

**16M-bit Synchronous DRAM****Description**

The  $\mu$ PD4516421, 4516821, 4516161 are high-speed 16,777,216-bit synchronous dynamic random-access memories, organized as 2,097,152 $\times$ 4 $\times$ 2, 1,048,576 $\times$ 8 $\times$ 2 and 524,288 $\times$ 16 $\times$ 2 (word $\times$ bit $\times$ bank), respectively.

The synchronous DRAMs achieve high-speed data transfer using the pipeline architecture.

All inputs and outputs are synchronized with the positive edge of the clock.

The synchronous DRAMs compatible with Low Voltage TTL (LVTTTL).

The synchronous DRAMs are packaged in 44-pin TSOP (II) ( $\times$ 4,  $\times$ 8) and 50-pin TSOP (II) ( $\times$ 16).

**Features**

- Fully Synchronous Dynamic RAM, with all signals referenced to a positive clock edge
- Pulsed interface
- Possible to assert random column address in every cycle
- Dual internal banks controlled by A11 (Bank Select)
- Programmable burst-length (1, 2, 4, 8 Full Page)
- Programmable wrap sequence (Sequential/Interleave)
- Programmable  $\overline{\text{CAS}}$  latency (1, 2, 3)
- Automatic precharge and controlled precharge
- CBR (Auto) refresh and self refresh
- $\times$ 4,  $\times$ 8,  $\times$ 16 organization
- Single +3.3 $\pm$ 0.3 V power supply
- LVTTTL compatible
- Byte control ( $\times$ 16) by LDQM and UDQM
- 2,048 refresh cycles/32ms
- Burst termination by Burst Stop command and Precharge command

**Ordering Information**

Part number	Organization (word × bit × bank)	Clock frequency MHz (MAX.)	Package

Block Diagram

## 1. Input/Output Pin Function

Pin name	Input/Output	Function
CLK	Input	CLK is the master clock input. Other inputs signals are referenced to the CLK rising edge.
CKE	Input	CKE determine validity of the next CLK (clock). If CKE is high, the next CLK rising edge is valid; otherwise it is invalid. If the CLK rising edge is invalid, the internal clock is not asserted and the $\mu$ PD4516xxx suspends operation. When the $\mu$ PD4516xxx is not in burst mode and CKE is negated, the device enters power down mode. During power down mode, CKE must remain low.
$\overline{CS}$	Input	$\overline{CS}$ low starts the command input cycle. When $\overline{CS}$ is high, commands are ignored but operations continue.
$\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$	Input	$\overline{RAS}$ , $\overline{CAS}$ and $\overline{WE}$ have the same symbols on conventional DRAM but different functions. For details, refer to the command table.
A0 - A11	Input	Row Address is determined by A0 - A10 at the CLK (clock) rising edge in the activate command cycle. It does not depend on the bit organization. Column Address is determined by A0 - A9 at the CLK rising edge in the read or write command cycle. It depends on the bit organization: A0 - A9 for x4 device, A0 - A8 for x8 device and A0 - A7 for x16 device. A11 is the bank select signal (BS). In command cycle, A11 low selects bank A and A11 high selects bank B. A10 defines the precharge mode. When A10 is high in the precharge command cycle, both banks are precharged; when A10 is low, only the bank selected by A11 is precharged. When A10 high in read or write command cycle, the precharge start automatically after the burst access.
DQM UDQM LDQM	Input	DQM controls I/O buffers. In x16 products, UDQM and LDQM control upper byte and lower byte I/O buffers, respectively. In read mode, DQM controls the output buffers like a conventional $\overline{OE}$ pin. DQM high and DQM low turn the output buffers off and on, respectively. The DQM latency for the read is two clocks. In write mode, DQM controls the word mask. Input data is written to the memory cell if DQM is low but not if DQM is high. The DQM latency for the write is zero.
DQ0 - DQ15	Input/Output	DQ pins have the same function as I/O pins on a conventional DRAM.
V <sub>cc</sub> V <sub>ss</sub> V <sub>ccQ</sub> V <sub>ssQ</sub>	(Power supply)	V <sub>cc</sub> and V <sub>ss</sub> are power supply pins for internal circuits. V <sub>ccQ</sub> and V <sub>ssQ</sub> are power supply pins for the output buffers.

2. Commands

Mode register set command

$$(\overline{CS}, \overline{RAS}, \overline{CAS}, \overline{WE} = \text{Low})$$

The μPD4516xxx has a mode register that defines how the device operates. In this command, A0 through A11 are the data input pins. After power on, the mode register set command must be executed to initialize the device.

The mode register can be set only when both banks are in idle state.

During 20 ns (t<sub>asc</sub>) following this command, the μPD4516xxx cannot accept any other commands.

Fig. 1 Mode register set command

Activate command

$$(\overline{CS}, \overline{RAS} = \text{Low}, \overline{CAS}, \overline{WE} = \text{High})$$

The μPD4516xxx has two banks, each with 2,048 rows.

This command activates the bank selected by A11 (BS) and a row address selected by A0 through A10.

This command corresponds to a conventional DRAM's RAS falling.

Fig. 2 Row address strobe and bank active command

Precharge command

$$(\overline{CS}, \overline{RAS}, \overline{WE} = \text{Low}, \overline{CAS} = \text{High})$$

This command begins precharge operation of the bank selected by A11 (BS). When A10 is High, both banks are precharged, regardless of A11. When A10 is Low, only the bank selected by A11 is precharged. A11 low selects bank A and A11 high selects bank B.

After this command, the μPD4516xxx can't accept the activate command to the precharging bank during t<sub>RP</sub> (precharge to activate command period).

This command corresponds to a conventional DRAM's RAS rising.

Fig. 3 Precharge command

**Write command**

$$(\overline{CS}, \overline{CAS}, \overline{WE} = \text{Low}, \overline{RAS} = \text{High})$$

If the mode register is in the burst write mode, this command sets the burst start address given by the column address to begin the burst write operation. The first write data in burst can be input with this command with subsequent data on following clocks.

