with a base over full duplex RF channels. A call is initially set up using one out of a number of dedicated control channels. This establishes a duplex voice connection using a pair of voice channels.
Any further transmission of control data occurs on these voice channels by briefly blanking the audio and simultaneously transmitting the data. The data burst is brief and barely noticeable by the user. A data rate of 10 kbits/s is used in the AMPS system and 8 kbits/s in TACS. The signalling formats for both Forward Channels (base to mobile) and Reverse Channels (mobile to base) are shown in Fig.14.

A function known as Supervisory Audio Tone (SAT), a set of 3 audio tones (5970, 6000 and 6030 Hz), is used to indicate the presence of the mobile on the designated voice channel. This signal, which is analogous to the On-Hook signal on land lines, is sent out to the mobile by the base station on the Forward Voice Channel. The signal must be accurately recovered and transponded back to the base station to complete the 'loop'. At the base station this signal is used to ascertain the overall quality of the communication link.

Another voice channel associated signal is Signalling Tone (ST). This tone (8 kHz TACS, 10 kHz AMPS) is generated by the mobile and is sent in conjunction with SAT on the Reverse Voice Channel to serve as an acknowledgement signal to a number of system orders.

The key requirements of a hand-held portable cellular set are:

• Small physical size

• Minimum number of interconnections (serial bus)

• Low power consumption

• Low cost.

The DPROC2 is a member of our Cellular Radio chip set, based on the $I^2C$-bus, which meets these requirements. A cellular radio system schematic using the chip set is shown in Fig.11.

### DPROC2 power-saving features

To support current saving in the application, DPROC2 has three different modes of circuit operation implemented. They are decoded by the $I^2C$-bus register bit FVC and by activity on the data transfer link (TXCLK and TXLINE). In power-down mode the relevant digital circuits have the clock disabled, the analog circuits have the bias currents and the switched capacitor clock switched off.

• Normal mode: all circuit parts are operating (e.g. on Voice channels)

• Power-down mode 1: the SAT path is in power-down (e.g. during access of the RECC)

• Power-down mode 2: the SAT path and the total data transmit path are in power-down (e.g. for Idle state, DPROC2 operating only on FOCC).

### System power-saving features

Besides the above mentioned power-down modes DPROC2 also includes features to reduce system current (e.g. switching off parts of the receiver, and put the system controller into Idle mode for longer periods of time). All these features are controlled by the $I^2C$-bus. For further explanation of the following features refer to the Section "I2C-bus serial data link (SDA; SCL)" sub-section "I2C-bus registers".

#### MAJORITY VOTING (ONLY IN LQFP32)

Majority voting includes more intelligence. This feature is enabled in FOCC with $I^2C$-bus bit MAJ = logic 1. If 3 consecutive identical words have been received it is signalled via pin MVO. Therefore during the last 2 frame words the receiver could be switched off to save system current consumption.

#### CONTROL FILLER WORDS FILTER

System current can be further reduced by an on-chip control filler words filter in FOCC, which enables the detection of consecutive identical control filler words. If consecutive control filler words are identical (i.e. DCC, CMAC and WFOM) they will not be passed on to the microcontroller. Consequently the system controller can remain in power-saving mode.

# Data processor for cellular radio (DPROC2)

# UMA1002

PROGRAMMING OF ESCC BITS

There is a possibility to program the expected ESCC bits, so that DPROC2 can compare expected and received SAT and signal any inconsistency to the system controller via BUSY/VSAT pin. Consequently there is no need to read the measured SAT periodically via the I²C-bus.

BCH ERROR FILTER

If this feature is enabled, DPROC2 will not pass on to the microcontroller words with BCH errors. Consequently the microcontroller can remain in power-saving mode. This feature in combination with the control filler feature is defined in Table 8.

SELECTABLE CLOCK DIVIDER (ONLY IN LQFP32)

An on-chip selectable divide-by-8 clock divider reduces external peripheral component count.

**Power-up state and master reset (RESET)**

RESET should be HIGH as soon as power supply is available.

DPROC2 will not respond reliably to any inputs (including RESET) until 100 µs after the power supply has settled within the specified tolerance. The analog sections of the device will have stabilized within 5 ms. No on-chip power-on reset is provided, therefore before the device can enter normal operation RESET must be held HIGH.

RESET is an active HIGH master reset input, with a minimum active pulse width of 4 µs which may be used to reset the total logic within DPROC2 to a predefined state as illustrated in Tables 1 and 2. It is preferably only used during power-up, during normal operation it is recommended to use the fully synchronous reset signals derived from the I²C-bus bits FVC, STS and TXRST (see Table 4). To ensure correct operation TXCLK must be held HIGH during RESET operation.

