MOS INTEGRATED CIRCUIT

μPD784927, 784928, 784927Y, 784928Y

16-BIT SINGLE-CHIP MICROCONTROLLER

DESCRIPTION

The μPD784927 and 784928 are members of the NEC 78K/IV Series of microcontrollers equipped with a high-speed, high-performance 16-bit CPU for VCR software servo control.

The μPD784927Y and 784928Y are based on the μPD784928 with the addition of an I^2C bus interface compatible with multi-master.

They contain many peripheral hardware units ideal for VCR control, such as a multi-function timer unit (super timer unit) for software servo control and VCR analog circuits.

Flash memory models, the μPD78F4928 and μPD78F4928Y, are under development.

The functions of the μPD784927 is described in detail in the following User's Manual. Be sure to read this manual before designing your system.

μPD784928, 784928Y Subseries User's Manual - Hardware : U12648E

78K/IV Series User's Manual - Instruction : U10905E

FEATURES

- High instruction execution speed realized by 16-bit CPU core
  - Minimum instruction execution time: 250 ns (with 8 MHz internal clock)
- ★ High internal memory capacity

Item \ Part Number	μPD784927, 784927Y	μPD784928, 784928Y
Internal ROM capacity	96K bytes	128K bytes
Internal RAM capacity	2048 bytes	3584 bytes

- VCR analog circuits conforming to VHS Standard
  - CTL amplifier
  - RECCTL driver (rewritable)
  - CFG amplifier
  - DFG amplifier
  - DPG amplifier
  - DPFG separation circuit (ternary separation circuit)
  - Reel FG comparator (2 channels)
  - CSYNC comparator
- Timer unit (super timer unit) for servo control
- Serial interface : 3 channels
- 3-wire serial I/O : 2 channels
- I^2C bus interface: 1 channel
- A/D converter: 12 channels (conversion time: 10 μs)
- Low-frequency oscillation mode: main system clock frequency = internal clock frequency
- Low-power consumption mode: CPU can operate with a subsystem clock.
- Supply voltage range: V_{DD} = +2.7 to 5.5 V
- Hardware watch function: watch operation at low voltage (V_{DD} = 2.7 V (MIN.)) and low current consumption

Unless otherwise specified, the μPD784927 is treated as the representative model throughout this document.

3. INTERNAL BLOCK FUNCTION

3.1 CPU Registers

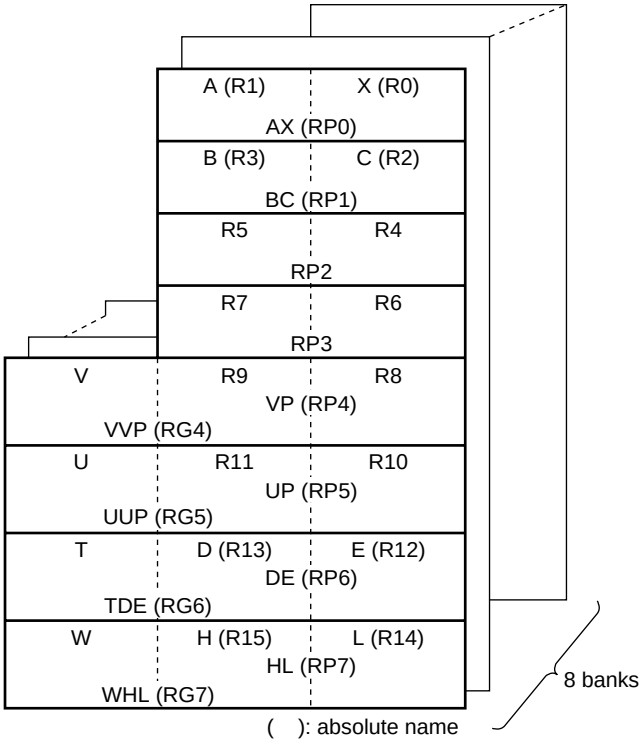
3.1.1 General-purpose registers

The μPD784927 has eight banks of general-purpose registers. One bank consists of sixteen 8-bit general-purpose registers. Two of these 8-bit registers can be used in pairs as a 16-bit register. Four of the 16-bit general-purpose registers can be used to specify a 24-bit address in combination with an 8-bit address expansion register.

These eight banks of general-purpose registers can be selected by software or context switching function.

The general-purpose registers, except for the address expansion registers V, U, T, and W, are mapped to the internal RAM.

Figure 3-1. Configuration of General-Purpose Register

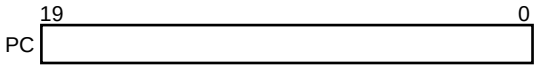


Caution Although R4, R5, R6, R7, RP2, and RP3 can be used as X, A, C, B, AX, and BC registers, respectively, by setting the RSS bit of PSW to 1, do not use this function. The function of the RSS bit is planned to be deleted from the future models in the 78K/IV Series.

3.1.2 Other CPU registers

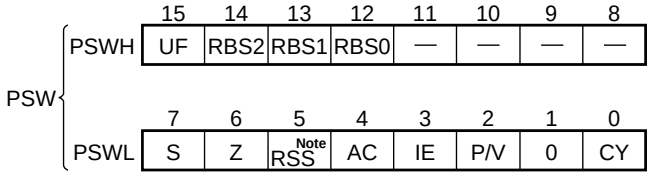
(1) Program counter

The program counter of the μPD784927 is 20 bits wide. The value of the program counter is automatically updated as the program is executed.



(2) Program status word

This is a register that holds the various statuses of the CPU. Its contents are automatically updated as the program is executed.

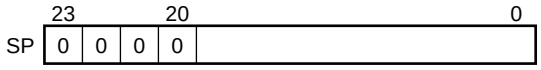


Note The RSS flag is provided to maintain compatibility with the microcomputers in the 78K/III Series. Always clear this flag to 0 except when the software of the 78K/III Series is used.

(3) Stack pointer

This is a 24-bit pointer that holds the first address of the stack.

Be sure to write 0 to the high-order 4 bits.



3.2 Memory Space

A memory space of 1M bytes can be accessed. The mapping of the internal data area (special function registers and internal RAM) can be selected by using the LOCATION instruction. The LOCATION instruction must be always executed after reset has been cleared, and cannot be used more than once.

★ **(1) When LOCATION 0H instruction is executed**

Part Number	Internal Data Area	Internal ROM Area
μPD784927, 784927Y	0F700H-0FFFFH	00000H-0F6FFH 10000H-17FFFH
μPD784928, 784928Y	0F100H-0FFFFH	00000H-0F0FFH 10000H-1FFFFH

Remark The area of the internal ROM overlapping the internal data area cannot be used when the LOCATION 0 instruction is executed.

Part Number	Unusable Area
μPD784927, 784927Y	0F700H-0FFFFH (2304 bytes)
μPD784928, 784928Y	0F100H-0FFFFH (3840 bytes)

Notes 1. Accessed in external memory expansion mode

2. The 3840 bytes in this area can be used as an internal ROM only when the LOCATION 0FH instruction is executed.

3. When LOCATION 0H instruction is executed: 127232 bytes, when LOCATION 0FH instruction is executed: 131072 bytes

4. Base area or entry area for reset or interrupt. Excluding the internal RAM for reset.

3.3 Special Function Registers (SFRs)

Special function registers are assigned special functions and mapped to a 256-byte space of addresses FF00H through FFFFH. These registers include mode registers and control registers that control the internal peripheral hardware units.

Caution Do not access an address to which no SFR is assigned. If such an address is accessed by mistake, the μPD784927 may be deadlocked. This deadlock can be cleared only by reset input.

Table 3-1 lists the special function registers (SFRs). The meanings of the symbols in this table are as follows:

- Symbol ..... Abbreviation of an SFR. This abbreviation is reserved for NEC's assembler (RA78K4). With a C compiler (CC78K4), the abbreviation can be used as sfr variable by the #pragma sfr instruction.

- R/W ..... Indicates whether the SFR in question can be read or written.
  R/W : Read/write
  R : Read only
  W : Write only

- Bit length ..... Indicates the bit length (word length) of the SFR.

- Bit units for manipulation ..... Indicates bit units in which the SFR in question can be manipulated. An SFR that can be manipulated in 16-bit units can be used as the operand sfrp of an instruction. Specify an even address to manipulate this SFR.
  An SFR that can be manipulated in 1-bit units can be used for a bit manipulation instruction.

- After clearing reset ..... Indicates the status of each register immediately after clearing reset.

Caution The addresses shown in Table 3-1 are used when the LOCATION 0H instruction is executed. Add "F0000H" to the address values shown in the table when the LOCATION 0FH instruction is executed.

3.4 Ports

The μPD784927 is provided with the ports shown in Figure 3-3. Table 3-2 shows the function of each port.

Figure 3-4. Port Configuration

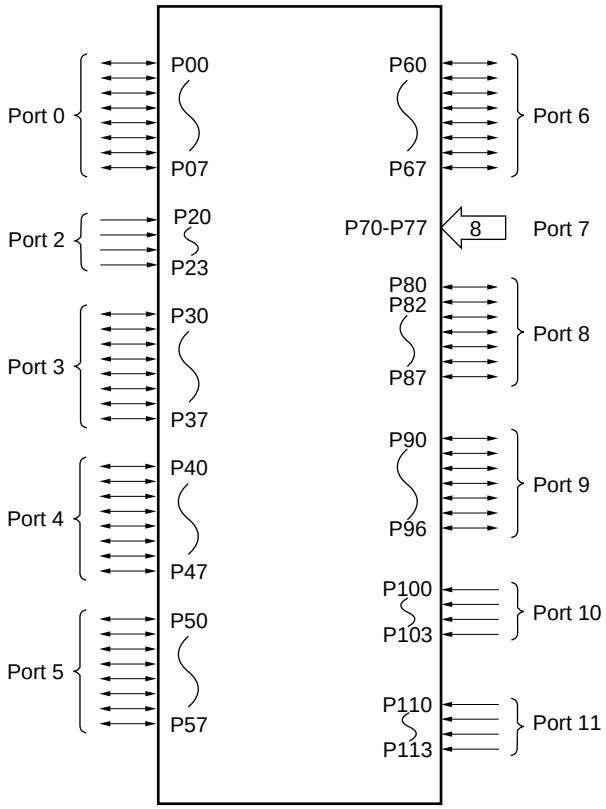

Table 3-2. Port Function

Name	Pin Name	Function	Specification of Pull-up Resistor
Port 0	P00-P07	Can be set in input or output mode in 1-bit units.	Pull-up resistors are connected to all pins in input mode.
Port 2	P20-P23	Input port	Pull-up resistors are connected to pins P22 and P23.
Port 3	P30-P37	Can be set in input or output mode in 1-bit units.	Pull-up resistors are connected to all pins in input mode.
Port 4	P40-P47	Can be set in input or output mode in 1-bit units. Can directly drive LED.	
Port 5	P50-P57	Can be set in input or output mode in 1-bit units.	
Port 6	P60-P67		
Port 7	P70-P77	Input port	Pull-up resistor is not provided.
Port 8	P80, P82-P87	Can be set in input or output mode in 1-bit units.	Pull-up resistors are connected to all pins in input mode.
Port 9	P90-P96		
Port 10	P100-P103	Input port	Pull-up resistor is not provided.
Port 11	P110-P113		

3.5 Real-Time Output Port

A real-time output port consists of a port output latch and a buffer register (refer to **Figure 3-5**).

The function to transfer the data prepared in advance in the buffer register to the output latch when a trigger such as a timer interrupt occurs, and output the data to an external device is called a real-time output function. A port used in this way is called a real-time output port (RTP).

Table 3-3 shows the real-time output ports of the μPD784927.

Table 3-4 shows the trigger sources of RTPs.

Figure 3-5. Configuration of RTP

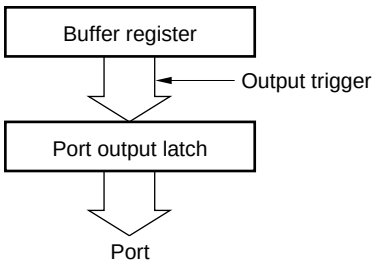

Table 3-3. Bit Configuration of RTP

RTP	Shared with:	Number of Bits of Real-Time Output Data	Number of Bits That Can Be Specified as RTP	Remark
RTP0	Port 0	4 bits × 2 channels or 8 bits × 1 channel	4-bit units	—
RTP8	Port 8	1 bit × 1 channel and 2 bits × 1 channel	1-bit units	Pseudo V_{SYNC} output: 1 channel (RTP80) Head amplifier switch: 1 channel (RTP82) Chrominance rotation signal output: 1 channel (RTP83)

Table 3-4. Trigger Sources of RTP

RTP \ Trigger Source		INTCR00	INTCR01	INTCR02	INTCR13	INTCR50	INTP0	Remark
RTP0	High-order 4 bits		○					
	Low-order 4 bits			○			○	
	All 8 bits			○			○	
RTP8	Bit 0		○	○	○	○		**Note 1**
	Bits 2 and 3	○						**Note 2**

Notes 1. Select one of the four trigger sources.

2. When the real-time output port mode is set by the port mode control register 8 (PMC8), the HASW and ROT-C signals that are set by the head amplifier switch output control register (HAPC) are directly output. The HASW and ROT-C signals are synchronized with HSW output (TM0-CR00 coincidence signal). However, the set signal is output immediately when the HAPC register is rewritten.

Figures 3-6 and 3-7 show the block diagrams of RTP0 and RTP8. Figure 3-8 shows the types of RTP output trigger sources.