**Fig. 4 Column address and write command**

**Read command**

$$(\overline{CS}, \overline{CAS} = \text{Low}, \overline{RAS}, \overline{WE} = \text{High})$$

Read data is available after  $\overline{CAS}$  latency requirements have been met.

This command sets the burst start address given by the column address.

**Fig. 5 Column address and read command**

**CBR (auto) refresh command**

$$(\overline{CS}, \overline{RAS}, \overline{CAS} = \text{Low}, \overline{WE}, \text{CKE} = \text{High})$$

This command is a request to begin the CBR refresh operation. The refresh address is generated internally.

Before executing CBR refresh, both banks must be precharged.

After this cycle, both banks will be in the idle (precharged) state and ready for a row activate command.

During  $t_{RC}$  period (from refresh command to refresh or activate command), the μPD4516xxx cannot accept any other command.

**Fig. 6 Auto refresh command**

**Self refresh entry command**

( $\overline{CS}$ ,  $\overline{RAS}$ ,  $\overline{CAS}$ , CKE = Low,  $\overline{WE}$  = High)

After the command execution, self refresh operation continues while CKE remains low. When CKE goes to high, the μPD4516xxx exits the self refresh mode.

During self refresh mode, refresh interval and refresh operation are performed internally, so there is no need for external control.

Before executing self refresh, both banks must be precharged.

**Fig. 7 Self refresh entry command**

**Burst stop command**

( $\overline{CS}$ ,  $\overline{WE}$  = Low,  $\overline{RAS}$ ,  $\overline{CAS}$  = High)

This command terminates the current burst operation.

**Fig. 8 Burst stop command in Full Page mode**

**No operation**

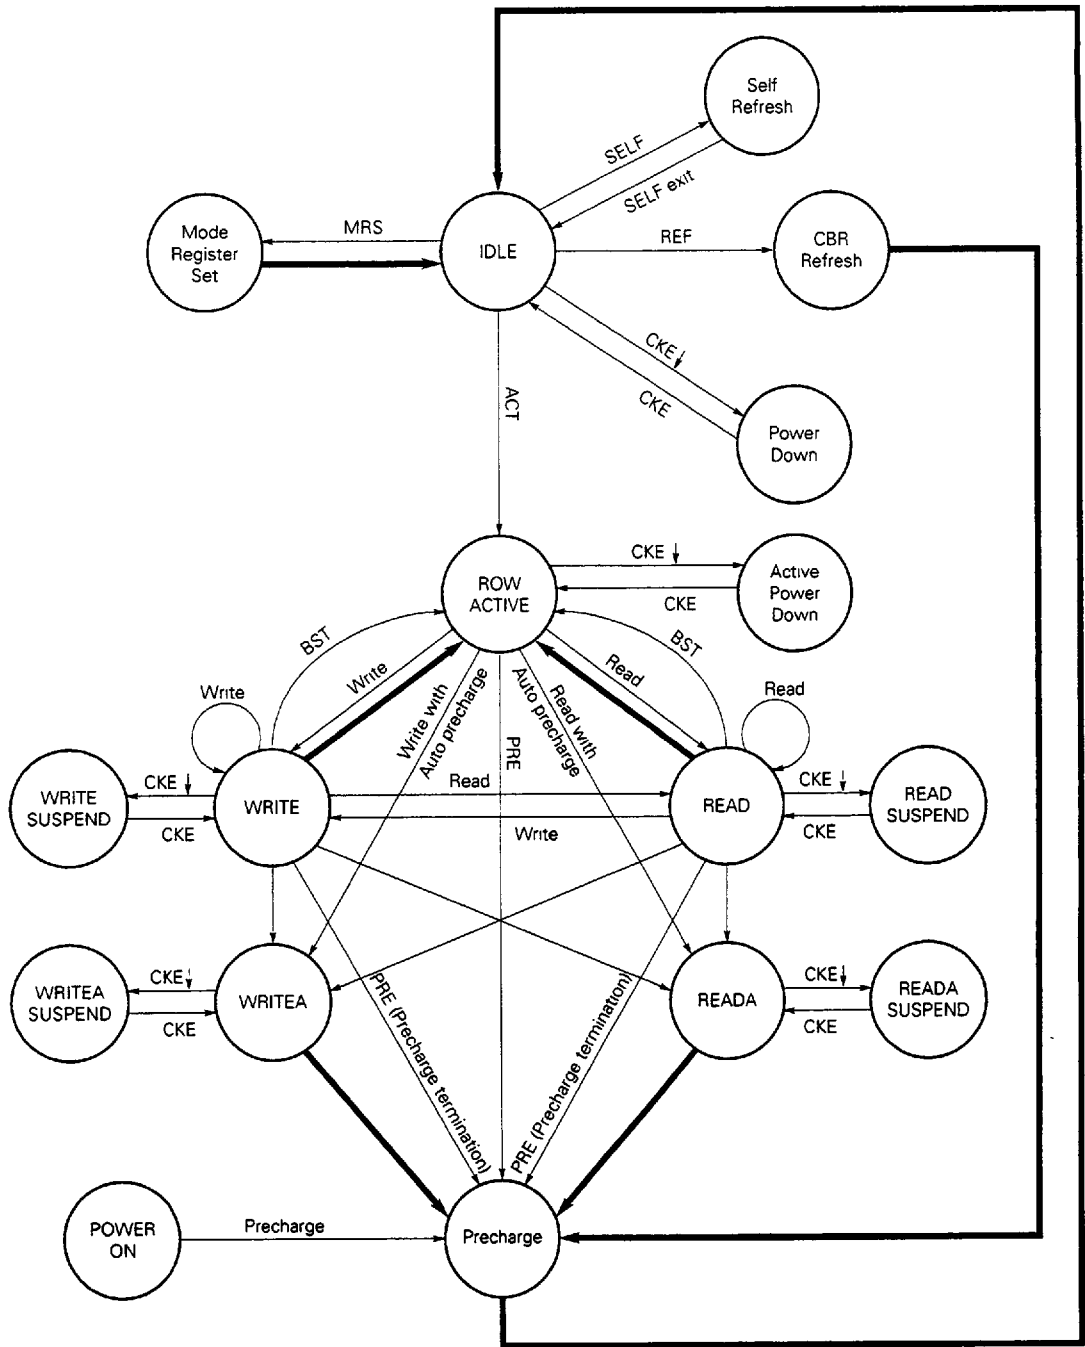

( $\overline{CS}$  = Low,  $\overline{RAS}$ ,  $\overline{CAS}$ ,  $\overline{WE}$  = High)

This command is not a execution command. No operations begin or terminate by this command.