**Table 1**   Predefined state of the digital output pins

| OUTPUT | STATE |
|---|---|
| RXLINE | HIGH |
| TXCTRL | high-impedance (HIGH) |
| TACTRL | high-impedance (HIGH) |
| RACTRL | high-impedance (HIGH) |
| BUSY/VSAT | HIGH |
| TXLINE | HIGH (by 100 kΩ internal pull-up resistor) |
| RECDATA | LOW |
| MVO | HIGH |
| SDA | high-impedance (HIGH) |

**Table 2**   Predefined state of the I²C-bus registers

| Control 2 (write) | LOW | LOW | LOW | LOW | LOW | LOW | LOW | LOW |

Data processor for cellular radio
(DPROC2)

UMA1002

**I²C-bus serial data link (SDA; SCL)**

SDA is the bidirectional data line, SCL is the clock input
from an I²C-bus master. These constitute a typical I²C link
and conform to standard I²C-bus characteristics.
A detailed description of the I²C-bus specification, with
applications, is given in the brochure *"The I²C-bus and
how to use it"*. This brochure may be ordered using the
code 9398 393 40011.

• Data rate up to 100 kbits/s.

SLAVE ADDRESS SELECT (A0)

Selection of the device slave address is achieved by
connecting A0 to either $V_{SS}$ or $V_{DDD}$. The slave address is
defined in accordance with the I²C-bus specifications as
shown in Fig.4.

| 1 | 1 | 0 | 1 | 1 | X[1] | A0 | R/$\overline{W}$ |

*MBD831*

(1)  X = don't care.

Fig.4  Device slave address.

I²C-BUS REGISTERS

The I²C-bus register block resides internally within the
I²C-bus interface block and contains various items of
status and control information which are transferred to and
from DPROC2 via the I²C-bus. The block is organized into
three 8-bit registers:

• Status register which contains read only items

• Control registers 1 and 2 which contain write only items.

**Table 3**  I²C-bus register map

| REGISTER | BIT | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Status (read) | – | – | WSYNC | BUSY | TXABRT | TXIP | MSCC1 | MSCC0 |
| Control 1 (write) | BUFEN | SERV | STS | TXRST | ABREN | FVC | STEN | SATEN |

*MBD832*

(c)

(a) Read from DPROC2 status register.
(b) Write to DPROC2 control register 1.
(c) Write to all DPROC2 control registers.
Where:
S = START condition
W = read/write bit (logic 0 = write)
R = read/write bit (logic 1 = read)
A = acknowledge bit
P = STOP condition
DPROC ADR = slave address of DPROC2.

Fig.5  I$^2$C-bus data format.

**Table 4**   Description of I$^2$C-bus register map

| REGISTER BITS | LOGIC LEVEL | DESCRIPTION |
|---|---|---|
| **Control Register 1** | | |
| BUFEN | 0 | 1.2 MHz signal not available at pin CLKOUT |
| | 1 | 1.2 MHz signal is available at pin CLKOUT |
| SERV | 0 | serving system data stream B selected |
| | 1 | serving system data stream A selected |
| STS[1] | 0 | TACS selected |
| | 1 | AMPS selected |
| TXRST | 1 | terminates a message being transmitted on the reverse channel; monostable signal causing a reset of the message transmission circuitry and resets the I$^2$C-bus bits TXABRT, TXIP and clears the transmit buffer |
| ABREN | 1 | DPROC2 has permission to abort data transmission and disable RF on the RECC following the detection of a channel access attempt collision |
| | 0 | no permission for above operations |
| FVC[2] | 0 | control channel format selected |
| | 1 | voice channel format selected |
| STEN | 0 | disables output of signalling tone to pin DATA |
| | 1 | enables output of signalling tone to pin DATA if FVC = logic 1 |
| SATEN | 0 | disables output of SAT transponded signal to pin DATA |
| | 1 | enables output of SAT transponded signal to pin DATA if FVC = logic 1 |
| **Control Register 2** | | |
| MAJ | 0 | majority voting procedure on FOCC using all 5 frame words, MVO output is always HIGH |
| | 1 | majority voting procedure on FOCC using the first 3 frame words, if they are all identical the MVO pin goes LOW (see Fig.6) |
| MR0, MR1 | see Table 5 | determines set-up time of MVO signal with respect to beginning of the next dotting (see Fig.6) |
| DBCH | see Table 8 | BCH error filter |
| DCFM | see Table 8 | control filler message filter |
| ENSM | 0 | enable SAT monitoring; ESCC bits are not used |
| | 1 | enable SAT monitoring; ESCC bits are used for following function |
| ESCC0, ESCC1 | see Table 6 | expected SAT colour code bits; the incoming SAT is compared to these bits, the result (expected or not expected SAT frequency) is given out by the BUSY/VSAT pin (when FVC = logic 1), which prevents periodical reading from the I$^2$C-bus status register |
| **Status Register** | | |
| WSYNC | 0 | DPROC2 has not acquired frame synchronization in accordance with FOCC format |
| | 1 | DPROC2 has acquired frame synchronization in accordance with FOCC format |