Remark INTCR01: TM0-CR01 coincidence signal
INTCR02: TM0-CR02 coincidence signal

Figure 3-7. Block Diagram of RTP8

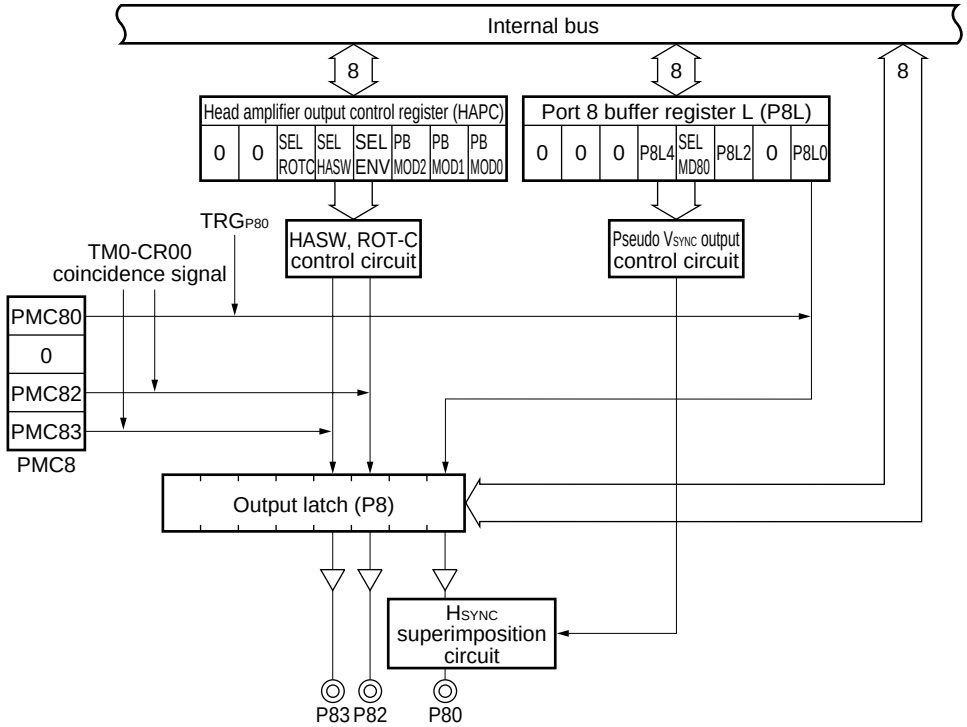

Figure 3-8. Types of RTP Output Trigger Sources

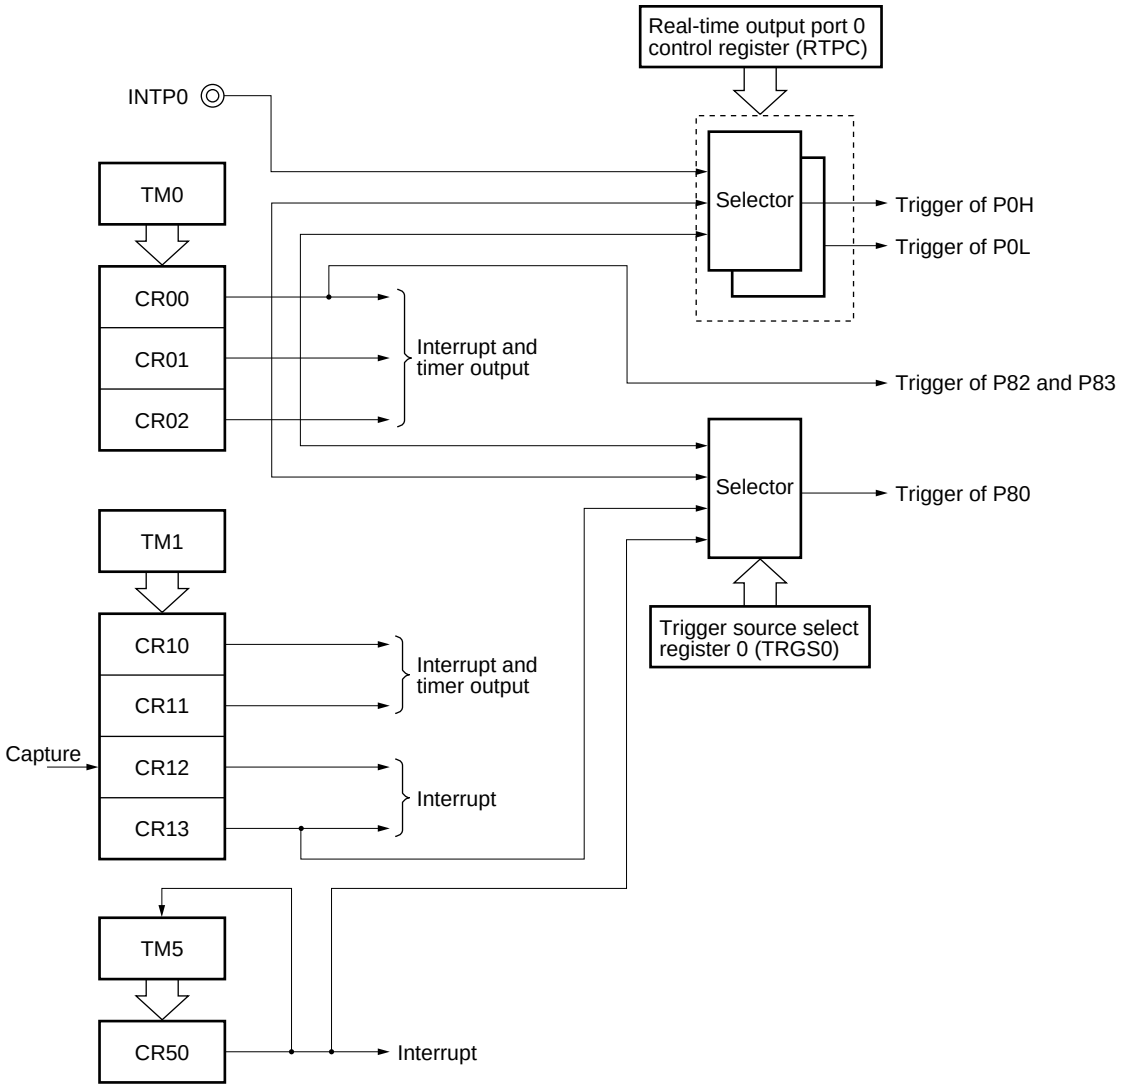

RTP80 can output low-level, high-level, and high-impedance values real-time.

Because RTP80 can superimpose a horizontal sync signal, it can be used to create pseudo vertical sync signal. When RTP80 is set in the pseudo V_{SYNC} output mode, it repeatedly outputs a specific pattern when an output trigger occurs.

Figure 3-9 shows the operation timing of RTP80.

3.6 Super Timer Unit

The μPD784927 is provided with a super timer unit that consists of the timers, and VCR special circuits such as a VISS detection circuit and a V_{SYNC} separation circuit, etc., shown in Table 3-5.

Table 3-5. Configuration of Super Timer Unit

Unit Name	Timer/Counter	Resolution	Maximum Count Time	Register	Remark
Timer 0	TM0 (16-bit timer)	1 μs	65.5 ms	CR00	Controls delay of video head switching signal
				CR01	Controls delay of audio head switching signal
				CR02	Controls pseudo V_{SYNC} output timing
	EC (8-bit counter)	—	—	ECC0, ECC1, ECC2, ECC3	Creates internal head switching signal
Free running counter	FRC (22-bit counter)	125 ns	524 ms	CPT0	Detects reference phase (to control drum phase)
				CPT1	Detects phase of drum motor (to control drum phase)
				CPT2	Detects speed of drum motor (to control drum speed)
				CPT3	Detects speed of capstan motor (to control speed of capstan motor)
				CPT4, CPT5	Detects remaining tape for reel FG
Timer 1	TM1 (16-bit timer)	1 μs	65.5 ms	CR10	Playback: Creates internal reference signal Recording: Buffer oscillator in case V_{SYNC} is missing
				CR11	Controls RECCTL output timing
				CR12	Detects phase of capstan motor (to control capstan phase)
				CR13	Controls V_{SYNC} mask as noise preventive measures
	TM3 (16-bit timer)	1 μs or 1.1 μs	65.5 ms or 71.5 ms	CR30, CR31	Controls duty detection timing of PBCTL signal
				CPT30	Measures cycle of PBCTL signal
	EDV (8-bit counter)	—	—	EDVC	Divides CFG signal frequency
Timer 2	TM2 (16-bit timer)	1 μs	65.5 ms	CR20	Can be used as interval timer (to control system)
Timer 4	TM4 (16-bit timer)	2 μs	131 ms	CR40	Detects duty of remote controller signal (to decode remote controller signal)
				CR41	Measures cycle of remote controller signal (to de code remote controller signal)
Timer 5	TM5 (16-bit timer)	2 μs	131 ms	CR50	Can be used as interval timer (to control system)
Up/down counter	UDC (5-bit counter)	—	—	UDCC	Creates linear tape counter
PWM output unit	—	—	—	PWM0, PWM1, PWM5	16-bit resolution (carrier frequency: 62.5 kHz)
				PWM2, PWM3, PWM4	8-bit resolution (carrier frequency: 62.5 kHz)

(1) Timer 0 unit

Timer 0 unit creates head switching signal and pseudo V_{SYNC} output timing from the PG and FG signals of the drum motor.

This unit consists of an event counter (EC: 8 bits), compare registers (ECC0 through ECC3), a timer (TM0: 16 bits), and compare registers (CR00 through CR02).

A signal indicating coincidence between the value of timer 0 and the value of a compare register can be used as the output trigger of the real-time output port.

(2) Free running counter unit

The free running counter unit detects the speed and phase of the drum motor, and the speed and reel speed of the capstan motor.

This unit consists of a free running counter (FRC), capture registers (CPT0 through CPT5), a V_{SYNC} separation circuit, and a H_{SYNC} separation circuit.

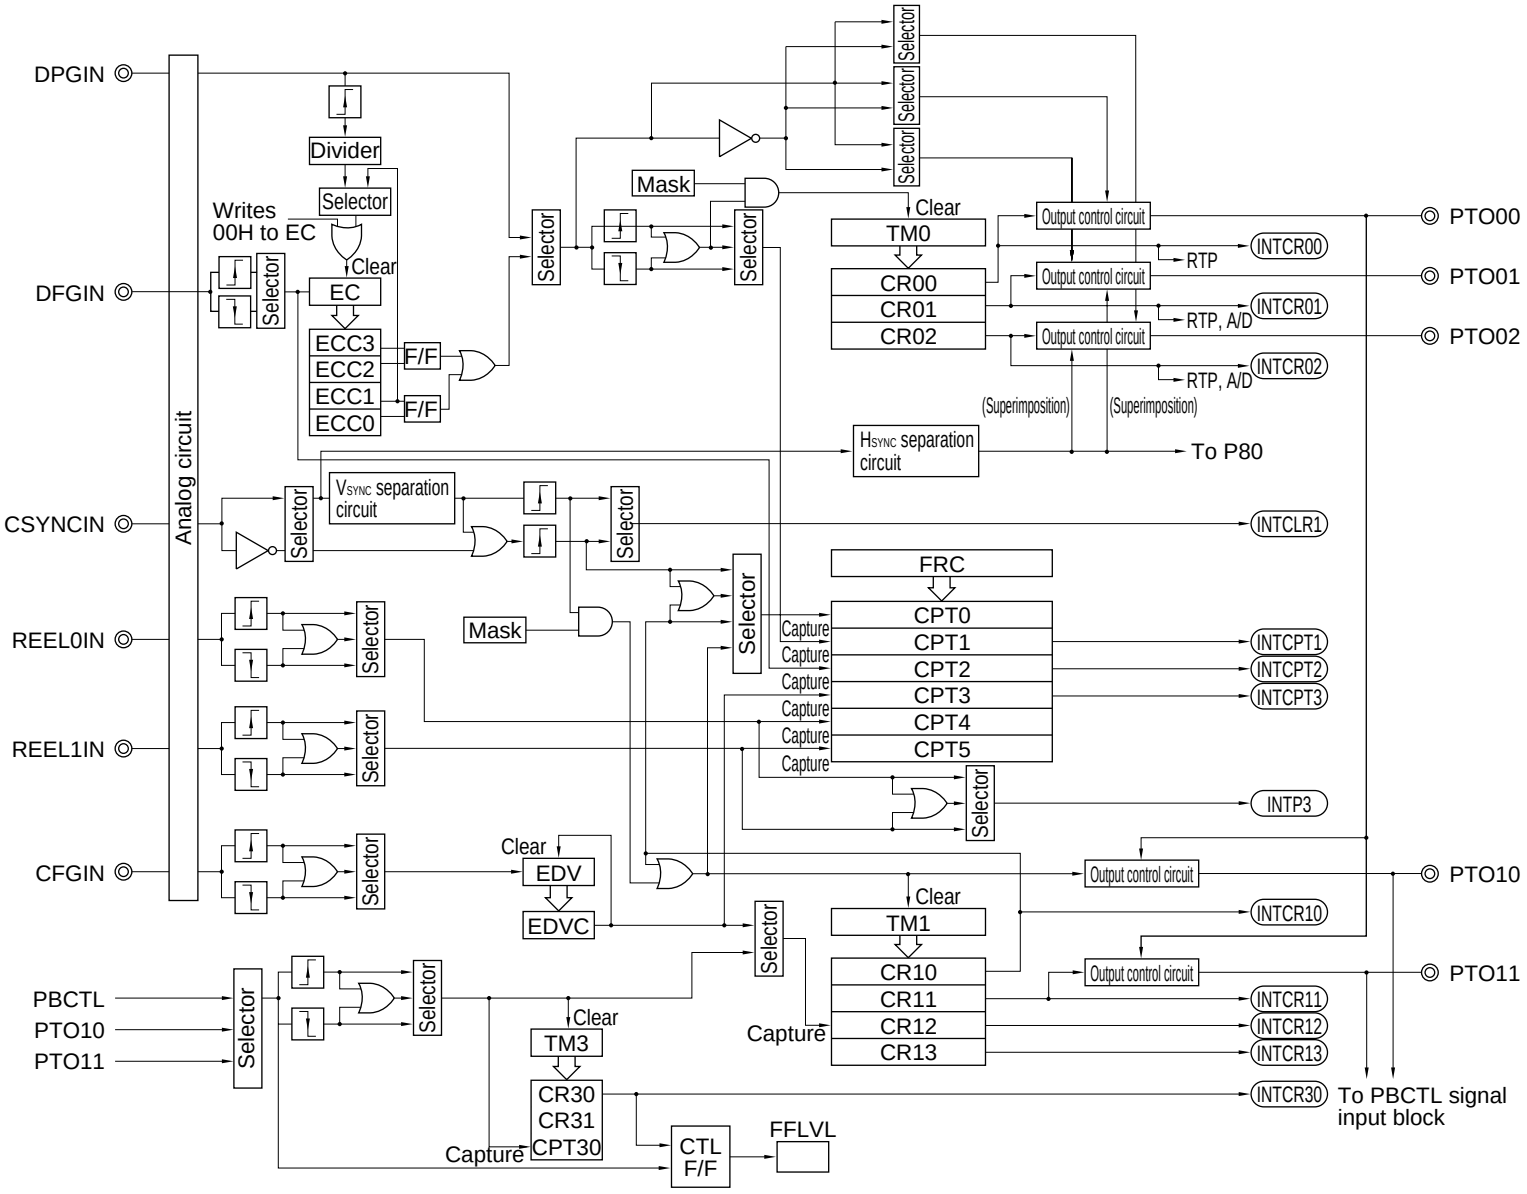
(3) Timer 1 unit

Timer 1 unit is a reference timer unit synchronized with the frame cycle and creates the RECCTL signal, detects the phase of the capstan motor, and detects the duty factor of the PBCTL signal. This unit consists of the following three groups:

- Timer 1 (TM1), compare registers (CR10, CR11, and CR13), and capture register (CR12)
- Timer 3 (TM3), compare registers (CR30 and CR31), and capture register (CPT30)
- Event divider counter (EDV) and compare register (EDVC)

The TM1-CR13 coincidence signal can be used for automatic unmasking of V_{SYNC} or as the output trigger of the real-time output port.