**Fig. 9 No operation**

- Notes**
1. H: High level, L: Low level, x: High or Low level (Don't care), V: Valid data input
  2. All entries assume that CKE was active (High level) during the preceding clock cycle.
  3. If both banks are idle, and CKE is inactive (Low level), μPD4516xxx will enter Power down mode. All input buffers except CKE will be disabled.
  4. Illegal to bank in specified states; Function may be legal in the bank indicated by Bank Address (BA), depending on the state of that bank.
  5. If both banks are idle, and CKE is inactive (Low level), μPD4516xxx will enter Self refresh mode. All input buffers except CKE will be disabled.
  6. Illegal if  $t_{RCD}$  is not satisfied.
  7. Illegal if  $t_{RAS}$  is not satisfied.
  8. Must satisfy burst interrupt condition.
  9. Must satisfy bus contention, bus turn around, and/or write recovery requirements.
  10. Must mask preceding data which don't satisfy  $t_{DPL}$ .
  11. Illegal if  $t_{RAD}$  is not satisfied.

	L	L	x	x	x	x	x	Maintain clock suspend	

Notes 1. H: High level, L: Low level, X: High or low level (Don't care)

2. CKE Low to High transition will re-enable CLK and other inputs asynchronously. A minimum setup time must be satisfied before any command other than EXIT.

3. Power down and Self refresh can be entered only from the both banks idle state.

4. Must be legal command as defined in Operative Command Table.

4.6 Command Truth Table for Two Banks Operation Notes 1, 2

**Notes 1.** Logic level abbreviations

H: High level, L: Low level, x: High or low level (Don't care)

Pin name abbreviation

BA: Bank address (A11)

**2. State abbreviations**

I = Idle

A = Row active

R = Read with No precharge (No precharge is posted)

W = Write with No precharge (No precharge is posted)

RP = Read with auto precharge (Precharge is posted)

WP = Write with auto precharge (Precharge is posted)

Any = Any State

X0Y1 = Y1X0 = Bank A is in state "X", Bank B is in state "Y"

(X/Y)0Z1 = Z1(X/Y)0 = Bank A is in state "X" or "Y", Bank B is in state "Z"

3. If the  $\mu$ PD4516xxx is in a state other than above listed in the "From State" column, the command is illegal.
4. The states listed under "To" might not be entered on the next clock cycle.  
Timing restrictions apply.

**5. Initialization**

The synchronous DRAM is initialized in the power-on sequence according to the following.

- (1) To stabilize internal circuits, when power is applied, a 100- $\mu$ s or longer pause must precede any signal toggling.
- (2) After the pause, both banks must be precharged using the Precharge command (The Precharge all banks command is convenient).
- (3) Once the precharge is completed and the minimum  $t_{RP}$  is satisfied, the mode register can be programmed.  
After the mode register set cycle,  $t_{RSC}$  (20 ns minimum) pause must be satisfied as well.
- (4) Two or more CBR (Auto) refresh must be performed.

- Remarks**
1. The sequence of Mode register programming and Refresh above may be transposed.
  2. CKE and DQM may be held high until the Precharge command is asserted to ensure data-bus Hi-Z.

## 6. Programming the Mode Register

The mode register is programmed by the Mode register set command using address bits A11 through A0 as data inputs. The register retains data until it is reprogrammed or the device loses power.

The mode register has four fields:

Options : A11 through A7  
 $\overline{\text{CAS}}$  latency: A6 through A4  
 Wrap type : A3  
 Burst length: A2 through A0

Following mode register programming, no command can be asserted before at least 20 ns have elapsed.

### $\overline{\text{CAS}}$ Latency

$\overline{\text{CAS}}$  latency is the most critical of the parameters being set. It tells the device how many clocks must elapse before the data will be available.

The value is determined by the frequency of the clock and the speed grade of the device. The table on page 45 shows the relationship of  $\overline{\text{CAS}}$  latency to the clock period and the speed grade of the device.

### Burst Length

Burst Length is the number of words that will be output or input in a read or write cycle. After a read burst is completed, the output bus will become Hi-Z.

The burst length is programmable as 1, 2, 4, 8 or full page.

### Wrap Type (Burst Sequence)

The wrap type specifies the order in which the burst data will be addressed. This order is programmable as either "Sequential" or "Interleave". The method chosen will depend on the type of CPU in the system.

Some microprocessor cache system are optimized for sequential addressing and others for interleaved addressing. The table on the page 24 shows the addressing sequence for each burst length using them. Both sequences support bursts of 1, 2, 4 and 8. Additionally, sequential sequence supports the full page length.

7. Mode Register

Mode Register Write Timing

7.1 Burst Length and Sequence

[Burst of Two]

Starting Address (column address A0, binary)	Sequential Addressing Sequence (decimal)	Interleave Addressing Sequence (decimal)
0	0, 1	0, 1
1	1, 0	1, 0

[Burst of Four]