| REGISTER BITS | LOGIC LEVEL | DESCRIPTION |
|---|---|---|
| BUSY | | indicates the status of RECC, determined by a majority decision on the result of the last 3 consecutive Busy/Idle bits of the FOCC and is also routed to pin BUSY/VSAT |
| | 0 | channel idle |
| | 1 | channel busy |
| | | indicates the result of the comparison of the incoming SAT and the stored SAT Colour Code bits in the Voice Channel mode and is also routed to pin BUSY/VSAT |
| | 0 | incoming SAT not equal to expected SAT |
| | 1 | incoming SAT equal to expected SAT |
| TXABRT | | indicates that a RECC access attempt has been aborted without successful message transmission |
| | 0 | no access collision detected |
| | 1 | transmission attempt aborted |
| TXIP | 0 | no transmission on RECC or RVC in progress |
| | 1 | data transmission by DPROC2 on RECC or RVC in progress |
| MSCC1, MSCC0 | see Table 7 | provides information about the current measured SAT colour code |

**Notes**

1. Changing this register bit resets internally the receive and transmit logic circuitry.

2. Changing this register bit resets internally the receive logic circuitry.

**Table 5**  Set-up time of MVO signal

UMA1002

**Digital circuit blocks**

GENERAL

The majority of the digital circuitry within the DPROC2
device is identical for both AMPS and TACS. The
interconnections of the digital blocks discussed below are
shown in Fig.1.

DATA RECOVERY

The Data Recovery Block receives wideband Manchester
encoded data in sampled and sliced form from the
Comparator Block, on which it performs the following
functions:

- Clock recovery
- Manchester decoding
- Data regeneration.

The Clock Recovery Block extracts an 8 or 10 kHz (TACS
or AMPS) phase-locked clock signal from the Manchester
encoded data stream. This is implemented using a
digital-phase-locked-loop (PLL) which has an adjustable
'bandwidth' to provide both fast acquisition and low jitter.

Manchester decoding is performed by exclusive ORing the
recovered Manchester encoded data with the recovered
clock.

The NRZ data regeneration is performed by a digital
integrate and dump circuit. This consists of an up/down
counter that counts 1.2 MHz cycles during the data period.
The sense of the count is determined by the result of the
Manchester Decoder output. The number of counts is
sampled at the end of a data period. If this number
exceeds a threshold the data is latched as a logic 1
otherwise it is latched as a logic 0.

SAT RECOVERY

The SAT Recovery Block receives a filtered and sliced
SAT signal which must be recovered before being routed
to the Determination and Regeneration Blocks.

The recovery is performed using a digital phase-locked
loop.

SAT DETERMINATION

The SAT Determination Block indicates which, if any, of
the valid SAT tones is detected from the recovered SAT.
The AMPS and TACS specifications require that a
determination is made at least every 250 ms.
Determination involves counting the number of cycles of
the regenerated SAT in this time period. This count is then
compared to a set of four known counts which define the
boundaries between the SAT frequencies and
SAT-not-valid events. The result is then coded into the $I^2C$
status registers MSCC0 and MSCC1.

SAT REGENERATION

The SAT Regeneration Block generates a digital SAT
stream for transponding back to the base station.
The transponded SAT is phase-locked to the recovered
SAT by means of a second digital phase-locked-loop.
To minimize the total harmonic distortion of the output
signal the transponded SAT is then processed by a delta
modulator before being passed on to the Gated
Digital-to-Analog (D/A) converter.

DOTTING DETECTOR

The Dotting Detector Block determines whether a data
inversion (dotting) pattern has been received on the
Forward Voice Channel. The detection of data inversion
indicates that the Clock Recovery Block has acquired bit
synchronization and that the narrow bandwidth mode on
the clock recovery phase-locked-loop is selected.
This signal is also used to indicate that a data burst is
expected and activates the audio mute RACTRL, after a
Word Synchronization Block has been received, for the
duration of the burst.

Data processor for cellular radio
(DPROC2)

UMA1002

WORD SYNCHRONIZATION DETECTOR

The Word Synchronization Block performs the following
functions:

• Frame Synchronization

• Reverse Control Channel status (B/I determination)

• Valid Serving System determination.