Figure 3-10. Block Diagram of Super Timer Unit (TM0, FRC, TM1)



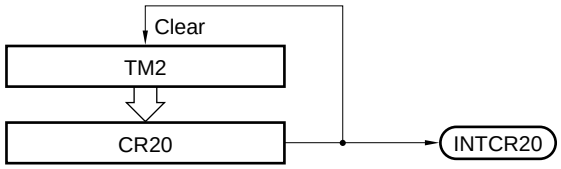
(4) Timer 2 unit

Timer 2 unit is a general-purpose 16-bit timer unit.

This unit consists of a timer (TM2) and a compare register (CR20).

The timer is cleared when the TM2-CR20 coincidence signal occurs, and at the same time, an interrupt request is generated.

Figure 3-11. Block Diagram of Timer 2 Unit



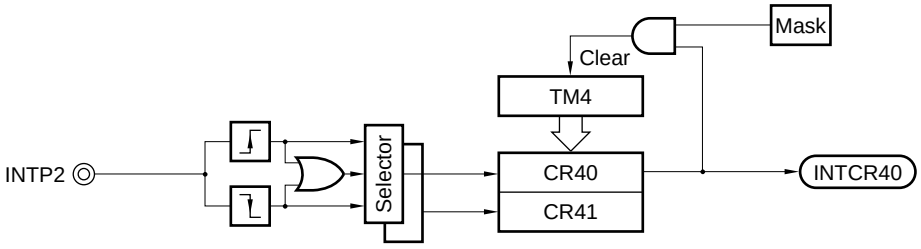
(5) Timer 4 unit

Timer 4 unit is a general-purpose 16-bit timer unit.

This unit consists of a timer (TM4), a capture/compare register (CR40), and a capture register (CR41).

The value of the timer is captured to CR40/CR41 when the INTP2 signal is input. This timer can be used to decode a remote controller signal.

Figure 3-12. Block Diagram of Timer 4 Unit



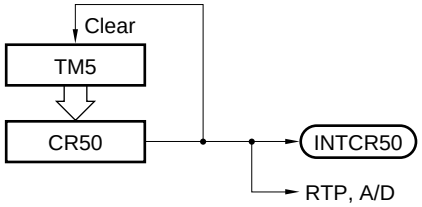
(6) Timer 5 unit

Timer 5 unit is a general-purpose 16-bit timer unit.

This unit consists of a timer (TM5) and a compare register (CR50).

The timer is cleared by the TM5-CR50 coincidence signal, and at the same time, an interrupt request is generated.

Figure 3-13. Block Diagram of Timer 5 Unit



(7) Up/down counter unit

The up/down counter unit is a counter that realizes a linear time counter.

This unit consists of an up/down counter (UDC) and a compare register (UDCC).

The up/down counter counts up the rising edges of PBCTL and counts down the falling edges of PBCTL. When the value of the up/down counter coincides with the value of the compare register, or when the counter underflows, an interrupt request is generated.

(8) PWM output unit

The PWM output unit has three 16-bit accuracy output lines (PWM0, PWM1, and PWM5) and 8-bit accuracy output lines (PWM2 through PWM4). The carrier frequency of all the output lines is 62.5 kHz (f_{CLK} = 8 MHz). PWM0 and PWM1 can be used to control the drum motor and capstan motor.

3.7 Serial Interface

The μPD784927 is provided with the serial interfaces shown in Table 3-6.

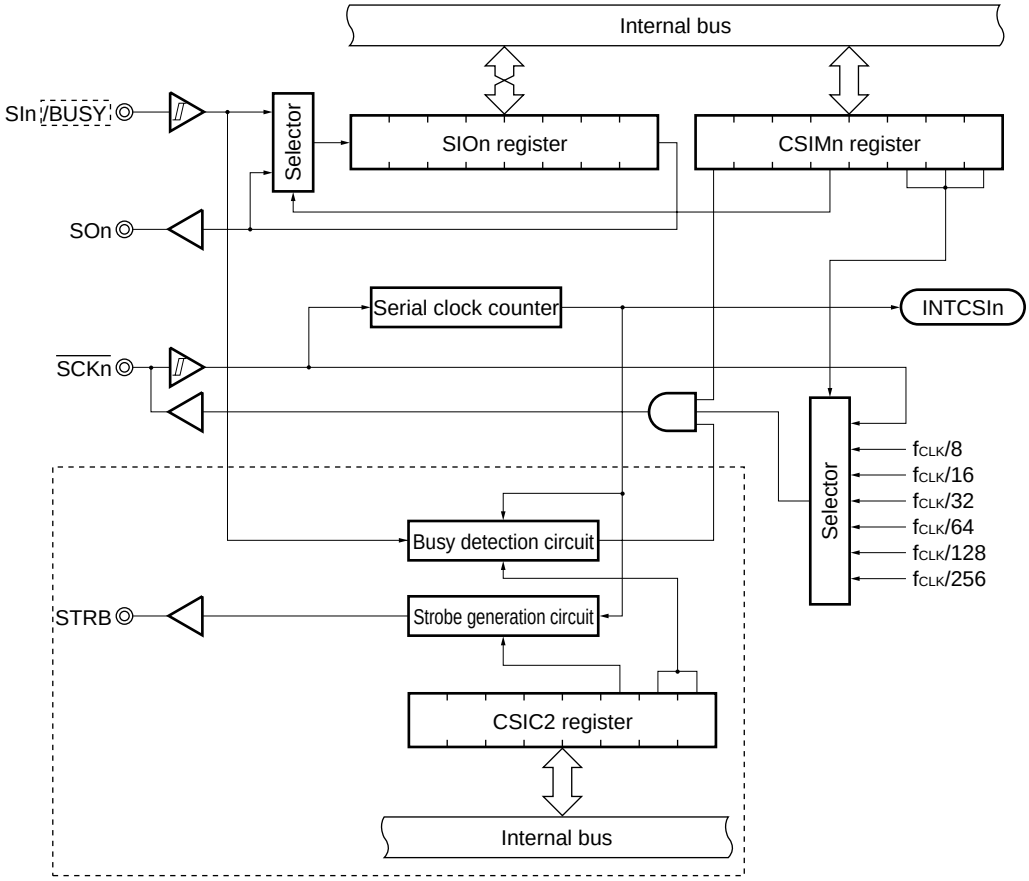
Data can be automatically transmitted or received through these serial interfaces, when the macro service is used.

Table 3-6. Types of Serial Interfaces

Name	Function
Serial interface channel 1	• Clocked serial interface (3-wire) • Bit length: 8 bits • Clock rate: External clock/31.25 kHz/62.5 kHz/125 kHz/250 kHz/500 kHz/1 MHz (f_{CLK} = 8 MHz) • MSB first/LSB first selectable
Serial interface channel 2	• Clocked serial interface (3-wire) • Bit length: 8 bits • Clock rate: External clock/31.25 kHz/62.5 kHz/125 kHz/250 kHz/500 kHz/1 MHz (f_{CLK} = 8 MHz) • MSB first/LSB first selectable • BUSY/STRB control function
Serial interface channel 3	• I^2C bus interface For multimaster

(1) Serial interface channels 1, 2

Figure 3-19. Block Diagram of Serial Interface Channel n (n = 1 or 2)



Remark The circuits enclosed in the broken line are provided to serial interface channel 2 only.

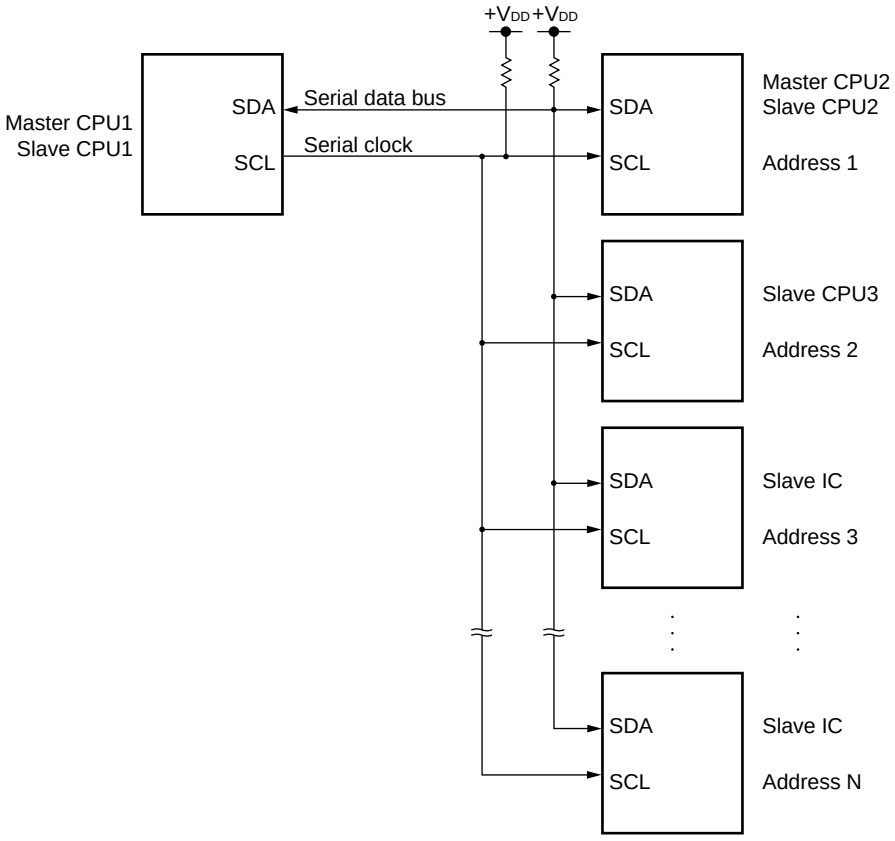
(2) Serial interface channel 3 (μPD784928Y subseries only)

This channel transfers 8-bit data with multiple devices using two lines: serial clock (SCL) and serial data bus (SDA).

It conforms to the I^2C bus format, and can output a “start condition”, “data”, and “stop condition” onto the serial data bus during transmission. This data is automatically detected by hardware during reception.

SCL and SDA are open-drain output pins and therefore, must be connected with a pull-up resistor.

Figure 3-20. Serial Interface Channel 3



3.8 A/D Converter

The μPD784927Y has an analog-to-digital (A/D) converter with 12 multiplexed analog inputs (ANI0 through ANI11).

This A/D converter is of successive approximation type, and the conversion result is held by an 8-bit A/D conversion result register (ADCR) (conversion time: 10 μs at f_{CLK} = 8 MHz).

A/D conversion can be started in the following two modes:

- Hardware start: Conversion is started by a hardware trigger[Note].
- Software start : Conversion is started by setting a bit of the A/D converter mode register (ADM).

After conversion has been started, the A/D converter operates in the following modes:

- Scan mode : Sequentially selects more than one analog input to obtain data to be converted from all the pins.
- Select mode: Use only one pin for analog input to obtain successive data to be converted.