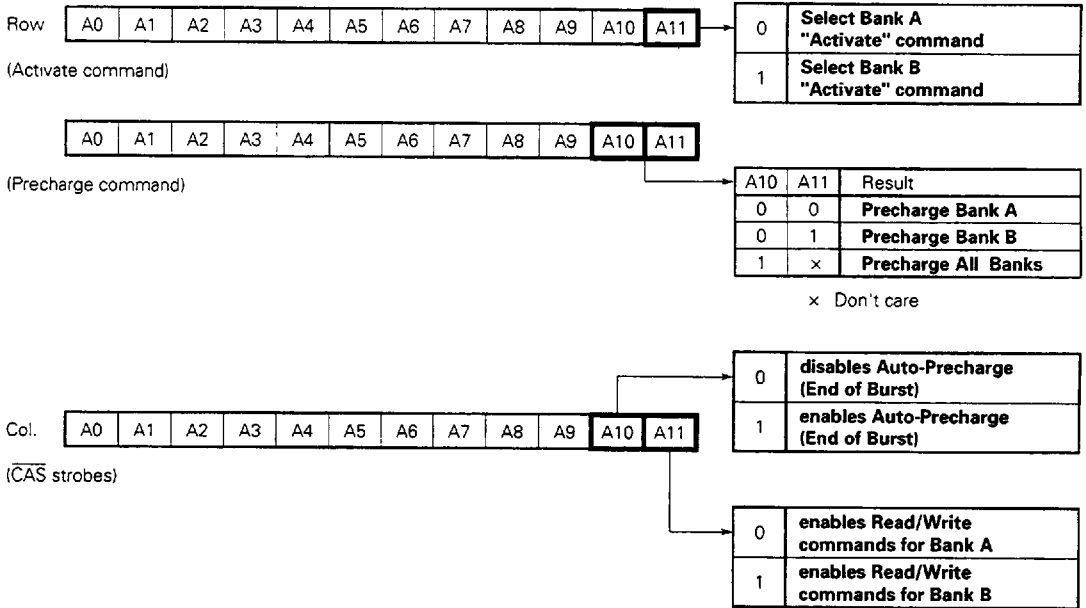

Starting Address (column address A1 - A0, binary)	Sequential Addressing Sequence (decimal)	Interleave Addressing Sequence (decimal)
00	0, 1, 2, 3	0, 1, 2, 3
01	1, 2, 3, 0	1, 0, 3, 2
10	2, 3, 0, 1	2, 3, 0, 1
11	3, 0, 1, 2	3, 2, 1, 0

[Burst of Eight]

Starting Address (column address A2 - A0, binary)	Sequential Addressing Sequence (decimal)	Interleave Addressing Sequence (decimal)
000	0, 1, 2, 3, 4, 5, 6, 7	0, 1, 2, 3, 4, 5, 6, 7
001	1, 2, 3, 4, 5, 6, 7, 0	1, 0, 3, 2, 5, 4, 7, 6
010	2, 3, 4, 5, 6, 7, 0, 1	2, 3, 0, 1, 6, 7, 4, 5
011	3, 4, 5, 6, 7, 0, 1, 2	3, 2, 1, 0, 7, 6, 5, 4
100	4, 5, 6, 7, 0, 1, 2, 3	4, 5, 6, 7, 0, 1, 2, 3
101	5, 6, 7, 0, 1, 2, 3, 4	5, 4, 7, 6, 1, 0, 3, 2
110	6, 7, 0, 1, 2, 3, 4, 5	6, 7, 4, 5, 2, 3, 0, 1
111	7, 0, 1, 2, 3, 4, 5, 6	7, 6, 5, 4, 3, 2, 1, 0

Full page burst is an extension of the above tables of Sequential Addressing, with the length being 512 (for 2M ×8 device), 1,024 (for 4M ×4 device) and 256 (for 1M ×16 device).

8. Address Bits of Bank-Select and Precharge

Precharge for Bank A

Precharge for Bank B

Precharge for All Banks

9. Precharge

The precharge command can be asserted anytime after  $t_{RAS(MIN)}$  is satisfied.

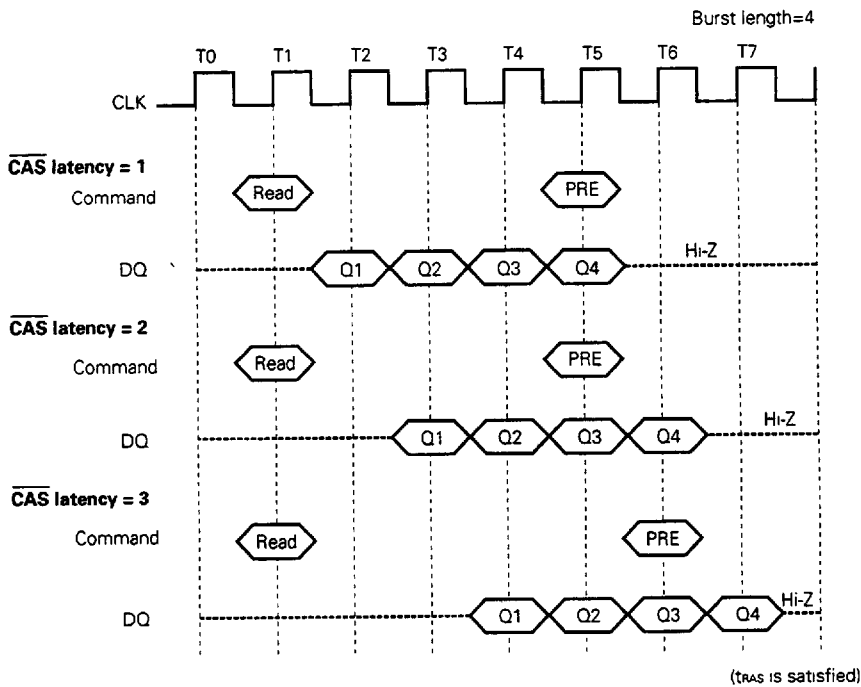

Soon after the precharge command is asserted, precharge operation performed and the synchronous DRAM enters the idle state after  $t_{RP}$  is satisfied. The parameter  $t_{RP}$  is the time required to perform the precharge.

The earliest timing in a read cycle that a precharge command can be asserted without losing any data in the burst is as follows.

It is depending on the  $\overline{CAS}$  latency.

$\overline{CAS}$  latency = 1 : At the same clock as the last read data.

$\overline{CAS}$  latency = 2 or 3 : One clock earlier than the last read data.

In order to write all data to the memory cell correctly, the asynchronous parameter "tdPL" must be satisfied. The  $t_{DPL(MIN)}$  specification defines the earliest time that a precharge command can be asserted. Minimum number of clocks are calculated by dividing  $t_{DPL(MIN)}$  with clock cycle time.