These functions are associated solely with the Forward
Control Channel and have no meaning on the Forward
Voice Channel.

Information in a data stream is identified by its position with
respect to a unique synchronization word.
This synchronization word is an 11-bit Barker code which
has a low probability of simulation in an error environment,
and can be easily detected. Data received is only
considered valid at times when DPROC2 has achieved
frame synchronization.

In this condition the block leaves its search mode and
enters its lock mode. This is indicated by bit WSYNC being
set HIGH. In order to achieve this two consecutive
synchronization words separated by 463 bits must be
detected. Once in lock mode, the synchronization word
detector is examined every 463 bits and only loses frame
synchronization after 5 consecutive unsuccessful
attempts at detecting the synchronization word have been
made. At this point bit WSYNC is cleared and the device is
returned to its search mode.

Information detailing the status of the Reverse Control
Channel is given by the Busy/Idle bits. These occur at
intervals of 11 bits within the frame, the first occurring
immediately following the synchronization word.
The status of the channel is determined by a majority
decision on the last three consecutive Busy/Idle bits.

FVC: After detection of 2 consecutive sync words the
circuit leaves its Search Mode and enters the Lock Mode.
The data word in between is considered as valid and
already stored for Majority Voting. Whenever a sync word
was found the incoming data stream is examined 88 bits
later for sync again. Whenever a valid sync word is
detected the following data word is given to the Majority
Voting block. After missing two consecutive sync words
the circuit goes back to the search mode (scanning for
sync every bit). If a sync word is then detected again, the
following data word is immediately accepted (and not only
after two correctly timed sync words). The detection
process of sync words is independent of the detection of
dotting. The audio mute via pin RACTRL is activated either
by receiving a sync word after detection of a dotting
sequence or by entering Lock Mode.

MAJORITY VOTING BLOCK

The Majority Voting Block performs the following functions:

• Identifying position and validity of frames in the received
data stream

• Extracting five repeats of each word from a valid frame

• Performing a bit-wise majority decision on the five
repeats of the data word.

The validity of the frames is determined by setting a
counter in operation which times out and resets the
circuitry after 920 or 463 bit periods from detecting valid
word synchronization. The time out period selected
depends on whether DPROC2 is monitoring the Forward
Voice or Control Channel respectively.

Up to five repeats of the message word are searched for
and extracted by DPROC2. On the Forward Voice
Channel the extraction of a data word for majority voting is
described in the Section "Word Synchronization Detector".

DPROC2 enables two mechanisms for Majority Voting.
The first is based on 5 words and is described above.
The other mechanism is based on 3 consecutive identical
words and thus enabling switch-off of parts of the receiver
during reception of the remaining two words (see Table 5
and Fig.6).

ERROR CORRECTION BLOCK

The Error Correction Block performs:

• Extraction of a valid message from the Majority-Voted
Word

• Computation of the S1 and S3 syndromes

• Correction of up to one error in the word

• Communication of received data to the System
Controller via the Received Data Serial Link.

Interpretation of parity of a received word is obtained from
knowledge of the syndromes of the word. The syndromes
are calculated using feedback shift registers with two
characteristic polynomials:

$1 + x + x^6$ and $1 + x + x^2 + x^4 + x^6$

Once the syndromes of a received word are known, it is
possible to determine if a correctable error is present.
DPROC2 only corrects up to one error although the code
used has a Hamming distance of five. The occurrence of
two or more errors is signalled by setting the BCH error
flag, which is communicated to the System Controller via
the Received Data Serial Link.

# Data processor for cellular radio (DPROC2)

# UMA1002

RECEIVED DATA SERIAL LINK

The Received Data Serial Link transfers data and control information from DPROC2 to the System Controller. The data is transferred on RXLINE under control of a clock signal RXCLK, generated by the System Controller. The system controller is informed of the arrival of a decoded data word in the DPROC2 output register by RXLINE being driven LOW. If the system controller chooses to ignore the received data or only partially clock the data out, the DPROC2 will reset the receive buffer for the next word after the period RWIN (see Fig.8).

*Data format*

Each Received Data word consists of 4 bytes. The word format is shown in Fig.7(a). The sense and function of the fields is shown in Table 9.

*Link protocol*

The Received Data protocol is described by the timing diagram Fig.8(a) and has the following parameters:

- Maximum receive window (RWIN)
  - Control Channel (TACS) = 47 ms; MAJ = 0
  - Control Channel (TACS) = 30.5 ms; MAJ = 1 (in FOCC only)
  - Control Channel (AMPS) = 37 ms; MAJ = 0
  - Control Channel (AMPS) = 23.8 ms; MAJ = 1 (in FOCC only)
- Minimum clock period ($t_{CLKmin}$) = 2 $\mu$s
- Minimum clock hold-off ($t_{WAIT}$) = 2 $\mu$s.