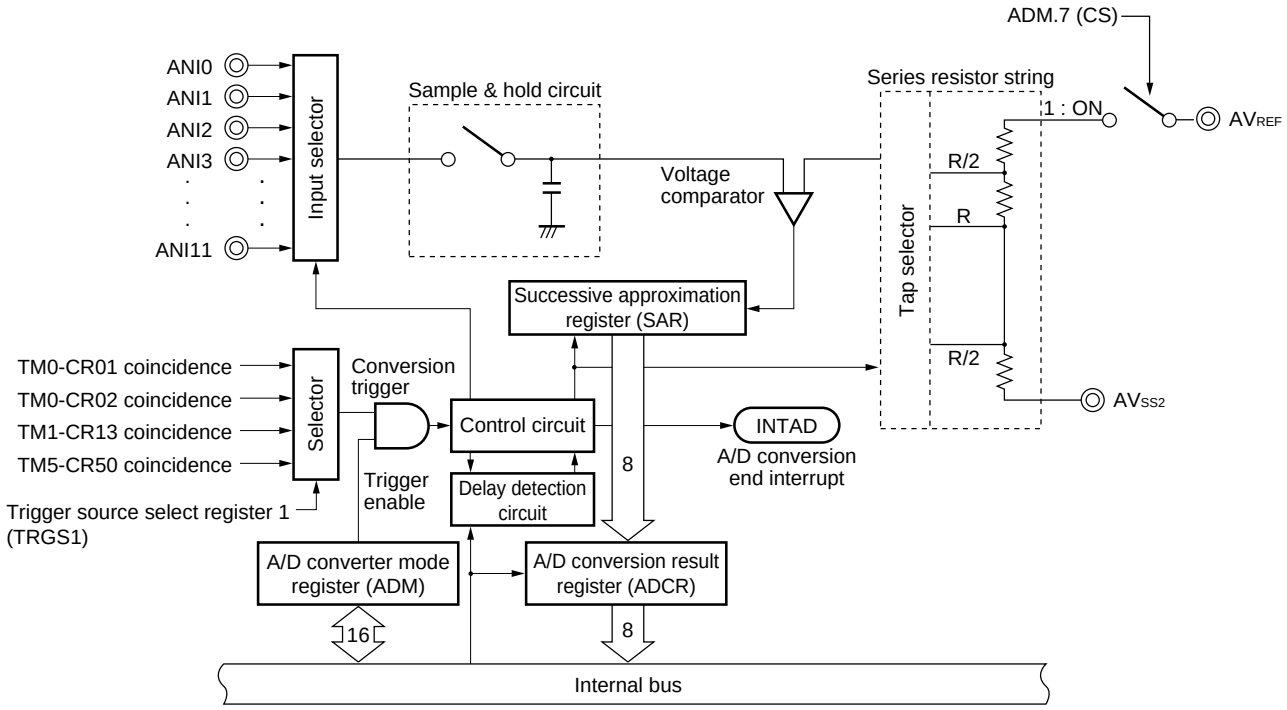
When the conversion result is transferred to ADCR, interrupt request INTAD is generated. By processing this interrupt with the macro service, the conversion result can be successively transferred to memory.

A mode in which starting A/D conversion of the next pin is kept pending until the value of ADCR is read is also available. When this ode is used, reading the conversion result by mistake when timing is shifted because an interrupt is disabled can be prevented.

Note A hardware trigger is the following coincidence signals, one of which is selected by the trigger source select register 1 (TRGS1):

- TM0-CR01 coincidence signal
- TM0-CR02 coincidence signal
- TM1-CR13 coincidence signal
- TM5-CR50 coincidence signal

Figure 3-21. Block Diagram of A/D Converter



3.9 VCR Analog Circuits

The μPD784927 is provided with the following VCR analog circuits:

- CTL amplifier
- RECCTL driver (rewritable)
- DPG amplifier
- DFG amplifier
- DPFG separation circuit (ternary separation circuit)
- CFG amplifier
- Reel FG comparator (2 channels)
- CSYNC comparator

(1) CTL amplifier/RECCTL driver

The CTL amplifier is used to amplify the playback control (PBCTL) signal that is reproduced from the CTL signal recorded on a VCR tape.

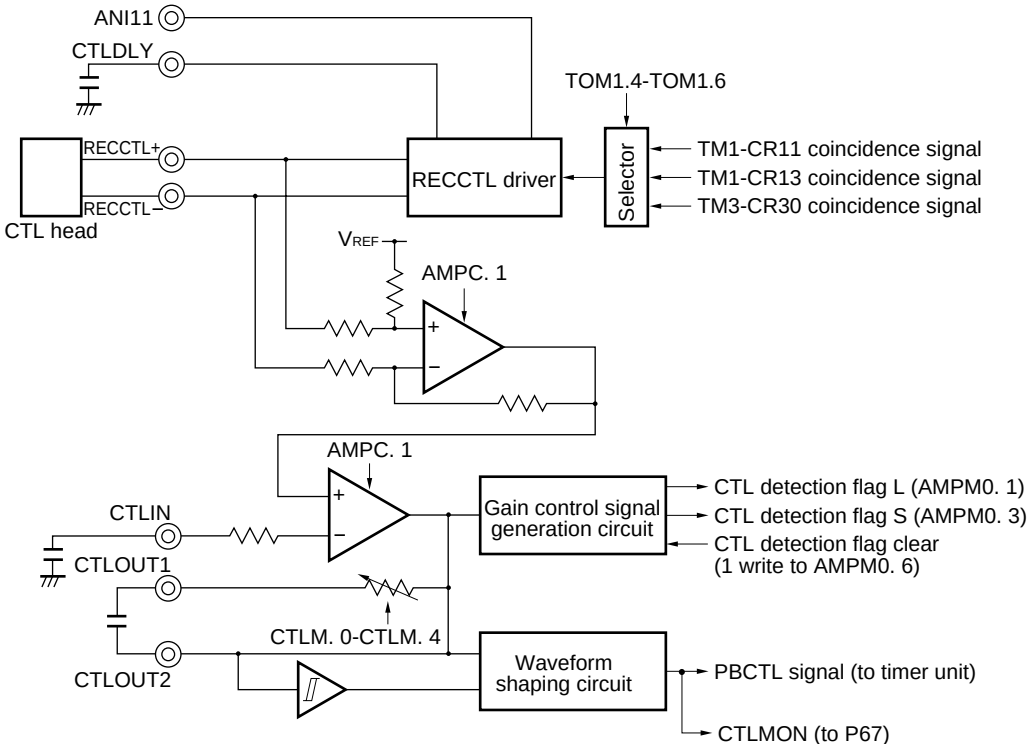
The gain of the CTL amplifier is set by the gain control register (CTLM). Thirty-two types of gains can be set in increments of about 1.78 dB.

The μPD784927 is also provided with a gain control signal generation circuit that monitors the status of the amplifier output to perform optimum gain control by software. The gain control signal generation circuit generates a CTL detection flag that identifies the amplitude status of the CTL amplifier output. By using this CTL detection flag, the gain of the CTL amplifier can be optimized.

The RECCTL driver writes a control signal onto a VCR tape.

This driver operates in two modes: REC mode that is used for recording, and rewrite mode used to rewrite the VISS signal. The output status of the RECCTL± pin is changed by hardware, by using the timer output from the super timer unit as a trigger.

Figure 3-22. Block Diagram of CTL Amplifier and RECCTL Driver



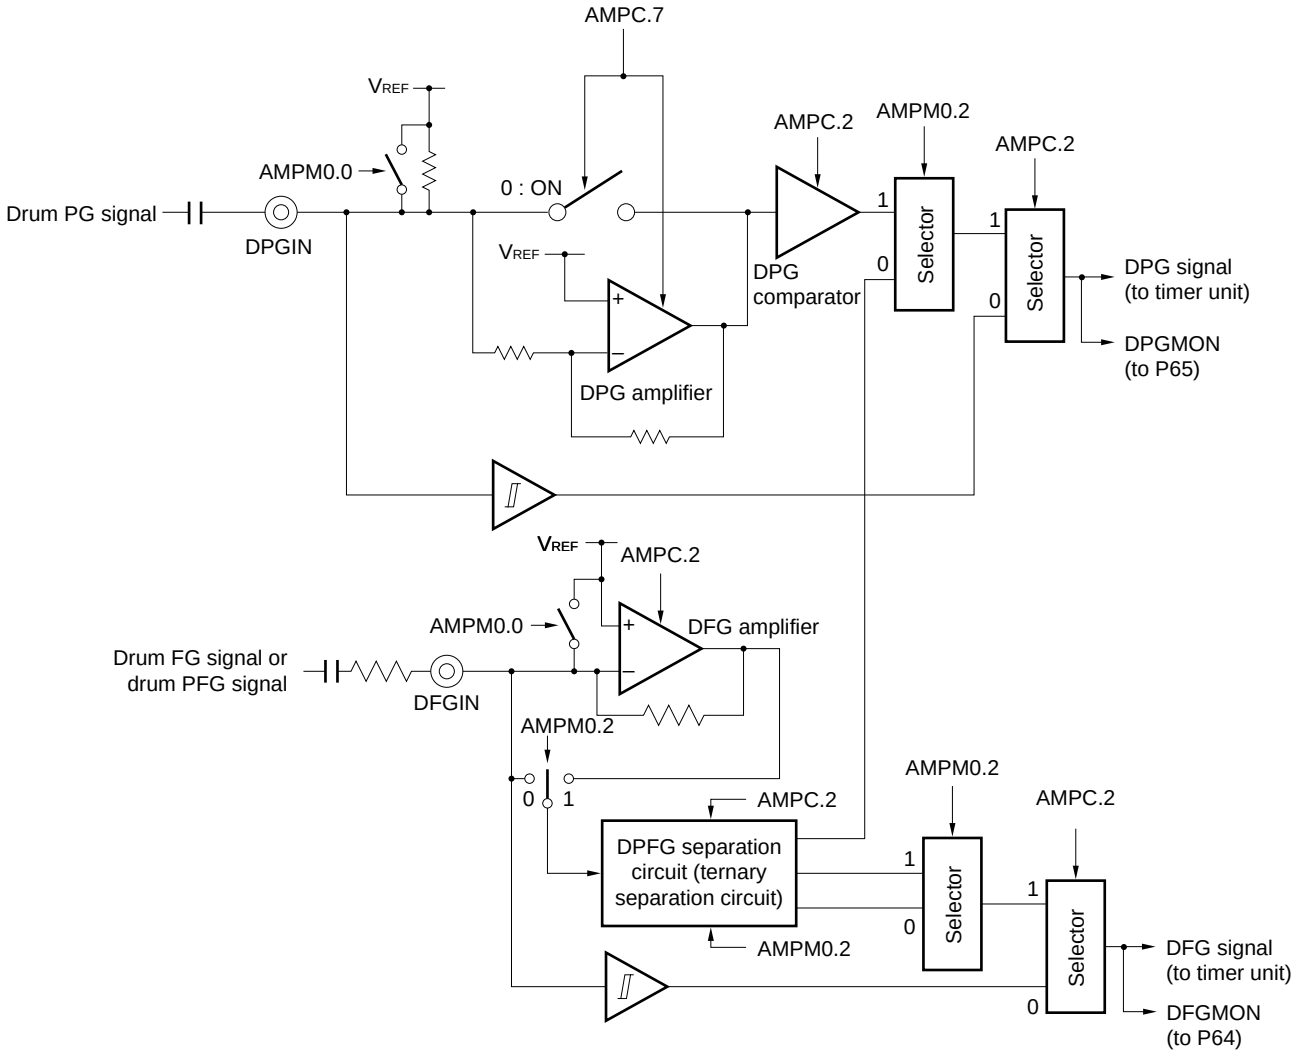
(2) DPG amplifier, DFG amplifier, and DFPG separation circuit

The DPG amplifier converts the drum PG (DPG) signal that indicates the phase information of the drum motor into a logic signal.

The DFG amplifier amplifies the drum FG (DFG) signal that indicates the speed information of the drum motor.

The DPFG separation circuit (ternary separation circuit) separates a drum PFG (DPFG) signal having speed and phase information into a DFG and DPG signals.

Figure 3-23. Block Diagram of DPG Amplifier, DFG Amplifier, and DPFG Separation Circuit

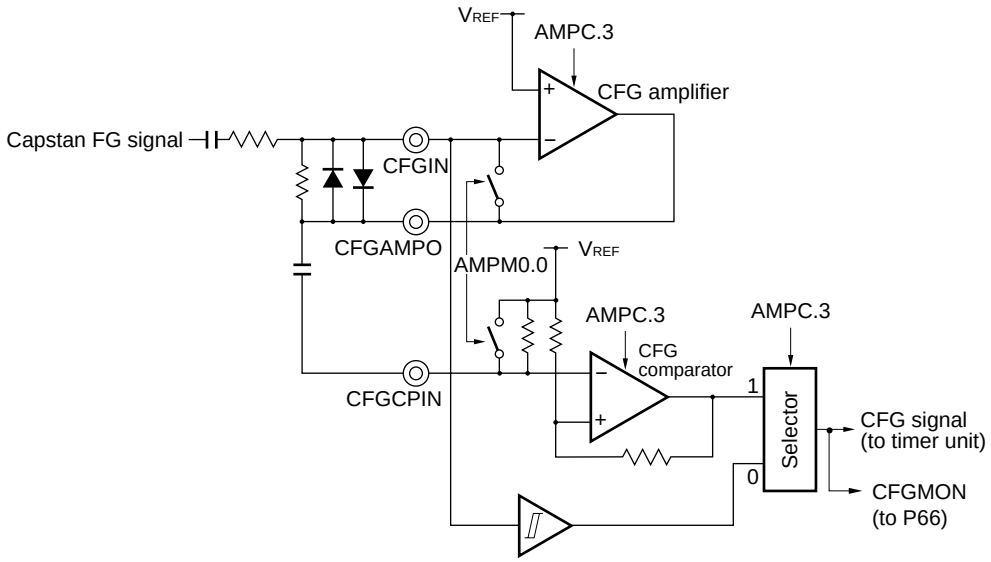


(3) CFG amplifier

The CFG amplifier amplifies the capstan FG (CFG) signal that indicates the speed information of the capstan motor. This amplifier consists of an operational amplifier and a comparator. The gain of the operational amplifier is set by using an external resistor.

When the gain of the operational amplifier is set to 50 dB, the output duty accuracy of the CFG signal can be improved to 50.0 ± 0.3%.