In summary, the precharge command can be asserted relative to reference clock that indicates the last data word is valid. In the following table, minus means clocks before the reference; plus means time after the reference.

$\overline{CAS}$ latency	Read	Write
1	0	+ $t_{DPL(MIN)}$
2	-1	+ $t_{DPL(MIN)}$
3	-1	+ $t_{DPL(MIN)}$

### 10. Auto Precharge

During a read or write command cycle, A10 controls whether auto precharge is selected. A10 high in the read or write command (Read with Auto precharge command or Write with Auto precharge command), auto precharge is selected and begins automatically after the burst access.

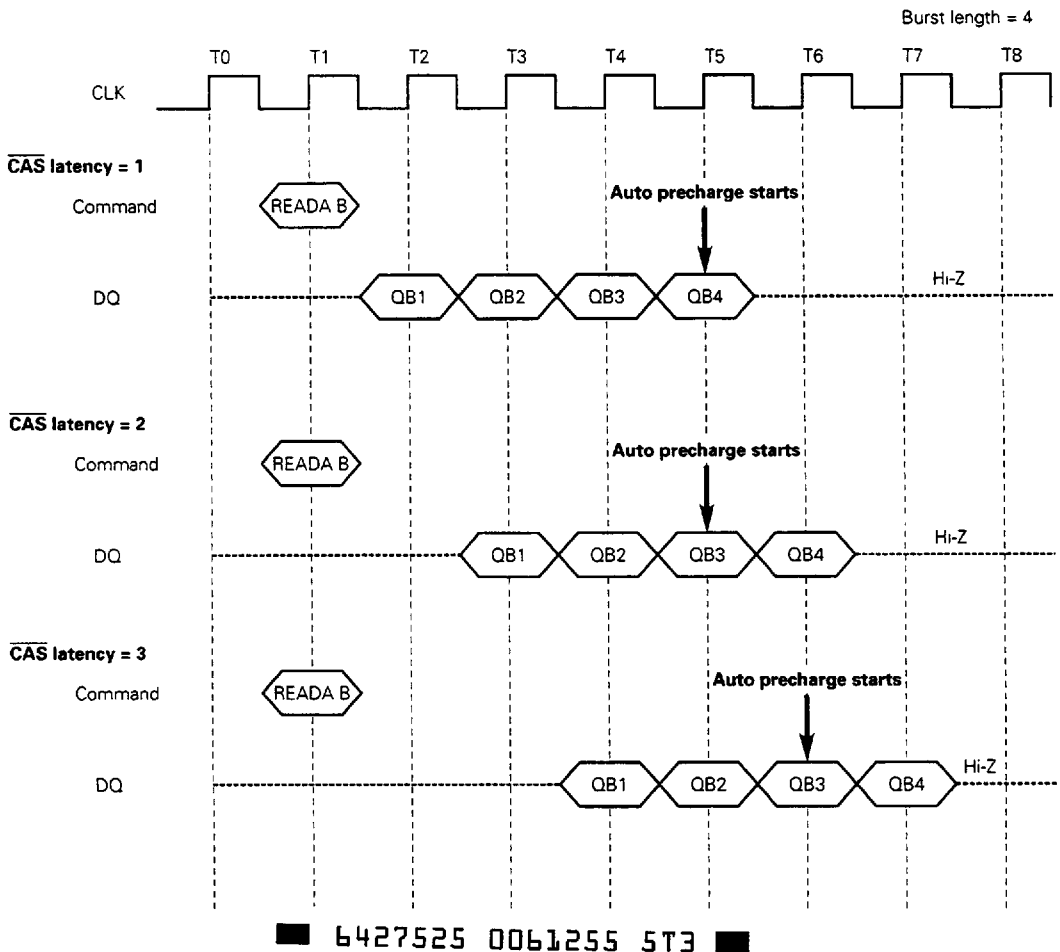

In write cycle, the t<sub>BA</sub>L must be satisfied to assert the next activate command to the bank being precharged. It is not necessary to know when the precharge starts.

When using auto precharge in READ cycle, knowing when the precharge starts is important because the next activate command to the bank being precharged cannot be executed until the precharge cycle ends. Once auto precharge has started, an activate command to the bank can be asserted after t<sub>RP</sub> has been satisfied.

The timing that begins the auto precharge cycle is depend on both the  $\overline{\text{CAS}}$  latency programmed into the mode register and whether READ or WRITE cycle.