TRANSMIT DATA SERIAL INTERFACE

The Transmit Data Serial Link performs reception of data from the System Controller to DPROC2 over a dedicated line TXLINE. The transfer of data is synchronous with a clock signal TXCLK, generated by the System Controller.

*Data format*

Each Transmit Data word consists of 5 bytes. The word format is shown in Fig.7(b). The sense and function of the fields is shown in Table 10.

*Link protocol*

Messages are normally up to 5 words in length on the Reverse Control Channel and up to 2 words in length on the Reverse Voice Channel. However, DPROC2 will transmit messages of any word length. These must be transmitted on the data stream without interruption. To avoid the need for large buffer areas, a flexible protocol is used to allow DPROC2 to control the transfer of data words. DPROC2 has an on-chip buffer which can hold one complete word of a message. While new words are being loaded into DPROC2, within the time period Buffer clear to end of TWIN, DPROC2 will maintain uninterrupted data transmission. The System Controller can abort the transmission of a message at any point activating the I²C-bus signal TXRST. This signal causes the interface to return to its power-up state and resets TXIP and TXABRT (see Table 4). On completion of these tasks TXRST will return to its inactive state. The Transmit Data Protocol is described by the timing diagram shown in Fig.8(b) and has the following parameters:

- Maximum transmit window (TWIN)
  - voice channel (TACS) = 60 ms
  - voice channel (AMPS) = 48 ms
  - control channel (TACS) = 29 ms
  - control channel (AMPS) = 23 ms
- Minimum clock period ($t_{CLKmin}$) = 2 $\mu$s
- Minimum wait period ($t_{WAIT}$) = 2 $\mu$s.

Note that TXRST will clear the transmit buffer.