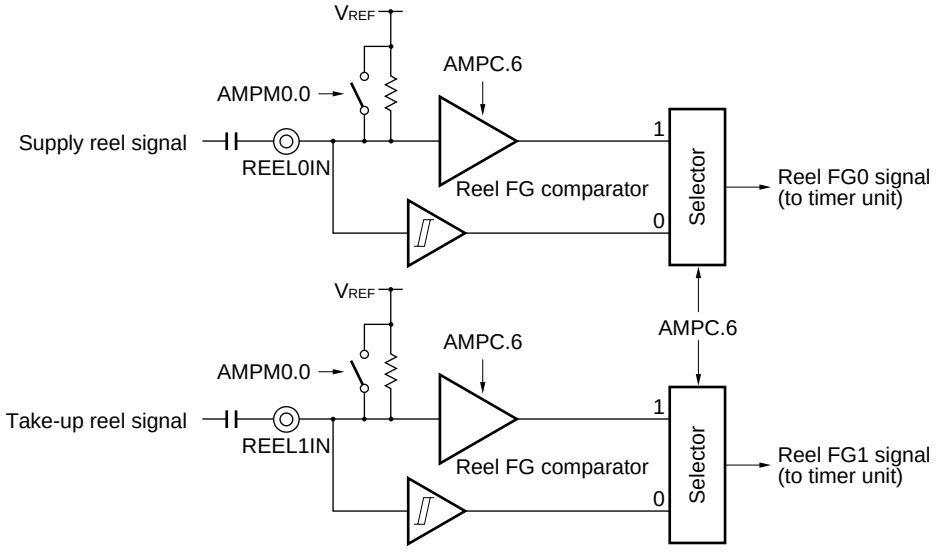
Figure 3-24. Block Diagram of CFG Amplifier



(4) Reel FG comparators

The reel FG comparator converts a reel FG signal that indicates the speed information of the reel motor into a logic signal. Two comparators, one for take-up and the other for supply, are provided.

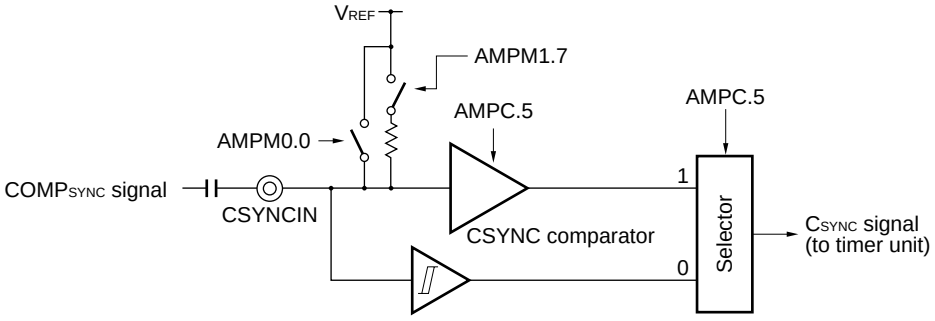
Figure 3-25. Block Diagram of Reel FG Comparators



(5) CSYNC comparator

The CSYNC comparator converts the COMPSYNC signal into a logic signal.

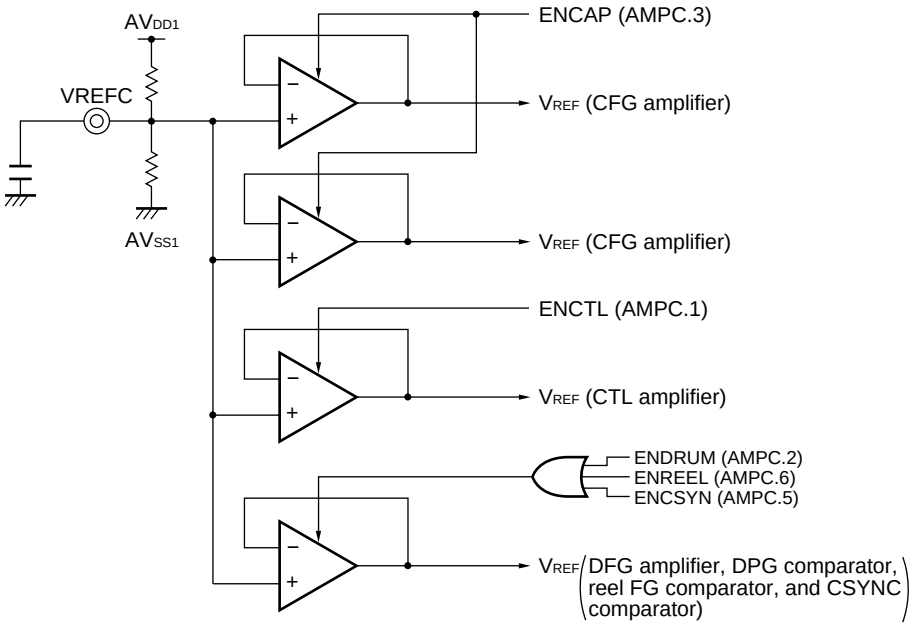
Figure 3-26. Block Diagram of COMPSYNC Comparator



(6) Reference amplifier

The reference amplifier generates a reference voltage (V_{REF}) to be supplied to the internal amplifiers and comparators of the μPD784927.

Figure 3-27. Block Diagram of Reference Amplifier



Remark Multiple reference amplifiers are provided to assure the accuracy of the amplifiers and comparators.

(7) Analog circuit monitor function

This function is to output the following signals to port pins, and is mainly used for debugging.

- Comparator output of CTL amplifier → CTLMON (multiplexed port: P67)
- Comparator output of CFG amplifier → CFGMON (multiplexed port: P66)
- Comparator output of DPG amplifier → DPGMON (multiplexed port: P65)
- Comparator output of DFG amplifier → DFGMON (multiplexed port: P64)

3.10 Watch Function

The μPD784927 has a watch function that counts the overflow signals of the watch timer by hardware. As the clock, the subsystem clock (32.768 kHz) is used.

Because this watch function is independent of the CPU, it can be used even while the CPU is in the standby mode (STOP mode) or is reset. In addition, this function can be used at a low voltage of V_{DD} = 2.7 V (MIN.).

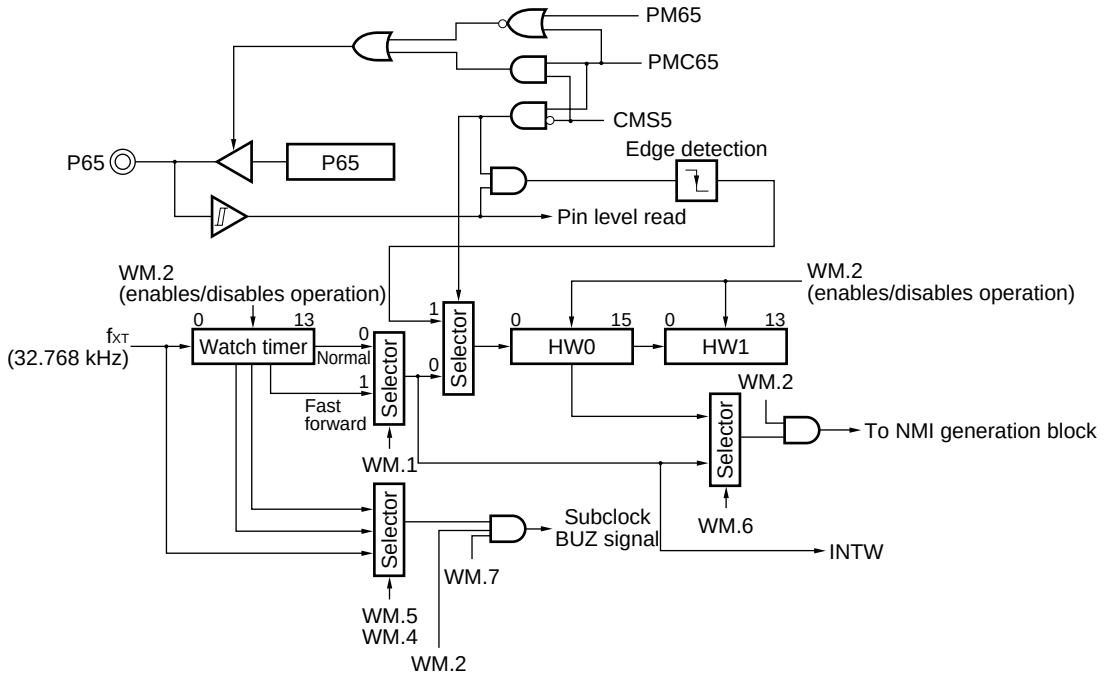
Therefore, by using only the watch function with the CPU set in the standby mode or reset, a watch operation can be performed at a low voltage and low current consumption.

In addition, the watch function can also be used while the CPU is in the normal operation mode, because a dedicated counter is provided.

The watch function can be used to count up to about 17 years of data.

The hardware watch counters (HW0 and HW1) are shared with external input counters. These counters execute counting at the falling edge of input to the P65 pin, and can be used to count the H_{SYNC} signals.

Figure 3-28. Block Diagram of Watch Counter



3.11 Clock Output Function

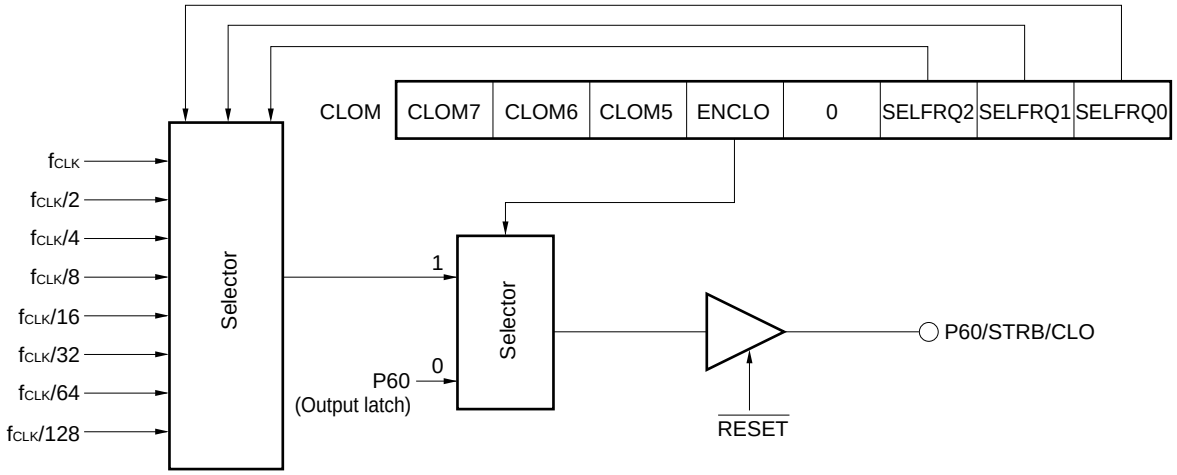
The μPD784927 can output a square wave (with a duty factor of 50%) to the P60/STRB/CLO pin as the operating clock for the peripheral devices or other microcomputers. To enable or disable the clock output, and to set the frequency of the clock, the clock output mode register (CLOM) is used.

When setting the frequency, the division ratio can be set to f_{CLK}/n (where n = 1, 2, 4, 8, 16, 32, 64, or 128) ($f_{CLK} = f_{OSC}/2$: f_{OSC} is the oscillation frequency of the resonator).

Figure 3-29 shows the block diagram of the clock output circuit.

The clock output (CLO) pin is shared with P60 and STRB.

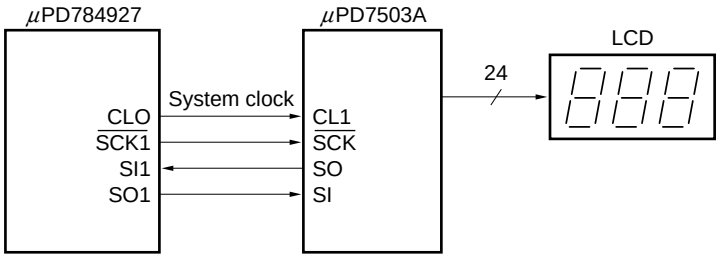
Figure 3-29. Block Diagram of Clock Output Circuit



Remark f_{CLK}: internal system clock

Caution Do not use the clock output function in the STOP mode. Clear ENCLO (CLOM.4) to 0 in the STOP mode.

Figure 3-30. Application Example of Clock Output Function



3.12 Buzzer Output Function

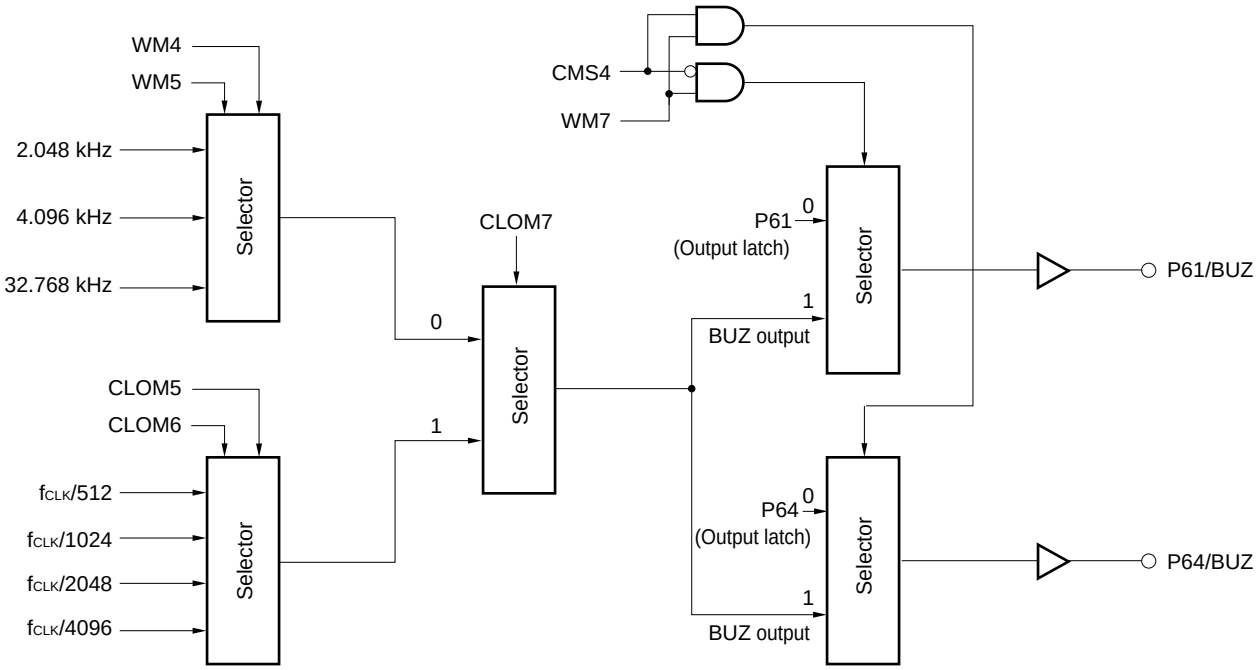
The BUZ signal can be superimposed on P61 or P64.