#### 10.1 Read with Auto Precharge

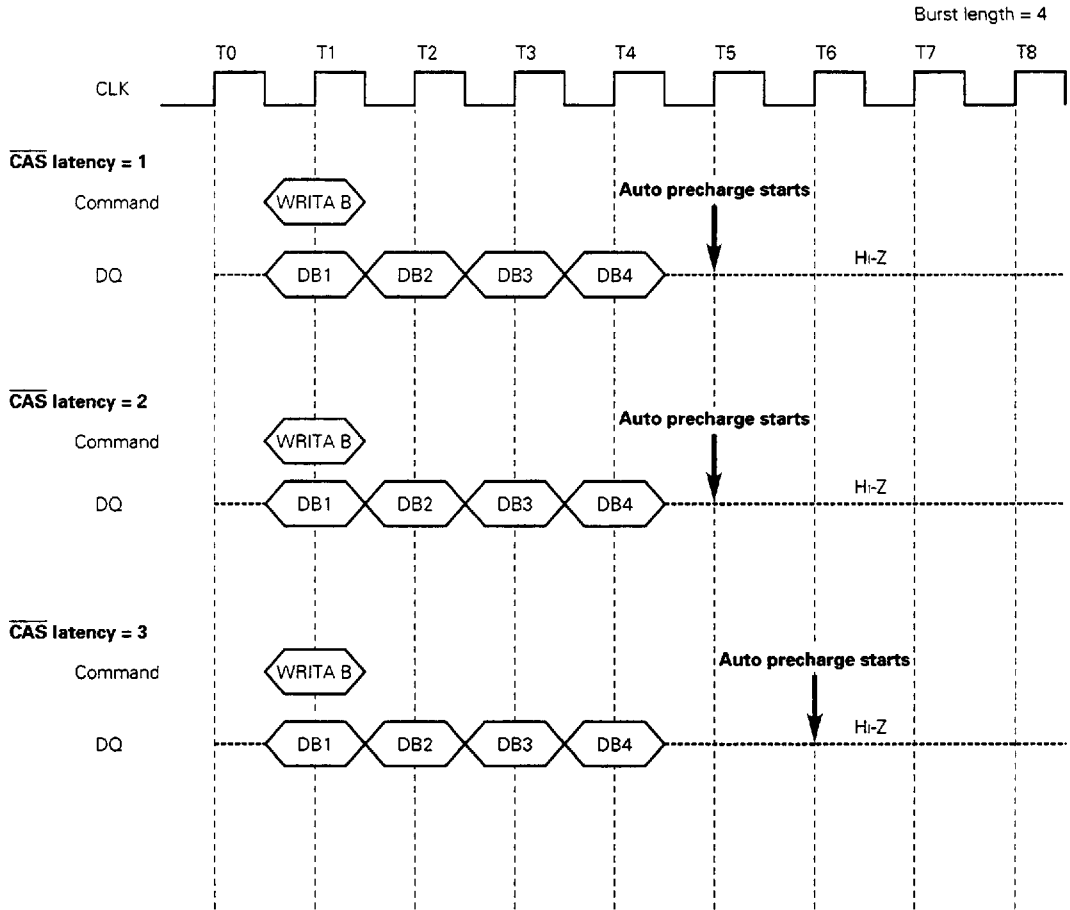

During READ cycle, the auto precharge begins on the clock that indicates the last data word output during the burst is valid ( $\overline{\text{CAS}}$  latency of 1) or one clock earlier ( $\overline{\text{CAS}}$  latency of 2 or 3).

**Remark** READA means Read with Auto precharge

**10.2 Write with Auto Precharge**

During WRITE cycle, the auto precharge begins one clock after the last data word input to the device ( $\overline{\text{CAS}}$  latency of 1 or 2) or two clocks after ( $\overline{\text{CAS}}$  latency of 3).

**Remark** WRITA means Write with Auto precharge

In summary, the auto precharge cycle begins relative to a reference clock that indicates the last data word is valid.

In the table below, minus means clocks before the reference; plus means clocks after the reference.

$\overline{\text{CAS}}$ latency	Read	Write
1	0	+1
2	-1	+1
3	-1	+2

When the  $t_{\text{RAS}}$  is not satisfied, the precharge does not start at above timing. And the precharge will start when the  $t_{\text{RAS}}$  is satisfied.

## 11. Read/Write Command Interval

### 11.1 Read to Read Command Interval

During READ cycle, when new Read command is asserted, it will be effective after  $\overline{\text{CAS}}$  latency, even if the previous READ operation does not completed. READ will be interrupted by another READ.

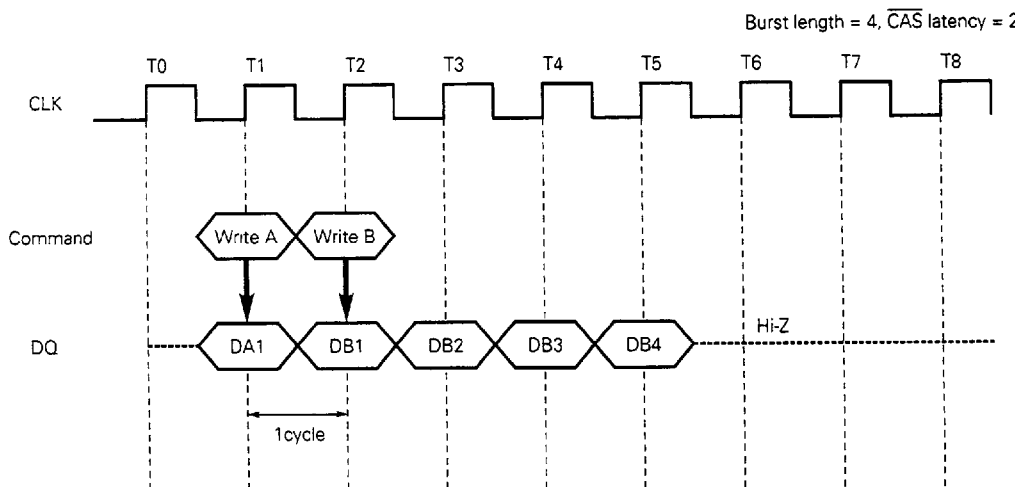

The interval between the commands is 1 cycle minimum. Each Read command can be asserted in every clock without any restriction.

### 11.2 Write to Write Command Interval

During WRITE cycle, when new Write command is asserted, the previous burst will terminate and the new burst will begin with a new Write command. WRITE will be interrupted by another WRITE.

The interval between the commands is minimum 1. Each Write command can be asserted in every clock without any restriction.

11.3 Write to Read Command Interval

Write command and Read command interval is also 1 cycle.

Only the write data before Read command will be written.

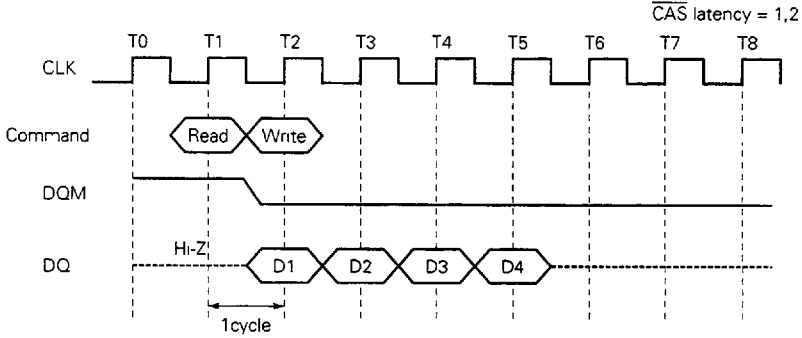

The data bus must be Hi-Z at least one cycle prior to the first Dout.