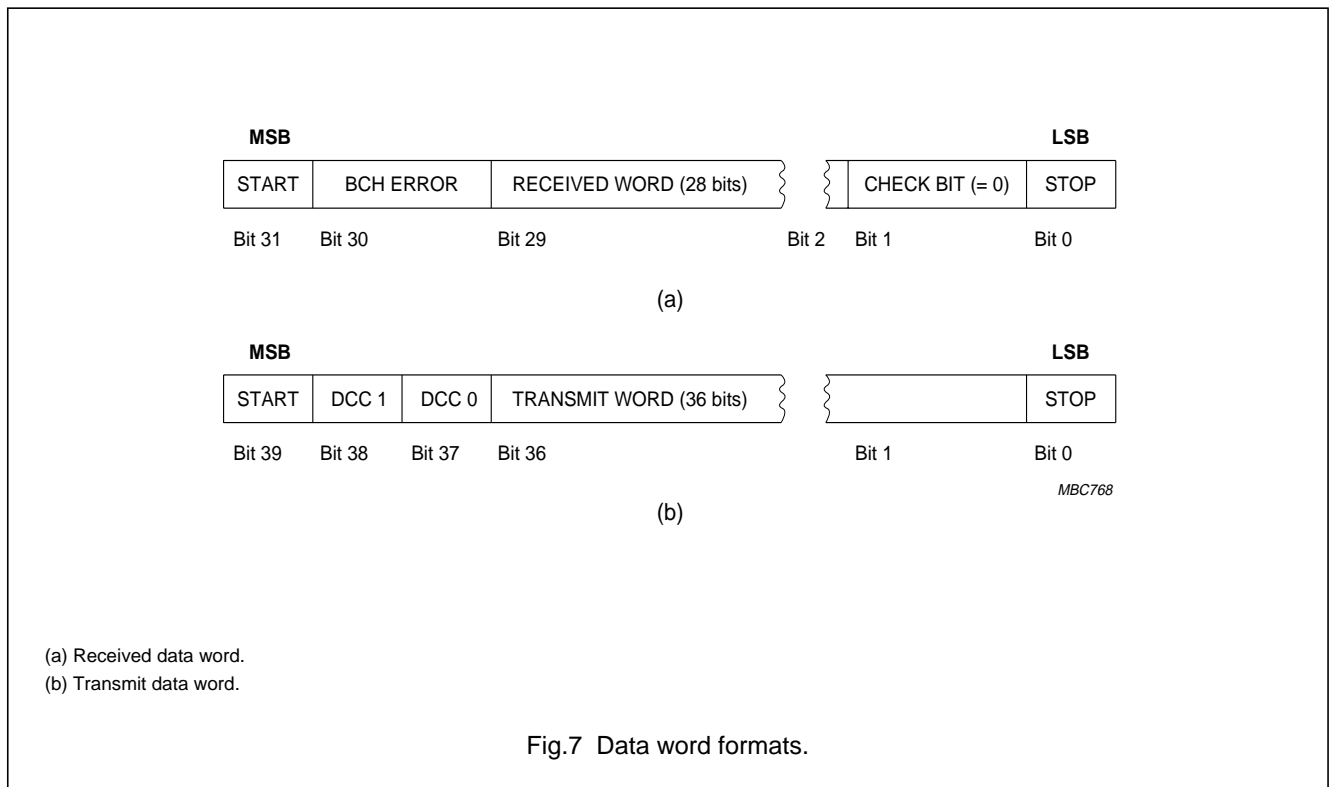

Data processor for cellular radio
(DPROC2)

UMA1002

(1) The buffer time depends on whether the first or subsequent words are being loaded.

(2) The system controller should monitor the TXLINE during bit 0, if the status of TXLINE does not change from a HIGH-to-LOW on the rising edge of TXCLK, then a framing error has occurred. This can be caused by glitches on the clock line or if an arbitration error occurred while the DPROC2 transmit register was being loaded. The system controller should recover the situation by holding TXLINE HIGH and supplying clocks on TXCLK until TXLINE goes LOW. Then the situation should be treated as a normal channel arbitration failure as described in Section "Reverse Control Channel Access Arbitration" - "Abort procedure (see Fig.10)".

# UMA1002

BCH AND MANCHESTER ENCODING BLOCK

The functions performed by this circuit block include:

- Reception of data from the System Controller
- Parity generation
- Message construction
- Manchester encoding.

Each 36-bit Information Word sent on the Reverse Voice and Control Channels is coded into a 48-bit code word. The code word consists of the 36-bit word followed by 12 parity bits. These parity bits are formed by clocking the information word into a 12-bit feedback shift register with characteristic polynomial:

$1 + x^3 + x^4 + x^5 + x^8 + x^{10} + x^{12}$

The BCH Encoder Block constructs the Reverse Voice and Control Channel data streams from the information it receives from the System Controller.

The streams are formed out of the four possible field types:

- Dotting (data inversions)
- 11-bit Synchronization Word
- Digital Colour Code (see Table 11)
- 48-bit code word.

The 2 bits of DCC received from the System Controller are coded into a 7-bit word as shown in Table 11.

The data sense for Manchester Encoding has a NRZ logic 1 encoded as a 0-to-1 transition and a NRZ logic 0 encoded as a 1-to-0 transition.

REVERSE CONTROL CHANNEL ACCESS ARBITRATION

The AMPS and TACS specifications require a method of arbitration on the Reverse Control Channel to prevent two mobiles from transmitting on the same channel at the same time.
This function is performed by DPROC2 monitoring the Busy/Idle stream sent on the Forward Control Channel.

The AMPS and TACS specifications state that once the mobile has commenced transmitting on the Reverse Control Channel it must monitor the Busy/Idle stream. If this stream becomes active outside a predetermined 'window', measured from the start of the transmission of the message, the mobile must terminate its transmission and disable the transmitter immediately.

In the Cellular Radio chip-set there are two levels of control of the RF transmitter; the first is absolute control by the System Controller, the second is conditional by other devices in the set. In DPROC2 the conditional control of the transmitter is performed via the output TXCTRL. This line is effectively wired ORed together, using open-drain outputs, with other devices which may wish to control the transmitter. When these devices do not wish to disable the transmitter their output is in a HIGH impedance state.

An exception to this procedure occurs when the Serving System instructs the mobile not to monitor the Busy/Idle bits. In this event the arbitration logic can be disabled by clearing I$^2$C-bus register bit ABREN.

The flow of events during a Control Channel Access attempt is as follows:

*Initial state*

- Transmitter disabled
- DPROC2 transmit circuitry in power-up state
- TXCTRL line HIGH.

**Table 11** Digital colour code; 7-bit word

| DCC1 | DCC0 | CODED DCC | | | | | | |
|------|------|-----------|---|---|---|---|---|---|
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 1 |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 |

Data processor for cellular radio
(DPROC2)

UMA1002

*Access attempt procedure*

1. System Controller decides to send message[1].

2. System Controller drives TXCTRL LOW directly.

3. System Controller switches transmitter power-on and waits for power-up for the transmitter module (RF transmitter is still disabled by TXCTRL).