The buzzer output frequency can be generated from the subsystem clock frequency or main system clock frequency.

Figure 3-31 shows the block diagram of the BUZ output circuit.

The BUZ signal can be also used for trimming the subsystem clock.

Figure 3-31. Block Diagram of BUZ Output Circuit



4. INTERNAL/EXTERNAL CONTROL FUNCTION

4.1 Interrupt Function

The μPD784927 has as many as 32 interrupt sources, including internal and external sources. For 28 sources, a high-speed interrupt processing mode such as context switching or macro service can be specified by software.

Table 4-1 lists the interrupt sources.

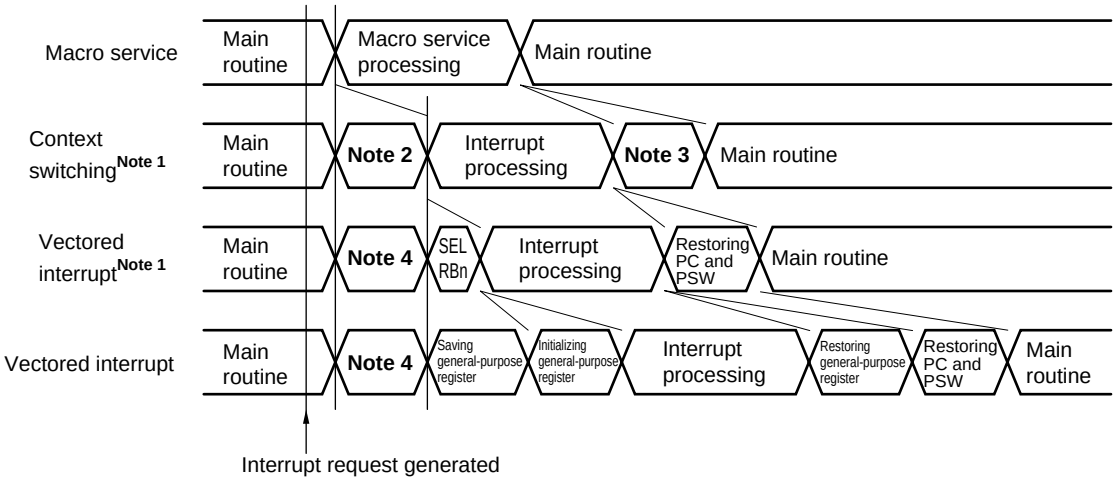
Figure 4-1. Differences in Operation Depending on Interrupt Processing Mode



Notes 1. When the register bank switching function is used and when initial values are set in advance to the registers

2. Selecting a register bank and saving PC and PSW by context switching

3. Restoring register bank, PC, and PSW by context switching

4. Saves PC and PSW to stack and loads vector address to PC

4.1.1 Vectored interrupt

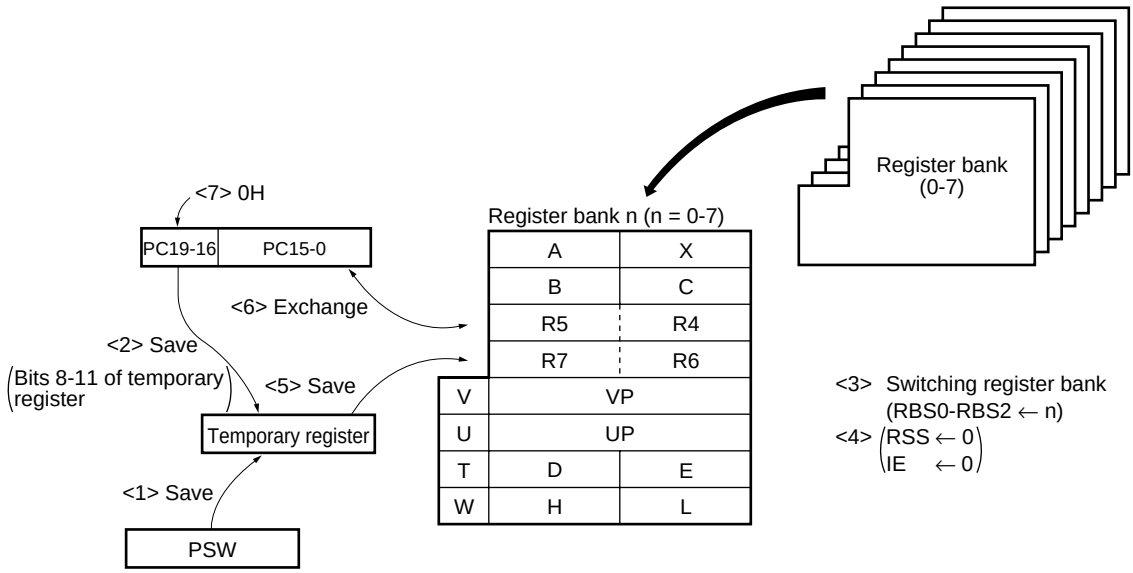
When an interrupt request is acknowledged, an interrupt processing program is executed according to the data stored in the vector table area (the first address of the interrupt processing program created by the user).

In addition, four levels of priorities can be specified by software.

4.1.2 Context switching

When an interrupt request is generated or when the BRKCS instruction is executed, a specific register bank is selected by hardware, and execution branches to a vector address set in advance in the register bank. At the same time, the current contents of the program counter (PC) and program status word (PSW) are saved to the registers in the register bank. Because the contents of PC and PSW are not saved to the stack area, execution can be branched to an interrupt processing routine more quickly than the vectored interrupt.

Figure 4-2. Context Switching Operation When Interrupt Request Is Generated



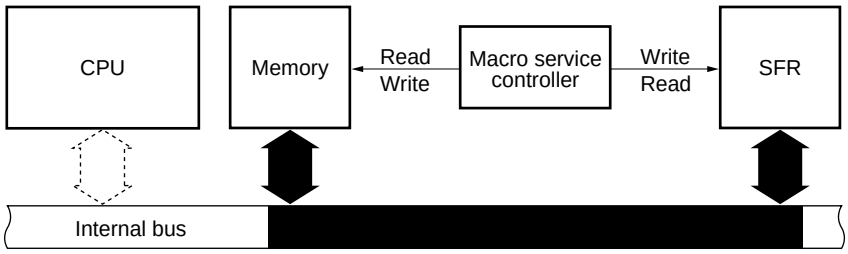
4.1.3 Macro service

The macro service is a function to transfer data between the memory and a special function register (SFR) without intervention by the CPU. A macro service controller accesses the memory and SFR and directly transfers the data.

Because the status of the CPU is not saved or restored, data can be transferred more quickly than context switching.

The processing that can be executed with the macro service is described below.

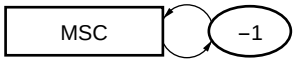
Figure 4-3. Macro Service



(1) Counter mode

In this mode, the value of the macro service counter (MSC) is decremented when an interrupt request occurs. This mode can be used to execute the division operation of an interrupt request or count the number of times an interrupt request has occurred.

When the value of the macro service counter has been decremented to 0, a vectored interrupt occurs.



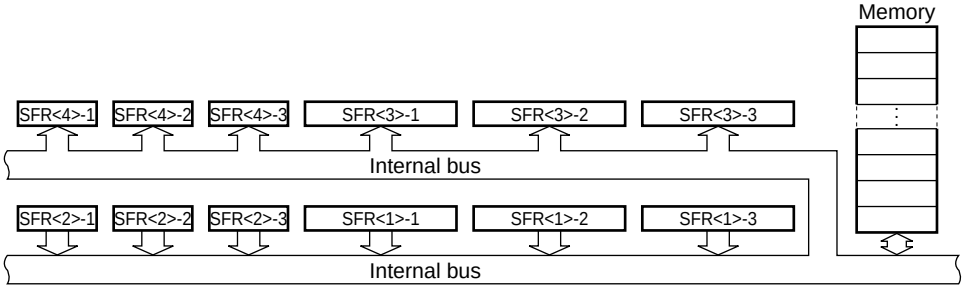
(2) Compound data transfer mode

When an interrupt request occurs, data are simultaneously transferred from an 8-bit SFR to memory, a 16-bit SFR to memory (word), memory (byte) to an 8-bit SFR, and memory (word) to a 16-bit SFR (3 points MAX. for each transfer).

This mode can also be used to exchange data, instead of transferring data.

This mode can be used for automatic transfer/reception by the serial interface or automatic updating of data/timing by the serial output port.

When the value of the macro service counter reaches to 0, a vectored interrupt request occurs.



(3) Macro service type A

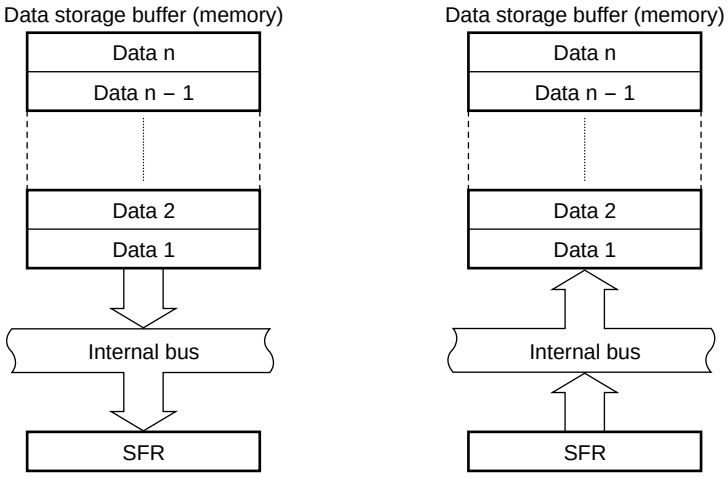
When an interrupt request occurs, data is transferred from an 8-/16-bit SFR to memory (byte/word) or from memory (byte/word) to an 8-/16-bit SFR.

Data is transferred the number of times set in advance by the macro service counter.

This mode can be used to store the result of A/D conversion or for automatic transfer (or reception) by the serial interface.

Because transfer data is stored at an address FE00H to FEFFH, if only a small quantity of data is to be transferred, the data can be transferred at high speeds.

When the value of the macro service counter is decremented to 0, a vectored interrupt request occurs.

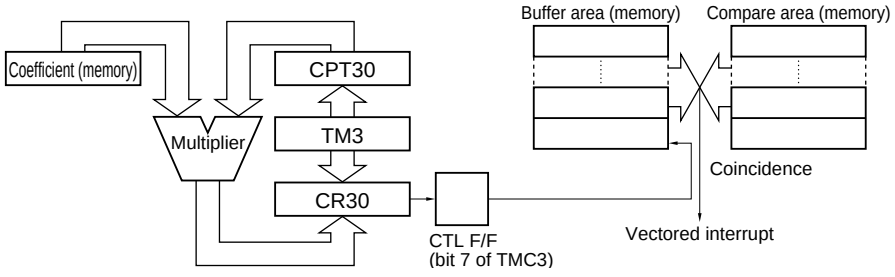


(4) Data pattern identification mode (VISS detection mode)

This mode of macro service is for detection of the VISS signal and is used in combination with a pulse width detection circuit.

When an interrupt request occurs, the content of bit 7 of an SFR (usually, TMC3) specified by SFR pointer 1 is shifted into the buffer area. At the same time, the data in the buffer area is compared with the data in the compare area. If the two data coincide, a vectored interrupt request is generated. When the value of the macro service counter is decremented to 0, a vectored interrupt request occurs.

It can be specified by option that the value of an SFR (usually, CPT30) specified by SFR pointer 2 be multiplied by a coefficient and the result of this multiplication be stored to an SFR (usually, CR30) specified by SFR pointer 3 (this operation is to automatically update an identification threshold value when the tape speed fluctuates).