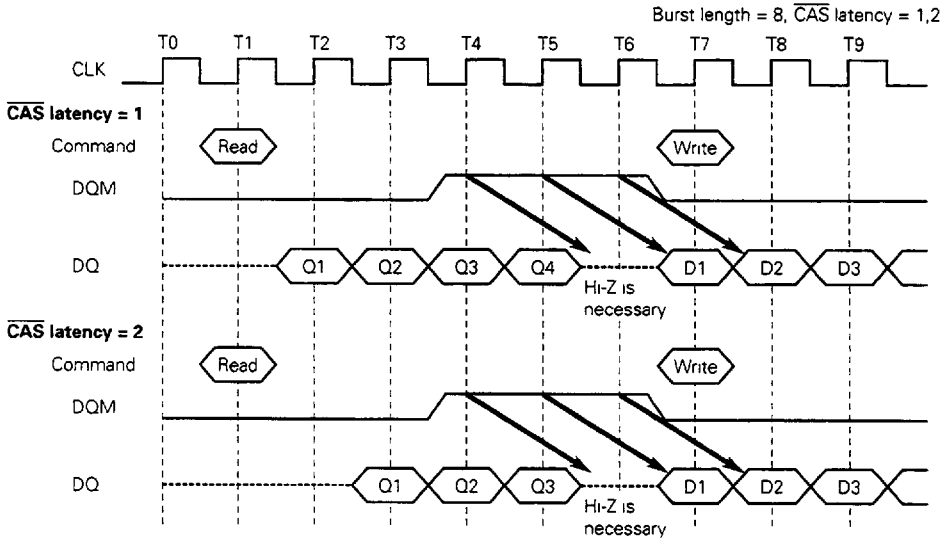

**11.4 Read to Write Command Interval**

During READ cycle, READ can be interrupted by WRITE. When the  $\overline{\text{CAS}}$  latency is 3 and then the burst length is Full page, the burst read cannot be interrupted by WRITE (A Burst Stop command (BST) or a Precharge command can interrupt).

When the  $\overline{\text{CAS}}$  latency is 1 or 2, the Read and Write command interval is 1 cycle minimum. There is a restriction to avoid data conflict. The data bus must be Hi-Z using DQM before WRITE.

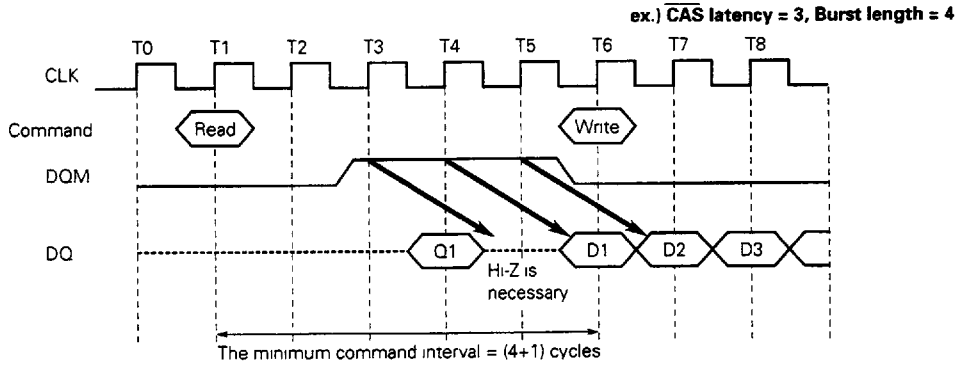

In case  $\overline{\text{CAS}}$  latency is 1 or 2, READ can be interrupted by WRITE. DQM must be High at least 3 clocks prior to the Write command.

In case  $\overline{\text{CAS}}$  latency is 3 (burst length is not Full page), READ can be interrupted by WRITE.

The minimum command interval is [burst length + 1] cycles. DQM must be High at least 3 clocks prior to the Write command.

## 12. Burst Termination

There are two methods to terminate a burst operation other than using a read or a write command. One is the burst stop command and the other is the precharge command.

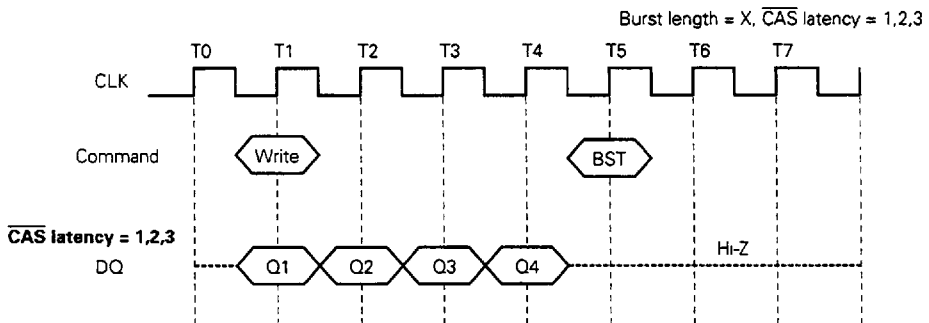

### 12.1 Burst Stop Command

During READ cycle, when the burst stop command is asserted, the burst read data are terminated and the data bus goes to Hi-Z after the  $\overline{\text{CAS}}$  latency from the burst stop command.

**Remark** BST: Burst stop command

During WRITE cycle, when the burst stop command is asserted, the burst write data are terminated and data bus goes to Hi-Z at the same clock with the burst stop command.

**Remark** BST: Burst stop command

12.2 Precharge Termination

12.2.1 Precharge Termination in READ Cycle

During READ cycle, the burst read operation is terminated by a precharge command.

When the precharge command is asserted, the burst read operation is terminated and precharge starts.