4. System Controller sets TXRST via I²C-bus to DPROC2.

5. System Controller sets ABREN via I²C (if required) allowing DPROC2 to control the transmitter.

6. System Controller determines status of Reverse Control Channel by monitoring the Busy/Idle bit. If busy, waits a random time then tries again.

7. System Controller releases TXCTRL allowing it to be pulled HIGH enabling the transmitter output.

8. System Controller transfers the first word of the message to DPROC2 via serial link[1].

9. DPROC2 sets I²C-bus signal TXIP and starts sending message while monitoring Busy/Idle status.

10. If channel becomes busy before 56 bits and ABREN is set then perform Abort Procedure.

11. If channel remains idle after 104 bits and ABREN is set then perform Abort Procedure.

12. System controller loads the subsequent words of the message into DPROC2 when the buffer becomes clear as shown in Fig.8(b).

13. On completion of entire message DPROC2 clears TXIP and 25 ms later the System Controller disables transmitter via I²C-bus.

14. System Controller finally sends TXRST to prepare DPROC2 for next transmission.

*Abort procedure (see Fig.10)*

1. DPROC2 immediately disables transmitter output by driving TXCTRL LOW.

2. DPROC2 sets TXABRT.

3. System Controller detects failure by monitoring TXCTRL and TXABRT.

4. System Controller disables transmitter via RF power amplifier.

5. System Controller sends TXRST to prepare DPROC2 for next transmission.

SIGNAL TONE GENERATION (ST)

The 8 or 10 kHz (TACS or AMPS) tone generated from the Manchester Encoding Block is used as the Signalling Tone stream.

---

(1) At stage 1 the system controller may choose to preload DPROC2 with the first word of the message and hold it from transmission until stage 7 using the TXHOLD line. This gives a lower time overhead between detecting an IDLE channel and commencing the transmission. To use this feature TXHOLD must be driven HIGH before the last bit of data has been transferred into DPROC2. Figure 9 illustrates the DPROC2 data transmission timing.

**Analog circuit blocks**

GENERAL

The analog signal processing functions on DPROC2 are
implemented using switched-capacitor techniques.
The main filtering functions are operated at 300 kHz, and
these circuits are 'interfaced' to the continuous time and
sampled digital domains by RC active filters, passive
interpolators and comparators.

The RC sections, the Anti-Alias Filter and the Clock Filter,
are non-critical and are designed to tolerate process
spreads. The critical filtering in the SAT Filter and the
Output Filter, is performed by 300 kHz switched-capacitor
circuitry. The Passive Interpolator increases the sampling
rate from 300 kHz to 1.2 MHz. The sampled analog
signals from the Passive Interpolator is converted to a
sampled 2-state digital signal by a Comparator. The Gated
D/A converter blocks and Analog Summer block together
perform resynchronization and sub-sampling of the
digitally generated DPROC2 output signals, and
conversion to the sampled analog domain.

These analog sections of the device are shown in Fig.1.

BIAS GENERATOR

The Bias Generator generates the analog ground
reference voltage (AGND) used internally within the
DPROC2 device. To minimize noise AGND must be
externally decoupled to $V_{SSA}$ as shown in Fig.12. It also
contains a current reference to generate all bias currents
for the analog circuits.

ANTI-ALIASING FILTER

The Anti-Aliasing Filter is placed before the SAT filter block
to prevent any unwanted signals or high-frequency noise
present on the DEMODD pin being aliased into the
pass-band by the sampling action of the
switched-capacitor filter. To achieve this the Anti-Aliasing
Filter is a time-continuous RC-active low-pass filter.

SAT INPUT FILTER

The SAT Input Filter is a switched-capacitor filter which
provides band-pass filtering of the SAT signals from the
DEMODD pin to improve the SAT signal-to-noise ratio
prior to recovery and transponding.

PASSIVE INTERPOLATOR

The function of the Passive Interpolator is to increase the
sampling rate at the output of the SAT filter. This reduces
the coarseness of the zero-crossing information which

would otherwise cause unacceptable isochronous
distortion in the recovered signal.

COMPARATORS

The Comparators form the analog-to-digital interface for
the received data and SAT signals from the DEMODD pin.
These comparators act as limiting amplifiers which convert
the filtered sampled analog signals into 2-state sampled
digital signals containing only the zero-crossing
information from the analog signal. To prevent unwanted
signals being processed by the digital circuitry both
comparators have a hysteresis implemented

GATED D/A CONVERTERS AND ANALOG SUMMER

The Gated D/A converters and Analog Summer form the
interface between the digital and analog circuitry on the
transmit path of DPROC2. It is at this point that the three
sampled digital signals, containing SAT, ST and encoded
digital data, are combined to form a composite signal.

