

**Features**

- 168 Pin Unbuffered 16,777,216 x 64 bit Organization SDRAM Modules
- Utilizes High Performance 8M x 8 SDRAM in TSOPII-54 Packages
- Fully PC Board Layout Compatible to INTEL'S Rev 1.0 Module Specification
- Single +3.3V (± 0.3V) Power Supply
- Programmable  $\overline{\text{CAS}}$  Latency, Burst Length, and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- All Inputs, Outputs are LVTTTL Compatible
- 4096 Refresh Cycles every 64 ms
- Serial Present Detect (SPD)
- SDRAM Performance

**Description**

The V436416S04V(C)TG-10PC memory module is organized 16,777,216 x 64 bits in a 168 pin dual in line memory module (DIMM). The 16M x 64 unbuffered DIMM uses 16 Mosel-Vitellic 8M x 8 SDRAM. The x64 modules are ideal for use in high performance computer systems where increased memory density and fast access times are required.

**Pin Names**

A0–A11	Address Inputs
I/O1–I/O64	Data Inputs/Outputs
RAS	Row Address Strobe
$\overline{CAS}$	Column Address Strobe
$\overline{WE}$	Read/Write Input
BA0, BA1	Bank Selects
$\overline{CKE0}$ , $\overline{CKE1}$	Clock Enable
$\overline{CS0}$ – $\overline{CS3}$	Chip Select
CLK0–CLK3	Clock Input
DQM0–DQM7	Data Mask
VCC	Power (+3.3 Volts)
VSS	Ground
SCL	Clock for Presence Detect

SDA	Serial Data OUT for Presence Detect
SA0–A2	Serial Data IN for Presence Detect
CB0–CB7	Check Bits (x72 Organization)
NC	No Connection
DU	Don't Use

**Serial Presence Detect Information**

A serial presence detect storage device - E<sup>2</sup>PROM - is assembled onto the module. Information about the module configuration, speed, etc. is

written into the E<sup>2</sup>PROM device during module production using a serial presence detect protocol (I<sup>2</sup>C synchronous 2-wire bus)

**Notes:**

1. The specified values are valid when addresses are changed no more than once during  $t_{CK}(\text{min.})$  and when No Operation commands are registered on every rising clock edge during  $t_{RC}(\text{min.})$ . Values are shown per module bank.
2. The specified values are valid when data inputs (DQ's) are stable during  $t_{RC}(\text{min.})$ .
3. All AC characteristics are shown for device level.  
An initial pause of 100  $\mu\text{s}$  is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
4. AC timing tests have  $V_{IL} = 0.4\text{V}$  and  $V_{IH} = 2.4\text{V}$  with the timing referenced to the 1.4V crossover point. The transition time is measured between  $V_{IH}$  and  $V_{IL}$ . All AC measurements assume  $t_T = 1 \text{ ns}$  with the AC output load circuit shown. Specific  $t_{ac}$  and  $t_{oh}$  parameters are measured with a 50 pF only, without any resistive termination and with a input signal of 1V / ns edge rate between 0.8V and 2.0V.

5. If clock rising time is longer than 1 ns, a time  $(t_T/2 - 0.5)$  ns has to be added to this parameter.
6. Rated at 1.5V
7. If  $t_T$  is longer than 1 ns, a time  $(t_T - 1)$  ns has to be added to this parameter.
8. Any time that the refresh Period has been exceeded, a minimum of two Auto (CBR) Refresh commands must be given to "wake-up" the device.
9. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to  $t_{RC}$  is satisfied once the Self Refresh Exit command is registered.
10. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.
11.  $t_{DAL}$  is equivalent to  $t_{DPL} + t_{RP}$ .
