	AV_{SS}		-0.5 to +0.5	V
Input voltage	V_{I1}		-0.5 to $V_{DD}+0.5$	V
	V_{I2}	(Note)	-0.5 to $AV_{REF}+0.5$	V
Output voltage	V_O		-0.5 to $V_{DD}+0.5$	V
Output low current	I_{OL}	Per pin	15	mA
		Total, all outputs	100	mA
Output high current	I_{OH}	Per pin	-10	mA
		Total, all outputs	-50	mA
Operation temperature	T_{opt}		-10 to +70	$^\circ\text{C}$
Storage temperature	T_{stg}		-65 to +150	$^\circ\text{C}$

Note: Pins of P70/ANI0-P75/ANI5, P66/ $\overline{\text{WAIT}}$ /ANI6, and P67/ $\overline{\text{REFRQ}}$ /ANI7 are used as A/D converter input pins. However, the absolute maximum rating of V_{I1} must also be satisfied.

Caution: If even one parameter exceeds the absolute maximum rating, even instantaneously, the quality of the product may be damaged. The absolute maximum rating is a rated threshold value at which the product can be physically damaged. Be sure to use the product within the absolute maximum ratings.

Caution: To use the clock oscillator, wire the portions surrounded by [] to avoid wiring capacitance affection, etc., as follows:

- Make wiring as extremely short as possible.
- Do not cross the oscillator and any other signal line over each other.
- Do not put the oscillator near any line where high current fluctuates.
- Be sure to place oscillator capacitor ground point in the same potential as the V_{SS} pin.
Do not connect to any ground pattern where high current flows.
- Do not take out any signal from the oscillator.