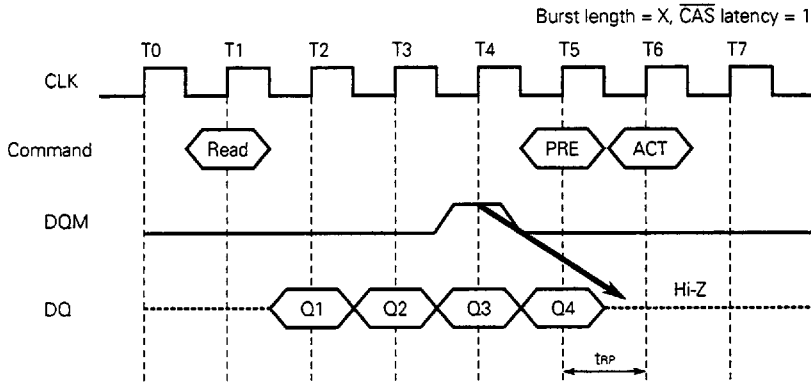

The same bank can be activated again after  $t_{RP}$  from the precharge command.

The DQM must be high to mask the invalid data.

When  $\overline{CAS}$  latency is 1, the read data will remain valid until the precharge command is asserted.

Invalid data may appear one clock after valid data out.

The DQM may be high to mask the invalid data.

When  $\overline{CAS}$  latency is 2, the read data will remain valid until one clock after the precharge command. Invalid data may appear one clock after valid data out.

The DQM may be high to mask the invalid data.

When  $\overline{\text{CAS}}$  latency is 3, the read data will remain valid until one clock after the precharge command. Invalid data may appear one and two clocks after valid data out.

The DQM may be high to mask the invalid data.

**12.2.2 Precharge Termination in WRITE Cycle**

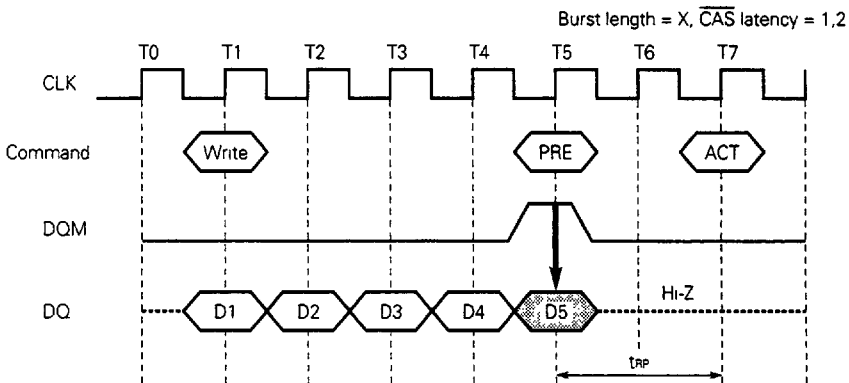

During WRITE cycle, the burst write operation is terminated by a precharge command.

When the precharge command is asserted, the burst write operation is terminated and precharge starts.

The same bank can be activated again after  $t_{RP}$  from the precharge command.

The DQM must be high to mask invalid data in.

When  $\overline{\text{CAS}}$  latency is 1 or 2, the write data written prior to the precharge command will be correctly stored. However, invalid data may be written at the same clock as the precharge command. To prevent this from happening, DQM must be high at the same clock as the precharge command. This will mask the invalid data.

When  $\overline{\text{CAS}}$  latency is 3, the write data written more than one clock prior to the precharge command will be correctly stored.

However, invalid data may be written at one clock before and the same clock as the precharge command.

To prevent this from happening, DQM must be high from one clock prior to the precharge command until the precharge command. This will mask the invalid data.

**13. Electrical Specifications**

- All voltage are referenced to V<sub>SS</sub> (GND).
- After power up, wait more than 100 μs and then, execute **Power on sequence and Auto Refresh** before proper device operation is achieved.

**Absolute Maximum Ratings**

Parameter	Symbol	Condition	Rating	Unit
Voltage on power supply pin relative to GND	V <sub>T</sub>		-1.0 to +4.6	V
Voltage on input pin relative to GND	V <sub>CC</sub> , V <sub>CCQ</sub>		-1.0 to +4.6	V
Short circuit output current	I <sub>O</sub>		50	mA
Power dissipation	P <sub>D</sub>		1	W
Operating ambient temperature	T <sub>A</sub>		0 to +70	°C
Storage temperature	T <sub>stg</sub>		-55 to +125	°C

**Caution** Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

**Recommended Operating Conditions**

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit

**15. Recommended Soldering Conditions**

The following conditions must be met for soldering conditions of the μPD4516421, 4516821, 4516161.

For more details, refer to our document "SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL" (IEI-1207).

Please consult with our sales offices in case other soldering process is used, or in case the soldering is done under different conditions.

**Types of Surface Mount Device**

μPD4516421G5, 4516821G5: 44-pin plastic TSOP (II) (400 mil)

μPD4516161G5: 50-pin plastic TSOP (II) (400 mil)

Soldering process	Soldering conditions	Symbol
Infrared ray reflow	Peak temperature of package surface: 235 °C or lower, Reflow time: 30 seconds or less (210 °C or higher), Number of reflow processes: MAX. 2 Exposure limit: 7 days <sup>Note</sup> (10 hours pre-baking is required at 125 °C afterwards)  <b>Cautions</b> 1. After the first reflow process, cool the package down to room temperature, then start the second reflow process. 2. After the first reflow process, do not use water to remove residual flux (water can be used in the second process).	IR35-107-2
VPS	Peak temperature of package: 215 °C or lower, Reflow time: 40 seconds or less (200 °C or higher), Number of reflow processes: MAX. 2 Exposure limit :7 days <sup>Note</sup> (10 hours pre-baking is required at 125 °C afterwards)  <b>Cautions</b> 1. After the first reflow process, cool the package down to room temperature, then start the second reflow process. 2. After the first reflow process, do not use water to remove residual flux (water can be used in the second process).	VP15-107-2
Partial heating method	Terminal temperature: 300 °C or lower, Time: 3 seconds or lower (Per side of the package).	—

**Note** Exposure limit before soldering after dry-pack package is opened.

Storage conditions: 25 °C and relative humidity at 65 % or less.

**Caution** Do not apply more than one soldering method at any one time, except for "Partial heating method".