The data streams are enabled by the I²C signals STEN,
SATEN and the internal signal DATAEN respectively
(DATAEN disables SAT and ST when data is being
transmitted). The digital-to-analog conversion and
sub-sampling operation is performed by the Gated D/A
converters and Analog Summer.
The typical relative signal weights applied in the summer
(with respect to the data path) are shown in Table 12.

**Table 12**  Typical relative signal weight

| SIGNAL | RELATIVE OUTPUT LEVEL AMPS AND TACS |
|---|---|
| ST or DATA | 1.0 |
| SAT | 0.25 |

OUTPUT FILTER

The Output Filter is a switched-capacitor filter which
performs band-limiting of the DPROC2 output signals in
accordance with the AMPS and TACS specifications.
The required below band roll-off is achieved via external
AC-coupling from the DATA pin.

CLOCK FILTER

The Clock Noise Filter is a non-critical continuous time
RC-active low-pass filter used to remove any switching
transient residues from the output signal. It contains an
output driver stage to provide a low output impedance and
sufficient driving capability for the pin DATA.

## SOLDERING

### Introduction

There is no soldering method that is ideal for all IC
packages. Wave soldering is often preferred when
through-hole and surface mounted components are mixed
on one printed-circuit board. However, wave soldering is
not always suitable for surface mounted ICs, or for
printed-circuits with high population densities. In these
situations reflow soldering is often used.

This text gives a very brief insight to a complex technology.
A more in-depth account of soldering ICs can be found in
our *"IC Package Databook"* (order code 9398 652 90011).

### Reflow soldering

Reflow soldering techniques are suitable for all QFP and
SO packages.

The choice of heating method may be influenced by larger
plastic QFP packages (44 leads, or more). If infrared or
vapour phase heating is used and the large packages are
not absolutely dry (less than 0.1% moisture content by
weight), vaporization of the small amount of moisture in
them can cause cracking of the plastic body. For more
information, refer to the Drypack chapter in our *"Quality
Reference Manual"* (order code 9398 510 63011).

Reflow soldering requires solder paste (a suspension of
fine solder particles, flux and binding agent) to be applied
to the printed-circuit board by screen printing, stencilling or
pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example,
thermal conduction by heated belt. Dwell times vary
between 50 and 300 seconds depending on heating
method. Typical reflow temperatures range from
215 to 250 °C.

Preheating is necessary to dry the paste and evaporate
the binding agent. Preheating duration: 45 minutes at
45 °C.

### Wave soldering

QFP

Wave soldering is **not** recommended for QFP packages.
This is because of the likelihood of solder bridging due to
closely-spaced leads and the possibility of incomplete
solder penetration in multi-lead devices.

**If wave soldering cannot be avoided, the following
conditions must be observed:**

- **A double-wave (a turbulent wave with high upward
  pressure followed by a smooth laminar wave)
  soldering technique should be used.**

- **The footprint must be at an angle of 45° to the board
  direction and must incorporate solder thieves
  downstream and at the side corners.**

**Even with these conditions, do not consider wave
soldering the following packages: QFP52 (SOT379-1),
QFP100 (SOT317-1), QFP100 (SOT317-2),
QFP100 (SOT382-1) or QFP160 (SOT322-1).**

SO

Wave soldering techniques can be used for all SO
packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward
  pressure followed by a smooth laminar wave) soldering
  technique should be used.

- The longitudinal axis of the package footprint must be
  parallel to the solder flow.

- The package footprint must incorporate solder thieves at
  the downstream end.

METHOD (QFP AND SO)

During placement and before soldering, the package must
be fixed with a droplet of adhesive. The adhesive can be
applied by screen printing, pin transfer or syringe
dispensing. The package can be soldered after the
adhesive is cured.

Maximum permissible solder temperature is 260 °C, and
maximum duration of package immersion in solder is
10 seconds, if cooled to less than 150 °C within
6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal
of corrosive residues in most applications.

### Repairing soldered joints

Fix the component by first soldering two diagonally-
opposite end leads. Use only a low voltage soldering iron
(less than 24 V) applied to the flat part of the lead. Contact
time must be limited to 10 seconds at up to 300 °C. When
using a dedicated tool, all other leads can be soldered in
one operation within 2 to 5 seconds between
270 and 320 °C.

**DEFINITIONS**

| Data sheet status | |
|---|---|
| Objective specification | This data sheet contains target or goal specifications for product development. |
| Preliminary specification | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification | This data sheet contains final product specifications. |
| **Limiting values** | |
| Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability. | |
| **Application information** | |
| Where application information is given, it is advisory and does not form part of the specification. | |

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

**PURCHASE OF PHILIPS I²C COMPONENTS**

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
