BIPOLAR ANALOG INTEGRATED CIRCUIT **μ PC1470H**

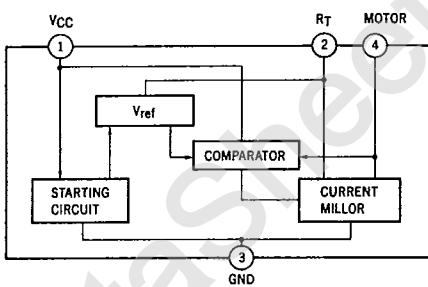

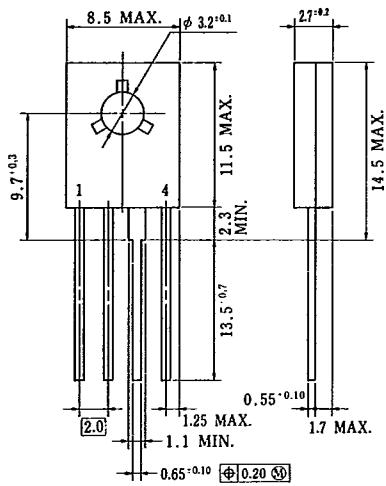

T-77-21

MOTOR SPEED REGULATORS**DESCRIPTION**

The μ PC1470H is a monolithic integrated circuit intended as speed regulators for DC motors of record players, tape and cassette recorders etc. The device is packaged in a new developed 4-lead quase-TO-126 plastic case.

FEATURES

- Excellent versatility in use.
- High Output current.
- Low Quiescent current.
- Low Reference voltage.
- Excellent parameters stability versus temperature.
- Excellent characteristic at low supply voltage.

APPLICATION INFORMATION

[BASIC EQUATION FOR THE MOTOR]

$$\begin{cases} E_t = V_{\text{ref}} + R_T (i_2 + \frac{V_{\text{ref}}}{R_S}) \\ i_2 = \frac{1}{K} i_4 + i_q \\ i_4 = i_m + \frac{V_{\text{ref}}}{R_S} \end{cases}$$

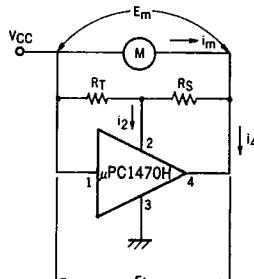

$$E_t = V_{\text{ref}} + R_T (\frac{1}{K} i_4 + i_q + \frac{V_{\text{ref}}}{R_S})$$

$$E_t = V_{\text{ref}} + R_T \left\{ \frac{1}{K} (i_m + \frac{V_{\text{ref}}}{R_S}) + i_q + \frac{V_{\text{ref}}}{R_S} \right\}$$

$$E_t = V_{\text{ref}} \left\{ 1 + \frac{R_T}{R_S} \left(1 + \frac{1}{K} \right) \right\} + R_T i_q + \frac{R_T}{K} i_m$$

They also give: $E_m = E_o + R_m i_m$

$$\begin{cases} E_o = V_{\text{ref}} \left\{ 1 + \frac{R_T}{R_S} \left(1 + \frac{1}{K} \right) \right\} + R_T i_q \\ R_m = \frac{R_T}{K} \end{cases}$$

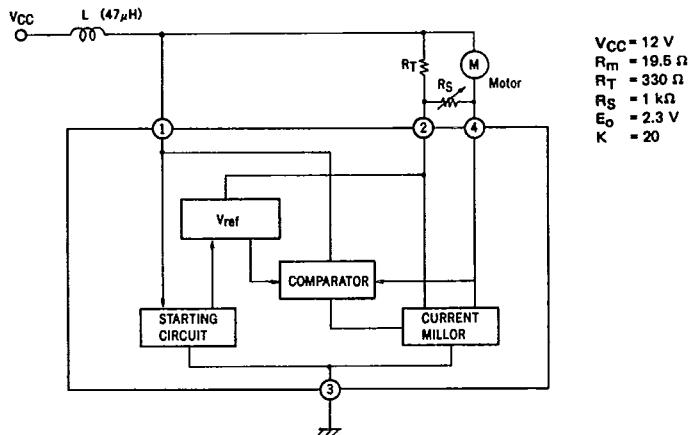

E_o : Back Electromotive Force
 R_m : Internal Resistance (of the Motor)
 K : Reflection Coefficient ($= i_4/i_2$)

APPLICATION CIRCUIT

Note 1. The motor speed can be adjusted by the variable resistor R_S .

$$R_{S\min.} = \frac{V_{ref} \cdot R_T}{E_0 - V_{ref} - I_q \cdot R_T}$$

Note 2. If $R_T \text{ max.} > K \cdot R_m \text{ min.}$, instability of the motor may occur.