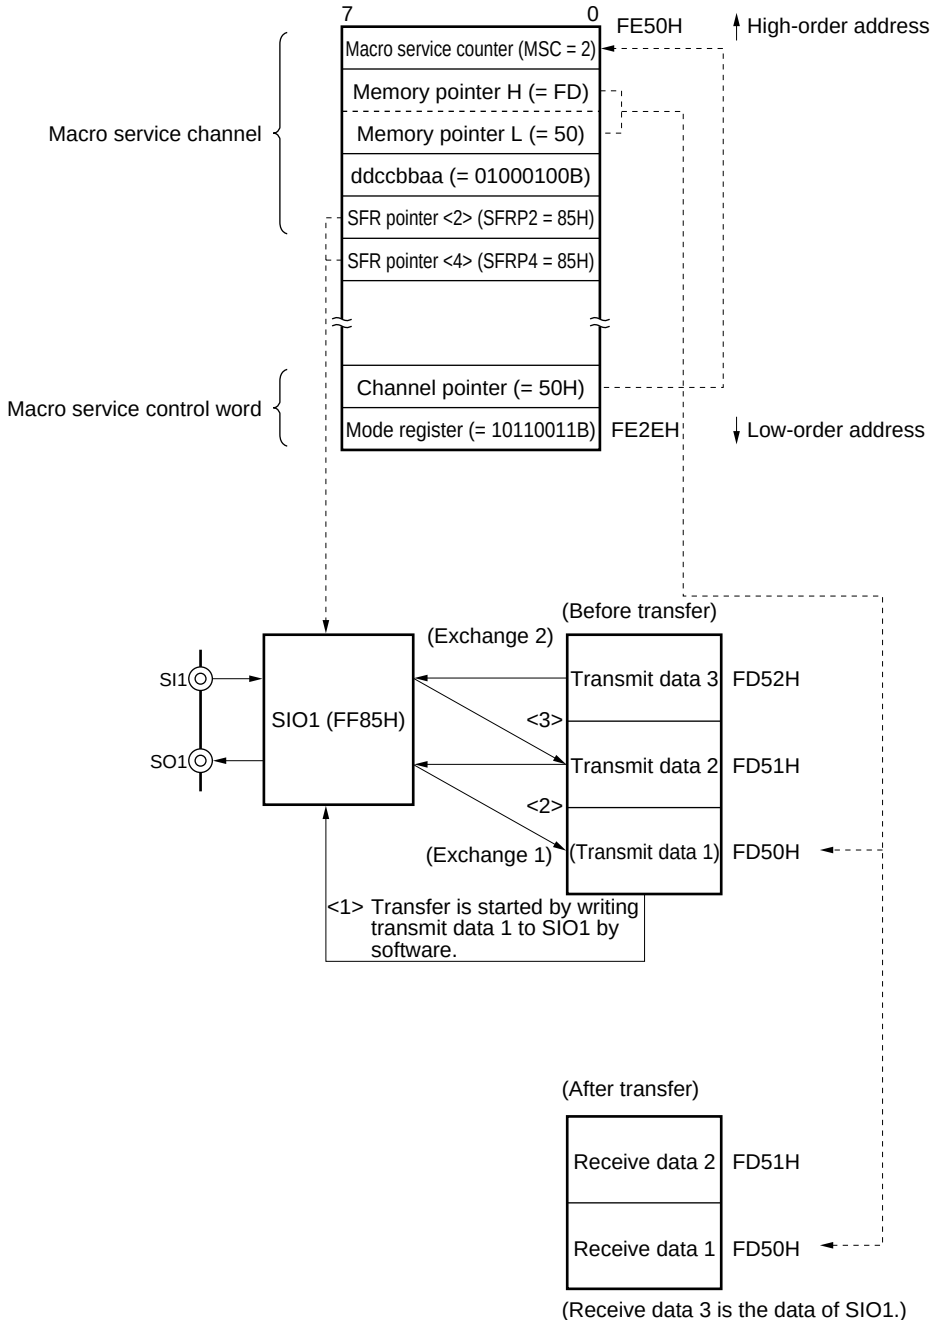


4.1.4 Application example of macro service

(1) Automatic transfer/reception of serial interface

Automatic transfer/reception of 3-byte data by serial interface channel 1

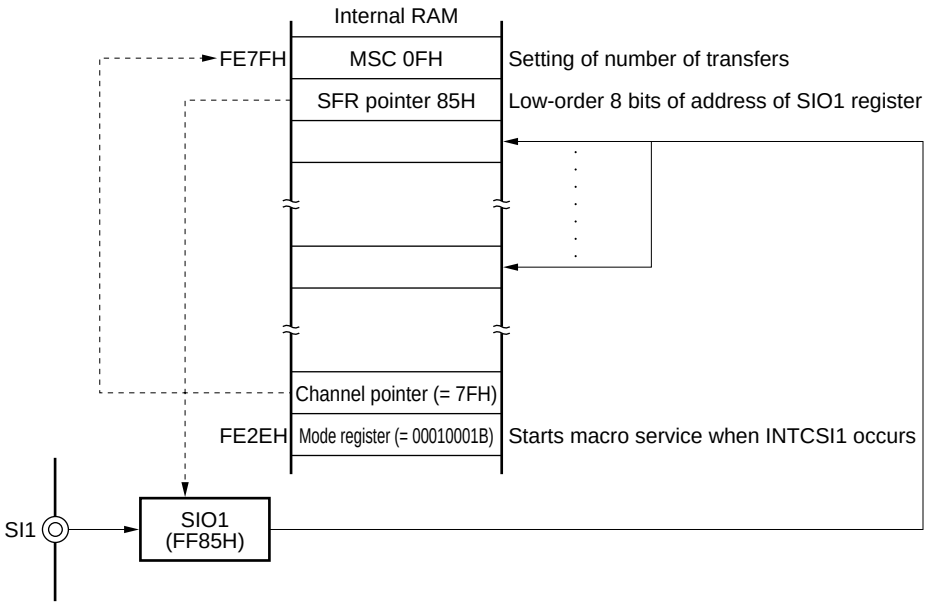
Setting of macro service register: compound data transfer mode (exchange mode)



(2) Reception operation of serial interface

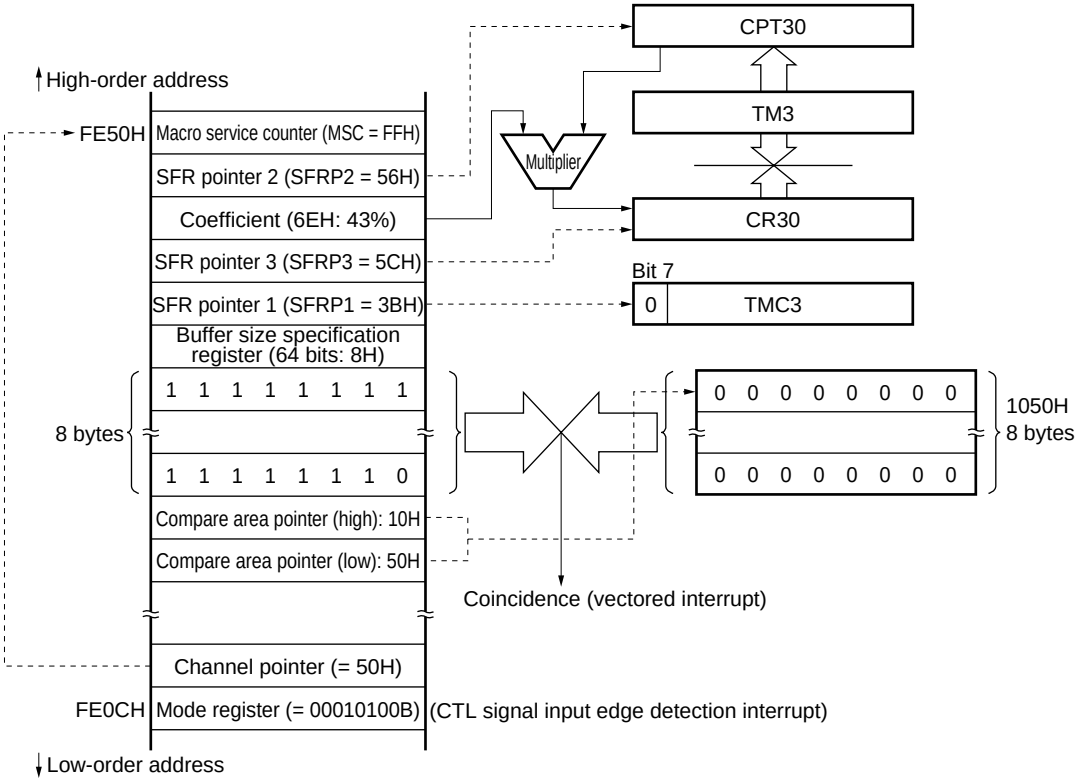
Transfer of receive data by serial interface channel 1 (16 bytes)

Setting of macro service mode register: macro service type A (1-byte data transfer from SFR to memory)



(3) VISS detection operation

Setting of macro service mode register: data pattern identification mode (with multiplication, 8-byte comparison)



4.2 Standby Function

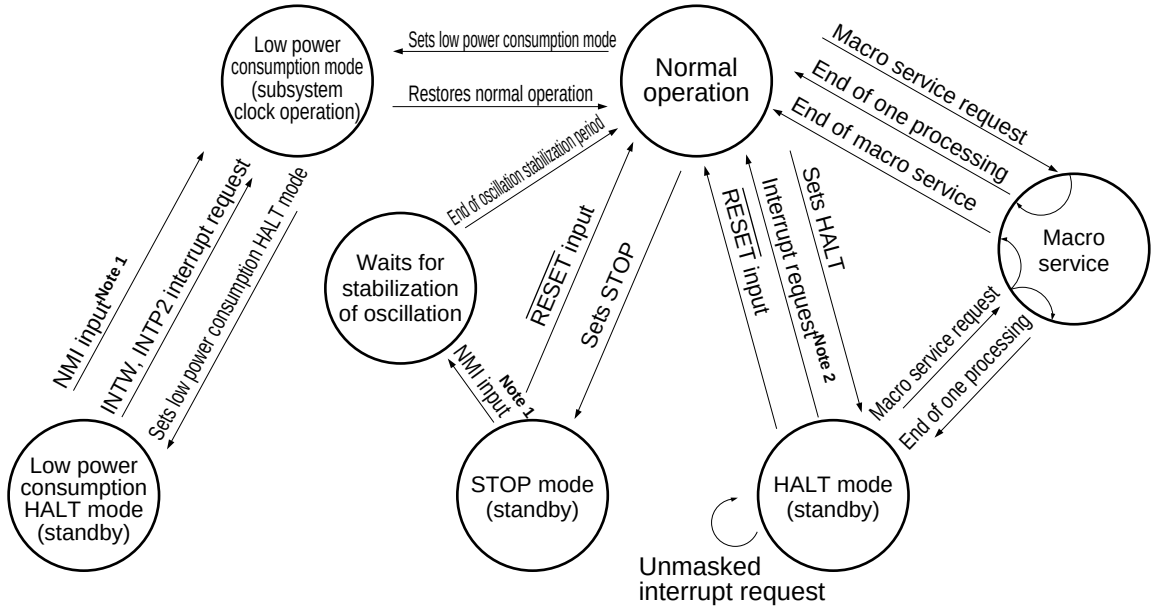
The standby function is to reduce the power consumption of the chip and is used in the following modes:

Mode	Function
HALT mode	Stops operating clock of CPU. Reduces average power consumption when used in combination with normal mode for intermittent operation
STOP mode	Stops oscillator. Stops all internal operations of chip to minimize power consumption to leakage current only
Low power consumption mode	Stops main system clock with subsystem clock used as system clock. CPU can operate with subsystem clock to reduce current consumption
Low power consumption HALT mode	Standby function in low power consumption mode. Stops operating clock of CPU. Reduces power consumption of overall system

These modes are programmable.

The macro service can be started in the HALT mode.

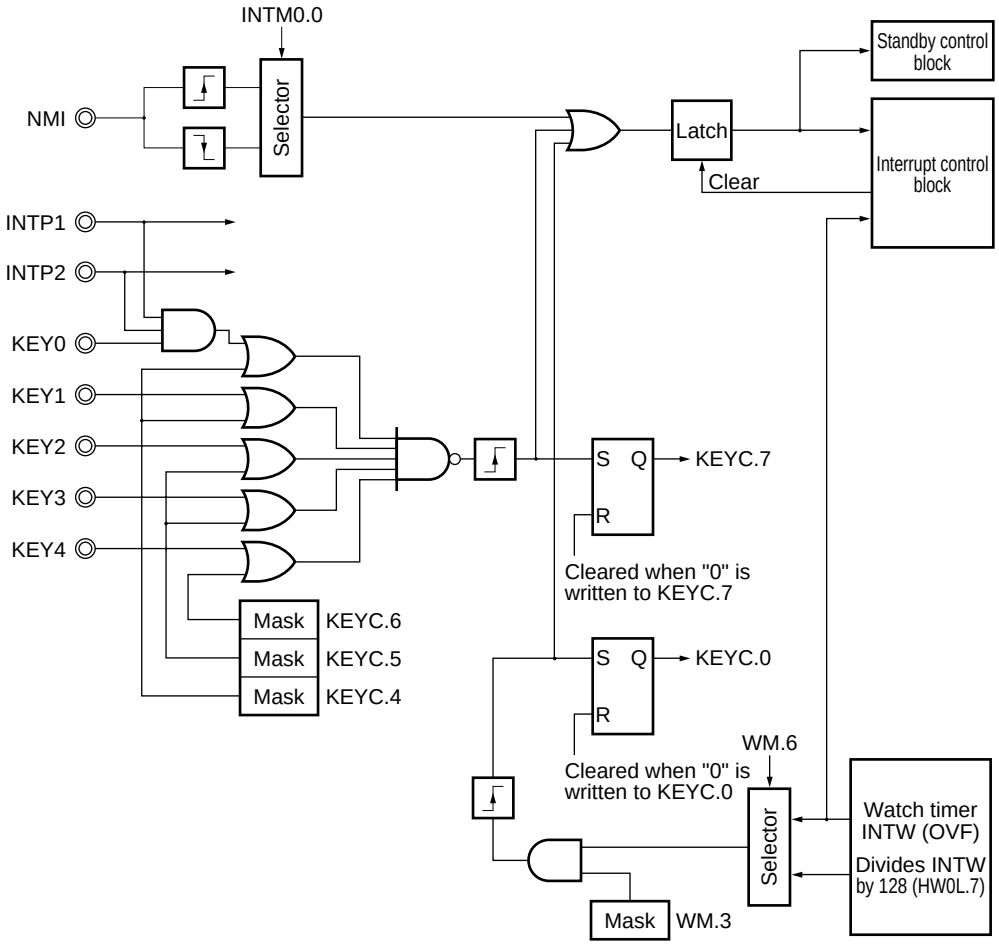
Figure 4-4. Status Transition of Standby Function



Notes 1. NMI input means starting NMI by NMI pin input, watch interrupt, or key interrupt input.

2. Unmasked interrupt request

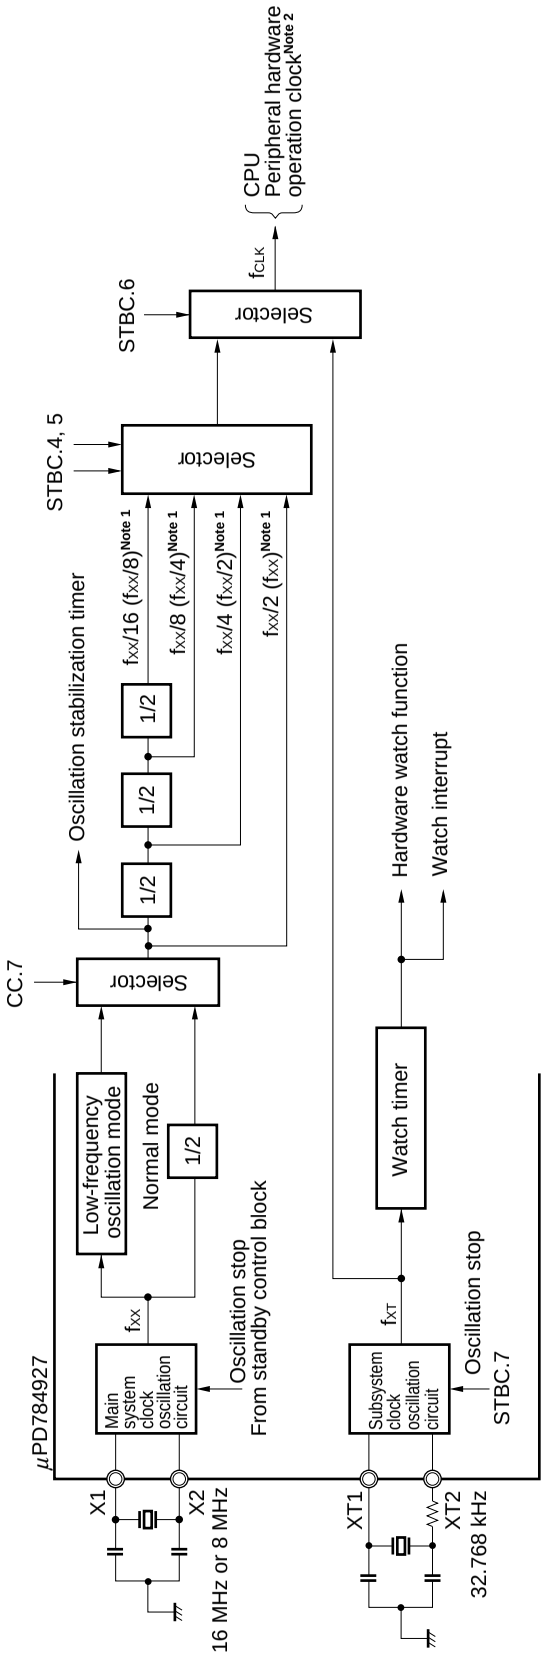
Figure 4-5. Relations among NMI, Watch Interrupt, and Key Interrupt When STOP Mode Is Released



4.3 Clock Generation Circuit

The clock generation circuit generates and controls the internal system clock (CLK) to be supplied to the CPU and peripheral circuits. Figure 4-6 shows the configuration of this circuit.

Figure 4-6. Block Diagram of Clock Generation Circuit



Notes 1. fXX: oscillation frequency, ( ): in low-frequency oscillation mode.

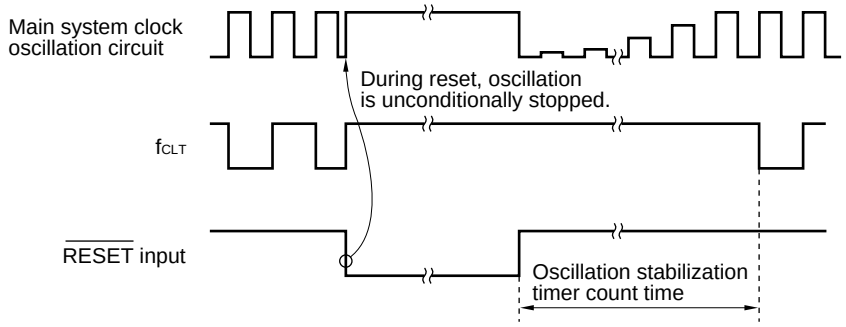
2. The peripheral hardware units that can operate with the subsystem clock have some restrictions. For details, refer to **μPD784928, 784928Y Subseries User's Manual-Hardware (U12648E)**.

4.4 Reset Function

When a low-level signal is input to the $\overline{\text{RESET}}$ pin, the system is reset, and each hardware unit is initialized (reset status). During the reset period, oscillation of the system clock is unconditionally stopped, so that the current consumption of the overall system can be reduced.

When the $\overline{\text{RESET}}$ pin goes high, the reset status is cleared. After the count time of the oscillation stabilization timer (32.8 ms at 16 MHz or 65.6 ms at 8 MHz) has elapsed, the contents of the reset vector table are set to the program counter (PC), and execution branches to the address set to the PC, and the program is executed starting from the branch destination address. Therefore, execution can be reset and started from any address.

Figure 4-7. Oscillation of Main System Clock during Reset Period



The $\overline{\text{RESET}}$ pin is provided with an analog delay noise rejection circuit to prevent malfunctioning due to noise.

Caution If the rated value of even one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings therefore specify the values exceeding which the product may be physically damaged. Never exceed these values when using the product.

Operating Conditions

Clock Frequency	Operating Ambient Temperature (T_A)	Operating Conditions	Supply Voltage (V_{DD})
4 MHz ≤ f_{XX} ≤ 16 MHz	–10 to +70°C	All functions	+4.5 to +5.5 V
		CPU function only	+4.0 to +5.5 V
32 kHz ≤ f_{XT} ≤ 35 kHz		Subclock operation (CPU, watch, and port functions only)	+2.7 to +5.5 V

Oscillator Characteristics (main clock) (T_A = –10 to +70°C, V_{DD} = AV_{DD} = 4.0 to 5.5 V, V_{SS} = AV_{SS} = 0 V)

Resonator	Recommended Circuit	Parameter	MIN.	MAX.	Unit
Crystal resonator		Oscillation frequency (f_{XX})	4	16	MHz

Oscillator Characteristics (subclock) (T_A = –10 to +70°C, V_{DD} = AV_{DD} = 2.7 to 5.5 V, V_{SS} = AV_{SS} = 0 V)

Resonator	Recommended Circuit	Parameter	MIN.	MAX.	Unit
Crystal resonator		Oscillation frequency (f_{XT})	32	35	kHz

Caution When using the main system clock and subsystem clock oscillator, wire the portion enclosed by the broken line in the above figures as follows to avoid the adverse influence of wiring capacitance:

- **Keep the wiring length as short as possible.**
- **Do not cross the wiring with the other signal lines. Do not route the wiring in the neighborhood of a signal line through which a high alternating current flows.**
- **Always keep the ground point of the capacitor of the oscillator to the same potential as V_{SS}. Do not ground the capacitor to a ground pattern to which a high current flows.**
- **Do not extract signals from the oscillation circuit.**

Exercise particular care in using the subsystem clock oscillator because the amplification factor of this circuit is kept low to reduce the current consumption.

Remark For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

Pulse width of spike restrained by input filter		t_{SP}	–	–	0	50	ns
Each bus line capacitative load		Cb	–	400	–	400	pF

Notes 1. The first clock pulse is generated at the start condition after this period.

2. The device needs to internally supply a hold time of at least 300 ns for the SDA signal to fill the undefined area at the falling edge of the SCL ($V_{IHmin.}$ of the SCL signal).

3. Unless the device extends the low hold time (t_{LOW}) of the SCL signal, it is necessary to fill only the maximum data hold time ($t_{HD:DAT}$).

4. The high-speed mode I²C bus can be used in the standard mode I²C bus system. In this case, satisfy the following conditions:

- When the device does not extend the low hold time of the SCL signal
  $t_{SU:DAT} \geq 250$ ns
- When the device extends the low hold time of the SCL signal
  Send the next data bit to the SDA line before releasing the SCL line ($t_{Rmax.} + t_{SU:DAT} = 1000 + 250 = 1250$ ns : in the standard mode I²C bus specification)

5. Cb: Total capacitance of one bus line (unit: pF)

8. RECOMMENDED SOLDERING CONDITIONS

Solder this product under the following recommended conditions.

For details of the recommended soldering conditions, refer to information document **Semiconductor Device Mounting Technology Manual (C10535E)**.

For soldering methods and conditions other than those recommended, consult NEC.

Caution μPD784927GC-×××-8EU, 784927YGC-×××-8EU, 784928GC-×××-8EU, and 784928YGC-×××-8EU are under development. Therefore their soldering conditions are not defined.

Partial heating	Pin temperature: 300°C max., Time: three secs. max. (per device side)	—

Caution Do not use two or more soldering methods in combination (except partial heating).

APPENDIX A. DEVELOPMENT TOOLS

The following development tools are available for developing systems using the μPD784927.
Refer to **(5) Cautions when the development tools are used.**

(1) Language processing software

RA78K4	78K/IV series common assembler package
CC78K4	78K/IV series common C compiler package
DF784928	Device file for the μPD784928, 784928Y subseries
CC78K4-L	78K/IV series common C compiler library source file

(2) Flash memory writing tools

Flashpro II, III (Part number: FL-PR2, FL-PR3, PG-FPIII)	Dedicated flash programmer
FA-100GC	Adapter for writing 100-pin plastic LQFP (GC-8EU type) flash memory. Be sure to connect depending on the target product.
FA-100GF	Adapter for writing 100-pin plastic QFP (GF-3BA type) flash memory. Be sure to connect depending on the target product.

(3) Debugging tools

- **When using the IE-78K4-NS in-circuit emulator**

IE-78K4-NS	78K/IV series common in-circuit emulator
IE-70000-MC-PS-B	Power supply unit for IE-78K4-NS
IE-70000-98-IF-C	Interface adapter necessary when a PC-9800 series computer (except notebook personal computer) is used as host machine (C bus compatible)
★ IE-70000-CD-IF-A	PC card and interface cable necessary when a notebook personal computer is used as host machine (PCMCIA socket compatible)
IE-70000-PC-IF-C	Interface adapter necessary when an IBM PC/AT™ compatible machine is used as host machine (ISA bus compatible)
IE-784928-NS-EM1	Emulation board for emulating the μPD784928, 784928Y subseries
EP-784915-GF-R	Emulation probe for μPD784915 subseries common 100-pin plastic QFP (GC-3BA type) and 100-pin plastic LQFP (GC-8EU type).
EV-9200GF-100	Conversion socket to be mounted on the board of the target system for 100-pin plastic QFP (GF-3BA type). It is used in LCC system.
NQPACK100RB	Conversion socket to be mounted on the board of the target system for 100-pin plastic QFP (GF-3BA type). It is used in QFP system.
ID78K4-NS	Integrated debugger for IE-78K4-NS
SM78K4	78K/IV series common system simulator
DF784928	Device file for the μPD784928, 784928Y subseries

- **When using the IE-784000-R in-circuit emulator**

IE-784000-R	78K/IV series common in-circuit emulator
IE-70000-98-IF-C	Interface adapter necessary when a PC-9800 series computer (except notebook personal computer) is used as host machine (C bus compatible)
IE-70000-PC-IF-C	Interface adapter necessary when an IBM PC/AT compatible machine is used as host machine (ISA bus compatible)
IE-78000-R-SV3	Interface adapter and cable necessary when an EWS is used as host machine
IE-784928-NS-EM1 IE-784915-R-EM1	Emulation board for emulating the μPD784928, 784928Y subseries and μPD784915 subseries
IE-784000-R-EM	78K/IV series common emulation board
IE-78K4-R-EX3	Conversion board for 100-pin products necessary when the IE-784928-NS-EM1 is used in the IE-784000-R. Not necessary when the IE-784915-R-EM1 is used.
EP-784915-GF-R	Emulation probe for μPD784915 subseries common 100-pin plastic QFP (GC-3BA type) and 100-pin plastic LQFP (GC-8EU type).
EV-9200GF-100	Conversion socket to be mounted on the board of the target system for 100-pin plastic QFP (GF-3BA type). It is used in LCC system.
NQPACK100RB	Conversion socket to be mounted on the board of the target system for 100-pin plastic QFP (GF-3BA type). It is used in QFP system.
ID78K4	Integrated debugger for IE-784000-R
SM78K4	78K/IV series common system simulator
DF784928	Device file for the μPD784928, 784928Y subseries

(4) Real-time OS

RX78K/IV	Real-time OS for 78K/IV series
MX78K4	OS for 78K/IV series

(5) Cautions when the development tools are used

- The ID78K4-NS, ID78K4, and SM78K4 are used in combination with the DF784928.
- The CC78K4 and RX78K/IV are used in combination with the RA78K4 and DF784928.
- FL-PR2, FL-PR3, FA-100GC, and FA-100GF are products of Naito Densei Machida Mfg. Co., Ltd. (TEL: 044-822-3813). Contact an NEC distributor when purchasing these products.
- NQPACK100RB is a product of Tokyo Eletech Corp.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Purchase of NEC I^2C components conveys a license under the Philips I^2C Patent Rights to use these components in an I^2C system, provided that the system conforms to the I^2C Standard Specification as defined by Philips.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

The export of this product from Japan is regulated by the Japanese government. To export this product may be prohibited without governmental license, the need for which must be judged by the customer. The export or re-export of this product from a country other than Japan may also be prohibited without a license from that country. Please call an NEC sales representative.

- **The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.**
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.
- NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.
- Descriptions of circuits, software, and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software, and information in the design of the customer's equipment shall be done under the full responsibility of the customer. NEC Corporation assumes no responsibility for any losses incurred by the customer or third parties arising from the use of these circuits, software, and information.
- While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.
- NEC devices are classified into the following three quality grades:
  "Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated “quality assurance program“ for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.
  - Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
  - Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
  - Specific: Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

  The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.
